Vol. LIV — January 3, 1920 — No. 1

The Greatest Story Ever Told

TIME was when the stream of gold from California's mines saved the Union. An equal claim cannot be made as to her wonderful production of crops during the recent war, though they were a great factor in the feeding of the world. Great as they were in the more strenuous years of the war, last year's exceeded all previous records. The chronicle of this production has been characterized as "the greatest story ever told." While it exceeded in tonnage, the acreage was slightly less than that of the two preceding years, but its value was beyond all precedent and expectation. The total acreage of field crops harvested in 1919 was 5,881,340; in 1918, 5,914,200. Expressing the production in tons, the total for 1919 was 7,627,256, this as against 6,355,668 in 1918.

In fruit crops the increase was still greater. The fruit crops for 1919 aggregated 2,071,525 tons worth an average of $113 per ton; for 1918, 1,766,675 tons worth an average of $101 per ton. Again, oats and barley decreased slightly in production because of material increase in wheat and rice. Our wheat production in 1919 was 215.1 per cent of that of 1918; rice, 107.4 per cent; hay, 143.3 per cent; cotton, 104.05 per cent; hops, 143 per cent; apples 131 per cent; peaches, 147 per cent; pears, 106 per cent; prunes, 288 per cent; apricots, 121 per cent; almonds, 151 per cent; walnuts, 107 per cent; lemons, 140 per cent; raisins, 107 per cent. Decrease was shown in the production of oranges, 94 per cent of last year's; and potatoes, 88 per cent. The most serious slump, however, was in beans. The bean crop suffered because of reduced planting, because of unfortunate weather conditions (resulting in the abandonment of 20,000 acres which had been planted), and the grower because of juggling of the markets by selfish interests, but more because of his own lack of cooperation. The grower will benefit, however, by the lesson he has learned during the past 12 months, and another year will show a marked change in methods of marketing.

Another one of the producing interests which has failed to take advantage of the present conditions and reap largest returns is that of the sugar beet growers. The value of sugar beets produced during the past year is nearly $11,000,000 as compared with $8,500,000 the preceding year, but the increase might have been still greater had the true cooperative spirit prevailed among the growers. The weather besides was unfavorable; 130,000 acres were planted but only 110,900 harvested. The crop amounted to 821,000 tons from which 127,900 tons of sugar was obtained.

Peaches, prunes and raisins made the most striking showing among the fruits. The peach crop made a record, the state producing 38,000 tons of dried peaches alone. Shipments of fresh peaches out of the state totalled 2,774 carloads. Because of previously made contracts the price per ton to the grower does not average as high as for other fruits, in fact, not much above $60 per ton. California produced 34.3 per cent of the peaches of the United States; nearly 130,000 tons of prunes; 67,000 tons of this in the Santa Clara district, 30,000 tons in the Sacramento and Napa Valleys, 20,000 tons in Sonoma, Lake and Mendocino Counties and 12,000 tons in the San Joaquin Valley. It is estimated that nearly 40,000 tons was cut from the yield of raisins because of lack of irrigation water in July and August. As it was, however, the average was 1,960 pounds per acre and the total production not far from 180,000 tons. Shipments of table grapes totalled 19,017 carloads.

Truly, the most wonderful story ever told, and, as we have noted, the golden returns are due, to a large extent, to cooperation, and cooperation another year will be far more effective. Note the "Outlook" in the Cultivator last week where Cultivator readers of the northern, the central and the southern parts of the state gave of their opinions as to the possibilities of the coming year's opportunities.

May we not be able another year to chronicle as great a story of the state's production?

6 Exclusive Features in the MOLINE UNIVERSAL TRACTOR

Exclusive Features:

1. Does *all field work* including cultivating and harvesting.
2. Both tractor and implement operated by *one man.*
3. Tractor and implement form *one unit.*
4. Operator sits on implement at center of all controls of tractor and implement.
5. Operator sees his work. "Foresight is better than hindsight."
6. Tractive power in front of work, operator behind it.

Exclusive Results:

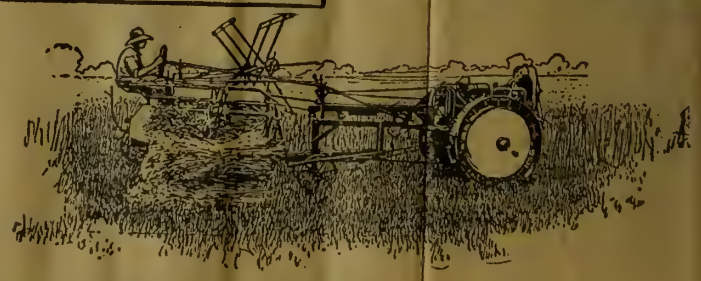
1. No duplication of any wor[illegible] by horses.
2. A saving in labor.
3. Entire outfit turns short, b[illegible]ks and makes fence corners proc[illegible]e.
4. Ease of operation.
5. Better work.
6. Power used as horses are u[illegible]l.

The Power of a Correct Principle

The principle of doing all field operations with one man sitting where he can watch his work is correct, or farming has always been done backward, and the operator would always have ridden or led his horses instead of driving them.

The Moline Universal Tractor places the power of nine big horses where the horses stood—is driven just like horses are driven, from the seat of the implement, and hitched up to the implement just like horses are hitched.

***Note*—If desired you can use the "drag behind" or horse drawn implements you now have the same as with other types of tractors.**



See your Moline Dealer or write our nearest branch for full information

The Luscious Japanese Persimmon

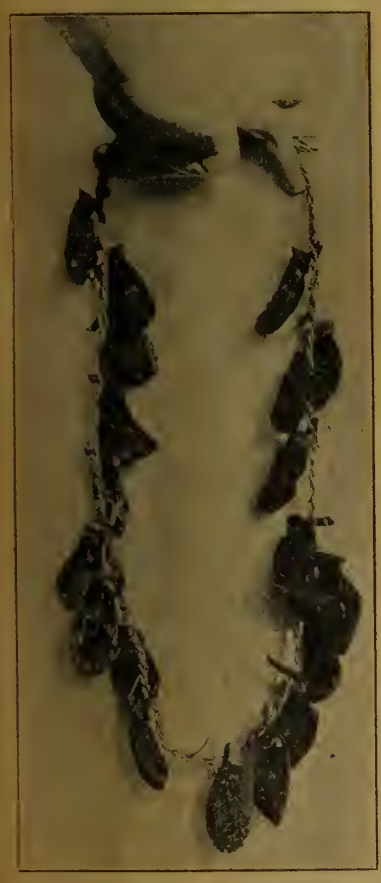
By Robert W. Hodgson

AMONG California's wealth of horticultural products of especial interest at this season of the year is the persimmon. And when we speak of persimmons in California we mean the Japanese or Kaki persimmon, for it is not only a fruit superior in every way to the Eastern article, but it is practically the only persimmon now grown in California.

Although introduced into the United States from Japan in 1856 by Commodore Perry and into the Golden State as early as 1870, persimmon culture on a commercial scale has not been practiced to any considerable extent until within the last eight or ten years, the tree being found quite commonly as a dooryard or garden proposition but not being planted much in orchard form. At the time of the last census it was estimated that there were enough such bearing trees in the state to make some hundred acres. At the present time, however, undoubtedly there are several hundred acres of bearing and young orchards to be found, and interest in this fruit is growing all the time.

The Apple of Japan

Just why the persimmon was slow in gaining a place in the estimation of Californians it is difficult to say, as a ripe, luscious persimmon is excelled by few fruits. In Japan the persimmon bears the same relation to horticulture in general that the apple does to fruit growing in America. It



No Waste Crop With Persimmons
The dried persimmon is the prune of Japan. String of dried persimmons.

is the universal and popular fruit, having a very wide variety of uses. The juice from the unripe fruits serves as a stain for furniture, while the wood itself is quite valuable for fancy work. An extensive industry has been built up in the drying of persimmons in Japan, and after having tasted the dried article the writer must confess to having found it a most delectable product. The tree is easily grown, is free from serious diseases and insect pests and is remarkably prolific in California. The fruit is very attractive in appearance, ships well to both local and distant markets, and is almost universally liked if eaten in the proper condition.

No doubt one reason why this fruit has not gained more rapidly in popular esteem is the general lack of knowledge of its good qualities, as well as the fact that it has often been placed on sale before properly ripened. During the past few years, however, there has been a marked increase of interest in new fruits, and this, coupled with the fact that recently a persimmon stock has been introduced which makes the tree grow almost as freely and thriftily as the peach, makes the future for persimmon culture in California decidedly promising.

Although succeeding well in California the persimmon winter kills badly in locations where winter temperatures approach zero. In this respect it resembles the figs to a marked degree. It will likewise endure a great deal of summer heat without injury, good crops being borne in the Imperial Valley and other regions of extreme summer heat.

While the persimmon is remarkably resistant to adverse conditions in general, it appreciates good care and a rich soil. The best soil for persimmons in California seems to be a rather heavy loam or clay, well supplied with organic matter and provided with good underdrainage.

The stock referred to above is one of Chinese origin introduced into California a number of years ago by the late Frank Meyer and known as the lotus stock. It is an exceedingly vigorous and thrifty grower and makes a most congenial union with the Kaki persimmon. Trees on this stock are very much better growers and more satisfactory in every way than those on either the Kaki or Eastern root. Trees of suitable variety on this stock are now available in limited quantity from several nurseries.

The trees should be set from 18 to 20 feet apart, depending somewhat upon the variety, some being more spreading in habit than others. The care of a persimmon orchard does not differ to any extent from the care of other deciduous orchards. Irrigation, as well as cultivation, should be governed by the needs of the trees and existing soil conditions.

But Little Waste in the Persimmon
The persimmon is a coming fruit in California. This is a choice Kaki persimmon.

Pollination

In the past, and especially in other parts of the United States as well as Japan, it has frequently been reported that the trees often fail to set fruit, although a large amount of bloom is produced. On painstaking investigation it was found that the persimmon bears two distinct kinds of flowers, the male and the female, and certain varieties must carry both, either on the same tree or at no great distance from each other, if fruit is to be set. Others will set fruit if no male blossoms whatever are borne, the fruits being seedless, but if male flowers are produced the fruits contain seed. In certain varieties, whether seedless or not, the flesh is always light colored, and these varieties are called Pollination Constants. In others, known as Pollination Variants, if the fruit contains seed, the flesh is dark, but if seedless it is light colored. Until cleared up by investigation these confusing facts made it almost hopeless to distinguish between different varieties or to identify the same variety under different conditions.

There is little need to worry about pollination in California, however, as practically every variety which has been fruited has been found either not to require pollination or to carry male flowers. This condition has been found to apply to even the notorious shy bearing varieties of other sections.

Artificial Ripening

Most persimmons must be allowed to ripen until all astringency is lost before they are edible. And when they approach this condition they are so soft that it is impossible to ship them any distance. At present this difficulty is met by picking the fruit while still firm and hard but sufficiently developed and matured so that it continues to ripen in transit and storage. If picked too soon, instead of ripening the fruit shrivels and wilts and is worthless.

The Japanese have for years been practicing a method of treating hard persimmons so that the astringency is removed and the fruit rendered of excellent eating quality while still firm. This method is to enclose the persimmons in an airtight sake cask which has but recently been emptied. The alcoholic fumes act upon the tannin and render the fruit non-astringent without destroying its consistency. In 1905 Geo. C. Roeding first satisfactorily ripened the persimmon in California by this method. Since that time a number of methods for artificial ripening have been perfected. It was found that merely subjecting them to an atmosphere of carbon dioxide for several days would result in the loss of astringency.

Natural Non-Astringent Varieties

More recently it has been found that there are a number of naturally non-astringent varieties. Some of these, when seedless, however, are found to be astringent while others are always non-astringent. The fruits may be eaten out of hand when as solid as an apple and are very good indeed. Among the best of such varieties is the Hyakume, a variety now being grown somewhat in California and deserving of greater popularity on account of its regular habit of heavy yielding, and another is the Tamopan.

Persimmons Make a Handsome Orchard
Commercial persimmon orchard in Placer County.

Other Varieties for California

Among the best varieties for California are the Hachiya and the Tanenashi. The former is the principal drying variety of Japan and is the largest and finest in appearance of any fruit in California. It is an early and a heavy bearer and is always light fleshed and astringent until fairly soft.

Continued on Page 27.

Agricultural News Notes of the Pacific Coast

Northern California

The Sacramento delta is now shipping heavily of celery.

At Colusa 3,000 bags of rice sold for $7.87 a bag, a new record price.

The 1919 fruit shipments from Newcastle, Placer County, were 526 carloads.

Sonoma County has 3,800 cows under test to determine their dairy value.

San Francisco reports a marked advance in the price of potatoes and onions.

The state university reports Canada thistle gaining a foothold in Humboldt, Lake and Marin Counties.

San Francisco has been given $250,000 for the establishment of an aquarium in Golden Gate Park.

Last week two carloads of seedless raisins were shipped to Europe from College City, Colusa County.

San Francisco is fighting for milk at 13 cents a quart and against the distributor's price of 16 cents.

At the port of San Francisco in October there were examined 140,000 pieces of horticultural imports.

Yuba County bean growers will plant and harvest a crop of peas this year before time to plant beans.

The board of directors of the Glenn County Fair Association has chosen dates, September 27 to October 2.

The Pacific Rice Growers Association will build a string of warehouses throughout the Sacramento Valley.

The farm bureau of Butte County will handle that county's fall wool clip and ship it on January 6, 1920.

San Francisco reports an advance of 20 cents a barrel on family flour in one day, the present price being $12.30.

Three are dead in one family at San Rafael, Marin County, as the result of eating poisoned canned string beans.

Sacramento Valley livestock men are elated at the winnings made by California pure breds at the Chicago International.

Growers of Concord grapes at Martinez, Contra Costa County, report sales during the past season averaging $45 per ton.

The California Grape Grower is the title of a new publication put forth by the grape association from its San Francisco office.

Over 50 county and local cattlemen's associations were represented in the annual meeting recently held in San Francisco.

A Bartlett pear tree at Camino, El Dorado County, six years old, produced eight boxes of fruit and a Winter Nelis of same age, nine boxes.

Plumas-Tahoe Cattlemen's Association recently met and levied an assessment of five cents per head to create a fund for cattle protection.

The pioneer orange tree of Chico, Butte County, yielded a return of $150 and many were too high to pick. The tree stands in front of a hotel.

The Chico chamber of commerce entertained the fruit growers and nurserymen in annual convention, paid all bills and had eight cents remaining.

Two ships recently arriving at San Francisco brought large consignments of eggs from China and Yokahama. Another steamer brought 300 cases of egg yolk.

Central California

Apricot pits are now bringing $60 a ton at Fresno.

North Fresno is completing a $2,000,000 sewer system.

Fresno County grew 20,000,000 pounds of figs in 1919.

A Fresno packer estimates that the car shortage cost Fresno County growers $5,000,000.

An Eastern firm will plant 140,000 almond trees near San Miguel, San Luis Obispo County.

Kern County last year produced 46,318,405 barrels of oil in 1919, coming from 5,279 wells.

In the state egg laying contest at Santa Cruz a White Leghorn has laid 23 eggs in four weeks.

Monterey County produced about 210,000 tons of sugar beets which averaged the growers $11.50 a ton.

Bakersfield will build a $500,000 civic auditorium in memory of the service men from Kern County.

Fresno County grew 185,000 pounds of fine Turkish cigarette tobacco last year but the market is slow and poor.

At Woodlake, Tulare County, a four year old grapefruit orchard returned the grower $400 an acre, at $4.60 a box.

The cherry growers of Santa Clara Valley organized at San Jose recently on account of poor prices for the 1919 crop.

A 20 acre Malaga vineyard near Turlock, Stanislaus County, returned the owner $5,000 as against $3,000 last year.

Price cutting bakers in Modesto, Stanislaus County, have brought the price of loaves from 16 cents to ten cents.

Dairymen of Fresno County have this year received $3,116,190 for their products as against $2,000,000 for last year.

The Fresno farm bureau is conducting a membership campaign to get a representation of 100,000 more acres by March 1.

Olive growers who have investigated deaths in the East charged to the eating of ripe olives find that olives were not the cause.

Horticultural Commissioner Beers of Merced County suggests that corn stalks be used in protecting young fig trees from freezing weather.

The California Vegetable Union is making arrangements to handle large quantities of sweet potatoes grown in the northern end of the San Joaquin Valley.

It is estimated that 30,000 acres of cotton will be planted between Bakersfield in Kern County and Corcoran in Kings County, as against 4,000 acres in 1919.

Four Watsonville apple packers were recently fined $50 each for violation of the apple standardization law by marking boxes "Fancy" that contained wormy apples.

The Newman Creamery and Manufacturing Company has started up its machinery for a new dry milk factory. This is one of the largest dry milk factories ever built.

The Milk Producers of Central California recently met at Modesto. Only 175 members were present and [illegible] transactions were postponed [illegible] majority membership should b[illegible] ent.

Southern California

Hemet estimates its present orange crop at 75 carloads.

A farm tractor institute will be held at Fullerton, January 5-24.

The grapefruit shipped from Imperial this year will total 20 cars.

Fullerton, Orange County, has purchased a 30 acre city park for $60,000.

An extensive acreage of cotton is to be planted at Perris and a cotton gin built.

The Oxnard Walnut Growers Association paid its members $275,000 for the 1919 crop.

The acreage of cantaloupes for the Imperial Valley for 1920 is estimated at 26,000.

Oxnard bean growers are up in arms over the great number of petty thefts of sacked beans.

The Imperial Valley growers are worried over a shortage of shook for boxes and crates.

The Orange County poultry show will be held at Huntington Beach some time this month.

A new town site has been laid out near Yucaipa, San Bernardino County, and is called Appeloma.

Riverside has a new date packing house, receiving the fruit from Indio in the Coachella Valley.

The California fish and game commission will build a laboratory at San Pedro, Los Angeles City.

Orange County will soon vote on bonds to the amount of $200,000 to provide money for good roads.

The 1918 acreage of spinach in the Imperial Valley was 165; this year it is 1,200. The pea acreage is 860.

Riverside reports the Corona and La Habra lines of the Pacific Electric will be joined by a connecting link.

More than 1,700 tons of walnuts were shipped from the Hemet, Riverside County, packing house this season.

Palo Verde Valley cotton growers have organized a corporation to erect a cotton gin in Blythe before next season.

The prune growers of Banning, Riverside County, are driving for an increased membership to support the state organization.

A syndicate of Los Angeles men has bought 112 sections of non-agricultural land from the Southern Pacific and will drill for oil.

The Lemon Growers Association at Upland, San Bernardino County, will build another packing house of the same size as present one.

Snow in Bear Valley, San Bernardino County, is a foot deep and harvesters of Christmas trees experienced great difficulty in hauling them out.

Coal mining will be resumed at Alberhill, Riverside County, the coal burned by a gas company turned into gas and a gas heating system developed.

The growers cooperative cannery at Elsinore packed during the past season 168,000 cans of apricots, 240,000 cans of tomatoes and dried 210 tons of apricots.

An inspector from the United States department of agriculture will canvass the Imperial Valley cotton fields and grant certificates of grade for seed purposes.

The Coast and General

Coleman, Florida, is the center of 600 acres of early cabbage.

Gold Hill, Oregon, shipped 60 carloads of apples and pears in 1919.

Grant County, Oregon, shipped 300 carloads of fruit the past season.

Florida bean shipments are reported heavy, quality only fair, and demand poor.

The Oregon state hospital made a profit in 1919 of $10,000 from 4,000 hens.

The early cabbage crop about New Orleans is less than 50 per cent of normal.

Eighty acres of seed potatoes of 1919 were certified by the state board of Oregon.

Wapato, in the Yakima Valley, Washington, grows 3,600 acres of red clover for seed.

Kansas City dealers report heavy receipts of chilled or frozen potatoes, involving much resorting.

A new railroad is projected, to run from Ajo, Arizona, 90 miles south to San Jorges Bay, Sonora, Mexico.

A trapper at Burns, Oregon, sold 650 coyote skins for $16.50 each and got $3 bounty, a total of $12,512.

Clallam County, Washington, will next spring liberate young turkeys in the forests, hoping to stock them.

The Rocky Mountain Fruit Jobbers Association will hold their 1920 convention in San Francisco, January 30.

The potato crop of the Yakima Valley, Washington, will total 1,500 carloads, half of the 1918 output, frost damage being largely responsible.

Four feet of snow in the upper Hood River Valley, Oregon, falling on roofs and banking up walls, saved stored apples in a 24 below zero cold snap.

Citrus growers expect that the shipment of oranges and grapefruit this season will run to close to 150 carloads, or about double the shipments of last season.

Washington apple shippers put false floors in box cars with six inches of sawdust beneath, cover the walls with building paper and a four inch space is filled with sawdust.

In Puyallup Valley, Washington, last year's crop included 7,000,000 pounds of blackberries, 240,000 pounds of loganberries and 11,000,000 pounds of raspberries and strawberries.

Cotton picking throughout Arizona has progressed favorably and is well along for the season, with the prospect that if no more bad weather ensues the crop will be practically all gathered by the first of January.

The Arizona college of agriculture is planning feeding experiments with steers to be conducted at the Mesa experiment station farm. These tests will cover a period of several months and with four or five lots of steers The principal work attempted will be to determine the relative value of cotton seed products and alfalfa hay with silage.

A cotton school has been held under the direction of County Agent H. C. Heard and other officials of the state experiment station, in several sections of the Salt River Valley, Arizona, dur the past few weeks. Expert farmers and members of the station staff have taken up different phases of the cotton production problems and discussed them thoroughly.

Gopher Control

By E. R. de Ong

WITH the coming of the first heavy rains the most favorable opportunity of the year is offered for poisoning gophers in the orchard and field. Green feed is scarce in most places and vegetation will be slow in starting on account of low temperatures. Hence we will have opportunity for a month or more of fighting gophers when natural food is scarce.

The cheapest method of attack for large areas is poisoning, using freshly prepared vegetable or dried fruit bait made up similar to squirrel poison. Dried prunes or raisins may be used for the bait or chopped vegetables made up as follows:

Sweet potatoes, parsnips, or carrots, eight quarts; flour paste, one-half pint; strychnine alkaloid, powdered, one-fourth ounce; saccharine, one-sixteenth ounce.

Chop the vegetables or cut them with a knife into one inch cubes. Make a thin paste of flour and water and boil for a few minutes. Stir the strychnine and saccharine into one-half pint of the cooked paste and put it over the chopped vegetables, stirring until each piece is coated. Two or three of these cubes are to be dropped in each runway. The alkaloid form of strychnine should be used in preference to the sulphate as the former is but slightly soluble in water and remains largely on the outside of the bait, leaving the center sweet. The saccharine is used to disguise partially the bitterness of the strychnine.

For locating the underground burrows a simple tool may be used which can be made at any blacksmith shop. This is a shank of steel three-quarters of an inch in diameter and about 15 inches long, pointed at the lower end. This is fitted into a wooden or iron handle three feet long, the upper end of which is tapered slightly, to be used in enlarging the openings made into the runway. To aid in sinking the probe into the ground a foot piece should be welded on to one side of the steel rod. To use this tool it is necessary for the ground to be wet down to the ordinary depth at which the gophers are working, usually from three to eight inches below the surface. Sink the probe into the ground ten or 15 inches from the gopher hill, continuing the work until the burrow is located, which will be recognized by a sudden dropping of the probe. If necessary enlarge the opening into the runway with the blunt end of the handle, then drop in the bait and close the hole with the foot. The operator will soon become expert in locating the runways so that where gophers are abundant one man may bait hundreds of runs in a single day. One piece of seven acres of heavily infested alfalfa land has been covered by one man in a day and a half.

Poisoning is more successful from late summer, after green food has become scarce, until grass starts in the fall or winter, depending on rainfall and temperature. It should be delayed until the top layer of ground is thoroughly wet, not only to facilitate operations, but because after the heavy rains begin gophers have a tendency to migrate into fence rows or the uncultivated strip along driveways, which greatly reduces the amount of ground necessary to cover. One thorough application in such places should kill 70-90 per cent or more of the gophers. After another rain the ground can be gone over again and any fresh hills poisoned. Alfalfa is not as successfully treated as orchard or bare land on account of the abundance of succulent food.

If only a small amount of bait is necessary it can then be prepared in a much simpler manner. Cut a slit into the meaty portion of a raisin or prune or a piece of vegetable. Then place a very few crystals of strychnine (just what will rest on the very tip of a knife blade) in this slit and press the edges together. With a shovel open the main run or use prod if available and place one or two of the poisoned baits back from the opening and then close it. If the bait is simply dropped into an opening in the surface mound or the opening left unclosed the gopher sees the light and comes pushing a load of dirt ahead of him and nearly always throws the bait out unnoticed.

Trapping is also a desirable method of killing gophers but is slower and more expensive than poisoning. It is a good method for use where only an occasional gopher is seen or to follow up poisoning. For, irrespective of what methods are used, there will always be found a few individuals that can not be killed by the usual methods. There are different types of traps on the market, the Macabee being one of the most commonly used; the box trap and gopher gun are also successful in the hands of some operators. In all such work the skill of the operator is a big factor. In trapping as in poisoning the main run should be located with the aid of a shovel or a slender steel or hard wood probe. The surface mound is usually connected to the main run by a short lateral which may possibly never be used again while the regular burrow is used continuously. Some people set the trap in the lateral leading to the surface mound and by leaving the opening unclosed draw the gopher to the trap. But here also the plan may fail because the gopher may plug the hole farther back or clog the trap with dirt or throw it out on the surface.

After locating the main run clear out most of the loose dirt, set the trap lightly and if the Macabee trap or gopher gun is used, press them down firmly so that they are not easily thrown out of the way. When working in the main run two traps should be used, one facing each way. This makes the result much more certain than when only a single trap is used. The trap should be attached by a light wire or chain to a heavy chunk of wood or to a stake, the latter conspicuous enough so that it can be seen at a distance. If the traps are not anchored in some way they frequently will be found missing. Either they are sprung by the gopher and dragged off into the run, or a cat or dog finds the trap with a gopher in it and appropriates trap and all for its own use.

Carbon bisulphide is not as satisfactory on gophers as on ground squirrels. The gopher burrow is more extensive than that of the squirrels and also is more nearly level which prevents a heavy gas from penetrating it by gravity alone. The apparatus for generating the gas quickly and forcing it through the runs is especially valuable for gophers. In all cases the work should be done while the soil is wet enough to prevent the gas from escaping through cracks.

Flooding of orchards and alfalfa land is one of the quickest and most thorough methods of driving out gophers. With the aid of a good dog the irrigators can then take care of the gophers when they swim out on the level.

Farmers Grain Loading Stations and the Price of Barley

ANDREW KAISER, with his 100,000 bushel elevator, built near Hamilton City early in 1918, has demonstrated that a farmer can not only save large sums in the cost of sacks and extra labor by adopting bulk handling of grain in place of the old sack system, but can actually receive a higher price for his crop. He has done it for two seasons. In the very first one the savings effected and the higher price received were more than sufficient to pay the cost of the elevator and the other necessary charges.

The economy of bulk as opposed to sack handling has now been investigated and discussed by farmers, warehousemen and agricultural scientists until there is no further question of the advisability of the change. As long ago as June, 1916, Prof. B. H. Crocheron, superintendent of farm advisers, and C. J. Williams of the University of California published their Circular No. 152, "Some Observations on the Bulk Handling of Grain for California," reaching conclusions highly favorable to the modern method. Since that time the trend of events has been such as to make the need for the change more pronounced, and some of the circumstances cited as difficulties have disappeared.

The advantages everywhere admitted of bulk handling loading stations at the railroad sidings and metal grain bins on the farms are doing away with the cost of sacks (an item that has been extravagantly high in recent seasons and easily may become so again), the elimination of waste from the sacks as a result of rough handling, exposure to rain and sun and the gnawings of squirrels, rats and mice, a great reduction in the labor cost of handling, perfect protection of the grain from rain, fire and thieves, the retaining of the screenings with their considerable feeding value, and

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

There is a shortage of print paper. On this point our readers have been informed for several months, but during the last few weeks stories have come and gone as to shortage of pulp wood, extreme cold freezing the ponds where pulp wood is handled, and other circumstances which still further prevent manufacture and aggravate the shortage. And now publishers are anticipating an edict calling for great reduction in paper consumption. But regardless of any edict, conditions are so serious at the present that the publishers are watching every turn to reduce the tonnage. One step which the Cultivator is taking is shown on first cover page of this issue—instead of giving this space to an illustration this week it is used for editorial comment. We believe this particular comment, or statement of facts, is fully as interesting as the illustration. It is a wonderfully graphic presentation of California's importance as a food producing state.

Hereafter illustrations will not be taboo, for their worth is realized, and they will be used as much as possible, but more and more of the cover space will be given up to reading matter.

SOUND FINANCE

The supervisors of Imperial County, having nearly $2,000,000 of idle money, a portion of which it was impossible under the law to deposit in local banks, have proceeded to invest these funds in liberty bonds, or rather in certificates of indebtedness. This investment will net the county about $6,000 a month.

Not a bad turn for supervisors of other counties.

WHY NOT SUGAR FOR BEETS

A California beet grower who wished to secure full advantage of his year's work in the beet field asked the sugar factory to pay him in sugar at the price on which the factory based its returns to the grower; that is, the price paid for sugar at the factory door. If a nine cent price of sugar was used as a basis for figuring the grower's returns, why should not he be given his pay in nine cent sugar? But this suggestion was altogether too shocking to be considered for a minute by the manufacturer. He would not be so unjust as to ask the grower to take his pay in sugar; anyway, the sugar was all out of his hands and it was the "broker" who was sending up the price.

In other words, the grower of sugar beets is not competent to use his product for gambling purposes. Speculative values which are created after the sugar is "out of the manufacturer's hands" are for the benefit of the "friends of the manufacturer."

BE REASONABLE

The monthly financial review of the federal reserve bank of San Francisco says: "Prospects for excellent crops in 1920 have been materially improved by recent rains." Generally the remainder of this report is hopeful. However, regarding the transfers of real estate, there is a hint in the following. The Cultivator has no advice to give:

"Transfers of real estate are in large volume. There is a tendency throughout the district to purchase farm lands at high prices for the purpose of reselling at still higher prices. There is also a tendency on the part of many holders of small Liberty bonds to dispose of them to purchase preferred stocks of industrial corporations which offer higher rates of interest."

A MAN WHO KNOWS

The man who knows and knows he knows will be in good form for the next month. The census man will come with request for all kinds of information. On this information will depend much of the future. Unfortunately, he will often hear "I don't know." But the income tax man is different, and he will say "But you are supposed to know."

PACKERS CAPITULATE

Recent dispatches from Washington announced that the "big" meat packers had capitulated to the government and that they have agreed to divorce themselves from certain lines of business, including the ownership of stockyards.

Since the announcement, much speculation has been indulged in as to how the new order of things would affect the cost of living and the profits of the producer. Time alone will answer the many questions, but regardless of what effect the new situation will have, this much is certain: The capitulation of the packers establishes a far reaching principle in our national development. It means that no one group of men will be permitted to gain a monopoly upon essential food products. If nothing more has been accomplished, that great principle is worth much.

O SUGAR!

The time having passed in which the grower of beets could be benefited, there is a neat marking up of sugar prices. We now pay (this is some two or three days before going to press) $3 the 20 pounds. What has become of that 11 cent price which was fixed not so long ago by the government? We don't know. Will we ever see the old familiar

"20 Pounds One Dollar"?

Nevermore.

CLAIM THE BONDS

The Cultivator has repeatedly urged its readers to hold their purchases of Liberty and Victory bonds. Notwithstanding, it appears there is an enormous number of them offered for sale. It had hardly deemed it necessary to suggest that we all claim the bonds that are due to us, but now comes the director of the Pacific Coast war loan organization and says: "More than $41,000 worth of First Liberty Loan bonds, with accrued interest amounting to nearly $3,600, is going begging for rightful owners in the federal reserve bank of San Francisco."

These bonds have been lying in the bank for over two years. The bank suggests that if holders have lost their original certificates the bank should be notified and the holder will be aided in securing proof which will secure to him his property.

FARMERS NOT STRIKERS

The ill advised effort to bring farmers and the Federation of Labor together appears to be succeeding little better than the effort to bring policemen and firemen under the domination of the walking delegate. The farmer has often had occasion to feel that he was discriminated against, but he does not propose to commit unlawful acts to correct the discrimination. He is, however, learning the power of cooperation and is conducting his business operations in a business like way.

Commenting on this matter of affiliation, a writer in the Dairy Farmer said:

"I fully agree that the farmers have many common interests with the toilers of the cities. But events of the last year, and particularly of the last few weeks, have in my opinion alienated much of the good will toward organized labor that was previously in the hearts of the farmers. For this condition you may not be responsible, nor sane and conservative members of the A. F. of L.

At this moment your team is running away. We as farmers would be glad to aid in stopping them, but not to ride in the wagon. We do want the right to collectively sell our farm products and the right to buy our necessities collectively—but we do not ask the right to impose our collective agent upon any purchaser, nor the right to tell any purchaser that if he does not want our collected products at the price we name, that he must arbitrate or that he must not supply his wants from any other source if he would avoid trouble.

"We do not through legal enactment, nor in the court of public sentiment, ask any such un-American advantage. There are some radical differences, I fear, and with roots reaching down too deep for affiliation at this time. 'Law and order' are words not yet erased from the vocabulary of the farmer and cannot be with ease. He believes in the open shop. He is not opposed to labor unions. He may be divided in sentiment upon the right to quit work, to strike, and under what circumstances. But the right to contract between men is to him a sacred one. Farmers do want some relief, but they will only ask such relief through channels provided by the constitution and laws of the country."

The farmer does not believe in class organization, neither does he wish to be lined up with any people who claim rights because of belonging to a class; his cooperative marketing operations are organized purely to secure competent handling of his products in the markets. The laborer is entitled to organize and dispose of his products in the same way, but unfortunately organized labor has not in the past taken this view.

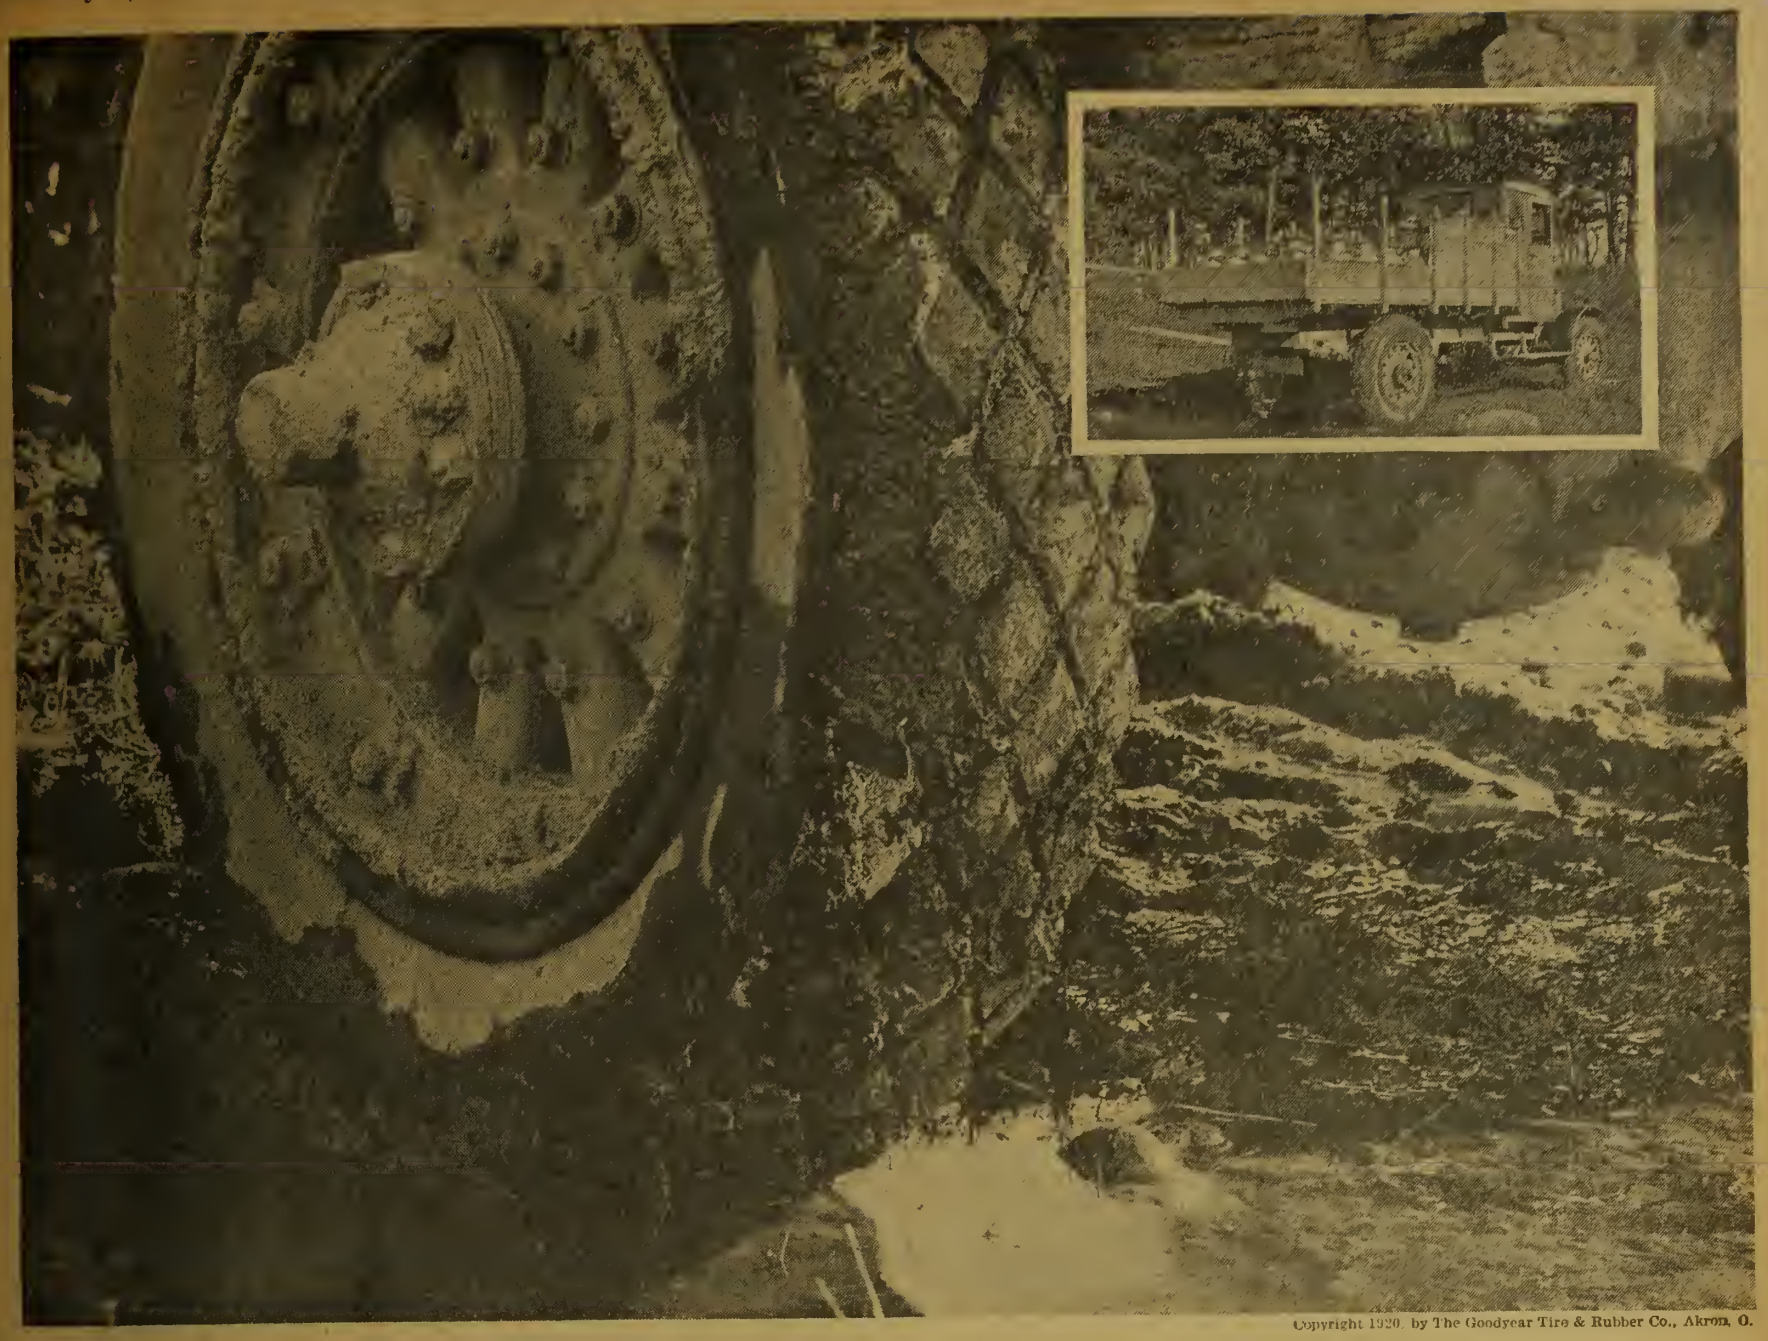
AARON AARONSOHN

Attendants at the state fruit growers convention held at Fresno in 1913 will recall one speaker who had come from Palestine to learn in the newest of agricultural sections what would give inspiration to one of the oldest agricultural sections of the world. Aaron Aaronsohn was engaged in reestablishing Jewish people in the Holy Land. One of the steps taken to advance this purpose, and which was being financed by wealthy Hebrews in America, was the building of an experiment station at Haifa. For that station he wanted the latest in agricultural information and the best in seeds and plants which might be used to restore to agriculture the barren hillsides of Mount Lebanon and the plains about the Sea of Gallilee. At that time Mr. Aaronsohn made comparison between conditions in the Holy Land and those in California. From that address we will quote in next week's Cultivator.

During the war Mr. Aaronsohn's family and all his helpers were massacred by the Turks. He escaped and at the close of the war was laying plans for continuing his work of encouraging the Hebrew people to return to the Holy Land. Having occasion to go from London to Paris, he took passage in an airship which is supposed to have been lost in the fog in the channel.

In a tribute to Mr. Aaronsohn and another explorer and seeker for plants, Frank N. Meyer, in the Journal of Heredity and reprinted in the Monthly Bulletin of the California department of agriculture, David Fairchild of the United States department writes:

"That, just as the war clouds are lifting and he was making plans to put in new crop plants and start a new agriculture on a quarter of a million acres of land in Palestine, and was hurrying through the air from London to Paris, he and his pilot should instantly drop through the fog into the sea and be lost, seems too hard to believe, for we had come to feel that there on the eastern, Oriental end of the Mediterranean there was coming into existence a type of experimental agriculture which would be epoch making and that Aaronsohn was the man destined to bring this about. When the war broke, a beginning in plant exchange had been made, and the plant breeders of America will find in Aaronsohn's bulletin on his agricultural explorations in Palestine a large number of valuable suggestions regarding the possibilities of new dry-land cereals, stocks for jujubes, oil producing grains, the carob fodder tree, and cover crops for citrus orchards. The date growers in the Salt River Valley have grown some of the date palms which Aaronsohn got for them in Egypt, and the desert hawthorn which he sent in is being tested as a stock for early pears."



Copyright 1920, by The Goodyear Tire & Rubber Co., Akron, O.

"MY Goodyear Cords have paid for themselves in ten months with all-round savings of time, labor, repairs, etc. I figure the reduction in gasoline alone will pay the cost of these tires over solids. They have traveled nearly 10,000 miles to date and are good for another year at least."—Herman Marks, Farmer and Rural Expressman, R. F. D. 6, Waukesha, Wisconsin

THE advantages of hauling on pneumatics, as demonstrated by this dairy farmer and motor expressman, are proving of extreme importance to many farmers otherwise hampered by the scarcity of labor.

With motor trucks relieved of the handicaps of solid tires, they now haul across soft fields and through deep mud and snow on the tractive pneumatics.

The cushioning of these tires is a source of valuable protection to perishable produce and prime livestock which must be marketed quickly and smoothly to secure top prices.

Both of these qualities of the pneumatics have a firm foundation in Goodyear Cord construction, pioneered by Goodyear years ago and today the basis of the country-wide success of cord pneumatic truck tires.

It is this Goodyear Cord construction which has made pneumatics practical for farm truck service, and thus has enabled farmers to motorize most effectively by using pneumatic-tired trucks to keep their power-driven farm machinery working at capacity.

Authentic information, describing how farmers employ pneumatic-tired trucks and what they save as a result, can be obtained by writing to The Goodyear Tire & Rubber Company, at Akron, Ohio.

The FARMER says=

"for stumping genuine GIANT has no equal"

From recent letters of ten farmers who have used Giant Powders for Stumping we make these extracts:

"1. Your Giant Farm Powders shoot the roots. 2. They have wide breaking power and less bad gases than others. 3. I get the same excellent results from them every time. 4. They are always uniform. 5. I used eleven tons and wouldn't have any other make. 6. I want to sell a lot of other powder that I have because Giant does the work much better. 7. Genuine Giant can't be equalled. 8. I don't have to use so much powder when I blast with Giant. 9. You know what we need for stumping. 10. I save money by using Giant Powders."

Write today for our free book, "Better Farming With Giant Farm Powders." It tells how to save money and get better results in stumping, ditching, tree-planting, etc.

"One raw fur house which can be relied upon"

When you ship your raw furs to H. Liebes & Co. you will get the same fair and square treatment that Ulysses Bonetti of California does. Read what he says about the way H. Liebes & Co. treat trappers—

"I am sending you another lot of furs and will send you all I trap because I have found that H. Liebes & Co. is one raw fur house which can be relied upon to do the right thing."

Trappers who want honest grading, fair prices with no commission charges, should send their furs to H. Liebes & Co.—the largest manufacturing furriers in the West. Write for our price list today.

H. Liebes & Co. pay express or parcels post and send you your money the day your furs are received. Remember if you're not satisfied, return our check and we'll send your furs back, prepaid. Isn't that fair?

What Rootstocks Are We Using?

By W. L. Howard

THE rootstock problem is an old one but ever new to the fruit growers and nurserymen of California. Experience has taught that certain fruits may be adapted to adverse soil conditions by using the right kind of rootstock. While there is much that we do not know about rootstocks, we do have sufficient information on the subject to make it worth while to review the present status as regards the general or special use of the well known stocks we are using every year we continue to plant orchards.

Three years ago I made a survey of the nurseries of the state to find out just what stocks were then being used, assuming that the nurserymen were giving the people what they wanted. In other words, it seemed to be a safe assumption that the percentage of the different rootstocks being used by the nurserymen was a correct index of the extent to which such stocks were being planted. The interest in the results of this survey was so widespread that I have again canvassed the nurserymen in order to bring my figures up to date.

The results secured three years ago were as follows:

Stocks for almonds: Peach, 44 per cent; almond, 56.

For apricots: Apricot, 58 per cent; peach, 28; myrobalan, 13; almond, 1.

For cherries: Mazzard, 71 per cent; mahaleb, 26; miscellaneous, 3.

For peaches: Peach, 90 per cent; almond, apricot and myrobalan, 10.

For pears: Japanese, 63 per cent; French, 33; quince, 4.

For plums: Myrobalan, 60 per cent; peach, 37; almond, 3.

For prunes: Myrobalan, 64 per cent; peach, 24; almond, 11; apricot, 1.

For walnuts: Northern California black, 99 per cent; miscellaneous, 1.

The survey just completed, which of course includes the trees planted during the present season, shows results to be quite different in some particulars from what they were three years ago. At present a much larger percentage of almond root is being used as stock for almonds, and much less peach root for the same purpose.

The results for apricots show that apricot root is much less popular as a stock than formerly, that peach is about the same, and that myrobalan is used to a much greater extent than three years ago.

In the main, the results for cherries are about as they were, although about seven per cent more mazzard is being used than was previously reported, with a consequent decrease in the amount of mahaleb.

We are now using a much greater percentage of peach root as a stock for peaches than we were. Three years ago, almond, apricot and myrobalan made up ten per cent, whereas myrobalan was not reported at all as a stock for peaches during my recent survey.

The percentage of Japanese stock for pears has jumped from 63 to 76 per cent, and the French stock has decreased from 33 to 20 per cent.

The results for plums and prunes have not changed materially, except that we are now using more apricot as rootstock for plums and almond for prunes than we were.

By classifying the nurseries by regions some additional information is brought out regarding the preference for certain stocks in certain places. While we know, of course, that any given nursery doing a large business sells stock all over the state, it is assumed that it will be influenced by the desires of growers who may live near by under their particular set of climatic and soil conditions.

Three regions have been recognized, namely, the foothills, interior valleys and coastal valleys. It is interesting to compare or contrast the reports of rootstocks used by the nurseries in these different regions with the average for the whole state. It is also interesting to compare them with one another.

In the case of almonds, there are no great regional differences in the use of stocks, almond, the preferred root, being about the same in all districts. Apricot is a much more popular rootstock for apricot trees in the interior valleys than it is in either the foothills or the coastal region. Likewise, the peach is used much more as a stock in the same region than it is in either of the others. One striking feature is that myrobalan is so popular as a stock for apricots in the foothills and coastal valleys, while only a small percentage is used in the interior. Another interesting feature brought out is that mahaleb rootstock is so popular in the interior valleys and so unpopular in the foothills. Peach is a very popular stock for plums and prunes in the interior valleys and foothills but is not favored by the coastal valley nurseries. Almond is a very popular stock for prunes in the coastal region, but is used only in a small way in the foothills and interior valleys. Finally, a very large percentage of apricot is being used for stock for prunes in the interior valleys, while none is used in the foothills and less than two per cent in the coastal region.

Complete figures are presented below, and it is hoped that those who are interested will study them carefully. It might be added that for the first time one coastal valley nursery reports the use of a considerable percentage of Kieffer pear root as a stock for pears. The Kieffer, because the seeds can be procured from canneries, is often used in the East, especially when imported stock is scarce, but this is the first time I have met with this stock in California. There is no reason why Kieffer should not make a reasonably good stock, as it is probably more resistant to blight than French stock, although it is not as safe as the Japanese root.

Apparently the increased use of apricot as a stock for prunes is based on the belief that the apricot is more tolerant of a slightly alkaline soil than any of the other available stocks; at least this is the reason given for its use. In this case I should like to again call attention to the advisability of making larger use of Prunus davidiana as a rootstock for peaches, and perhaps for plums and prunes also where the soil is too alkaline for other stocks to thrive. I recently had an opportunity to visit an orchard near Yuba City, growing on davidiana stock and just now about four years old. Previous plantings of peaches on peach stock speedily died on account of the alkali.

ROOTSTOCKS USED FOR DECIDUOUS FRUITS IN CALIFORNIA, 1919

Fruit	Rootstock	Average Per Cent State	Average Per Cent Foothills	Average Per Cent Interior Valleys	Average Per Cent Coastal Valleys

Orange County Citrus Institute

By Ernest Braunton

UNDER the auspices of the Orange County farm bureau a four day citrus institute was held at Fullerton, the evening sessions at the high school and the afternoon lectures and demonstrations at the ranch of S. W. McColloch, three miles northeast of Fullerton. One of the most instructive of the latter was given by Drs Barrett and Fawcett of the Riverside citrus experiment station, on diseases of citrus trees.

Dr. J. T. Barrett, at present acting director of the station, spoke on root diseases of citrus trees substantially as follows:

"We have gone astray in the treatment of citrus troubles in the past through lack of root investigations, and the two diseases I shall speak of have much the same effect upon the tree above as gopher injury to the roots. The first is best known as the oak tree root fungus, Armillaria mellea, really a toadstool, the mycelium or thread-like plant of which penetrates the tissue of the roots. As it travels underground its presence is unsuspected and with oak trees nothing is known of it in many cases until they suddenly die. It attacks eucalypts, peppers, sycamores, deciduous and evergreen fruit trees and many ornamental trees and shrubs.

"So far does it travel for victims that we have traced it from a sycamore across under a street and into an adjoining orchard. So persistent is it that eight years after removal of an oak, citrus trees were planted and some died in two years. As the mycelium has been traced six feet down into the soil it will be seen that it is hard to combat. The only surface manifestation will be clusters of large brown toadstools near the base of trees. It is not thought any new infections come through the spores, though these will quickly propagate in manure. The disease in most cases may be traced to native trees or shrubs. In one case a diseased sycamore was removed and navels planted and in four years some had died. Prof. Horne is controlling some trees in an area formerly affected by trenching around it and each year opening this trench to look for roots that may have entered. In removing diseased trees it is necessary to remove all the roots possible for they hold the armillaria in the soil for years. In 1914 one man built a concrete wall deep down in the soil, 400 feet long, to keep out this dreaded mycelium. The top of the wall is one foot below the surface to allow of cultivation. Every year the soil on top of the wall is dug up to look for menacing roots. This disease also attacks walnuts and they readily succumb. In fact, the citrus trees are the most resistant of any.

Dry Root Rot

"The dry root disease or rot is not a gum disease, and though the bark rots and will slough off, it later becomes dry if not forcibly removed. The affected part is at the crown just under the soil and does not extend far down, a distinctly crown disease. This is fusarium, of which there are several species often associated in one attack. It reaches clear through the wood to the very center, and very little can be done to stop its ravages. A sudden stoppage of water flow into the tree seems to be the immediate cause of death. In gum diseases the tree will recover, but this one is at present well nigh hopeless. We hope to learn something that may aid you and it may be that a close search may reveal the trouble in time to help. We have cut away roots and parts of trunk and still lost out. Do not despair, however, for while badly affected trees may as well be destroyed, where one root is affected it may be cut off or even a part of the trunk painted with asphalt and may be saved. The best disinfectant with which to treat the affected parts is corrosive sublimate in 50 per cent alcohol, or mercuric cyanide is good. The solution should be one to 500 of the alcohol. Allow it to dry thoroughly and then apply asphalt. In digging holes for young trees in affected areas do not replace the same soil in the holes; get it elsewhere. There is no evidence that this disease travels from one tree to another."

Gummosis

Dr. H. S. Fawcett in his opening remarks said: "Dr. Barrett has been telling you of two citrus troubles below the soil, and I will tell you something of two occurring above the soil. The first is gummosis, of which we know both cause and control, but of the second, or scaly bark, we know but little.

"Gummosis first appears as gum exuding from the bark at the surface of the soil though some bark has generally been killed before discovery and the amount of gum in evidence is no guage of damage but is dependent for supply upon season. Most infections come in the rainy season or after improper irrigation, but the trouble will not be apparent for two or three months. The bark will be killed through to the wood, due to a fungus which causes brown rot in the fruits of the lemon tree. Lemons hanging near the ground in infected soil areas will become infected by rain drops rebounding and touching the fruit. The mycelium is microscopic and grows into the bark, but if the bark be dry it will not be affected, so it is an easy disease to prevent.

"Lemon trees are more susceptible than oranges and sour orange is practically immune. To prevent infection it is only necessary to keep the soil away from the trunk down to the top of the main roots. This may expose the roots somewhat and make a little depression about the trunk, from which irrigating water should be kept, but no harm will result from exposure. The ounce of prevention is to bud high on sour orange stock. In light soils merely keep the crown clear, but in heavy soils it is well to paint the parts with Bordeaux paste or spray with a heavy Bordeaux mixture. In infected cases it is best to cut away affected parts and an inch or so of the good bark around the dead parts. Then treat with carbolineum, creolin, Bordeaux paste, and there are other materials equally good. If trees are completely girdled there remains nothing but bridge grafting or inarching, else will the trees die within nine months or a year. In one case of a 20 year old Valencia orange completely girdled I planted young seedlings around the trunk, grafted them in and the recovery of the tree was rapid.

Scaly Bark

"Scaly bark is a disease exclusively of the orange, not known on the lemon or even on the sour orange, and the Valencia is most susceptible. We cannot tell so much about this disease, its cause or prevention, as in the case of the gum disease. It starts through slight eruptions of the bark and scales

The Cultivator costs only one dollar yearly

Lowest Cost per Working Hour

Price, in the purchase of a tractor, should be a secondary consideration. Of chief importance are the tractor's dependability, its ability to do all sorts of work, under all sorts of conditions, with a low operating and upkeep expense.

Many years of "Caterpillar" Tractor operation have proved its cost lowest, not only per actual working hour, but also per acre worked. Statistics from hundreds of "Caterpillar" Tractor owners prove this to be so.

Power to pull an unusual number of plows at an unusual depth, versatility in operation, construction that minimize delays and expense for repairs, make "Caterpillar" Tractor costs lowest and its profits largest.

"Caterpillar" superiority is the combined result of Holt selection and combination of materials, Holt workmanship and particularly of Holt design—developments resulting from more than a quarter century of tractor study and experience.

"Caterpillar" Tractor capacity has been proved scores of times for thousands of farmers everywhere. The War service of the "Caterpillar" Tractor proved it for the entire world. The "Caterpillar" Tractor was the only tractor used by the Allies for their heaviest war service, selected after severe and prolonged tests.

The "Caterpillar" Tractor stands today without an equal for efficiency or economy. The records it has established in every class of work, in every part of the world, under every sort of condition, prove its superiority. What the "Caterpillar" Tractor has done for others in reducing costs and increasing profits, it can do for you.

The Service You Want in a Tractor You Get in a Waterloo Boy

The measure of value of any farm machine you buy is the amount of service derived after its purchase. To be the right kind of investment any machine must "make good" in your hands.

You want a tractor that will do the work you have to do and that will make you money while doing it. A Waterloo Boy meets your tractor requirements. Its purchase means real tractor satisfaction.

WATERLOO BOY
BURNS KEROSENE COMPLETELY

A Waterloo Boy combines economy with efficiency. It gives you dependable service at small operating cost. Its twin-cylinder engine develops full 12 h. p. at the drawbar and 25 h. p. on the belt, using kerosene as a fuel. The patented manifold converts every drop of this low-priced fuel into reliable power. Two gallons of kerosene per acre is the average amount used when plowing.

A Fan, Pump and Radiator cooling system hold the engine at the proper temperature to give you the greatest service. While the motor runs at the right temperature for perfect lubrication, enough heat is maintained to insure complete combustion and full power from the fuel. The radiator holds 13 gallons of water. You don't have to stop in the field every few hours and fill it. That means time saved.

A Drawbar Shift Lever eliminates side draft on both tractor and tools. By shifting this lever the center line of pull of the tractor always corresponds with the center line of draft on the plow.

The Pulley Wheel on the Waterloo Boy is mounted on an extension of the engine crankshaft. It is carried on wide, heavy-duty Hyatt bearings. There are no gears in mesh to cause friction. All power goes directly to the belt.

The Waterloo Boy is especially strong and rugged in its construction. Its various parts are designed to meet every possible strain. It stands up under the most severe conditions. Every part is easy to get at. The engine runs without vibration. Its well-balanced weight provides proper traction in soft ground. It is built for, and gives you, real service.

JOHN DEERE MOLINE, ILL.

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

of a half inch diameter peeling off. There is no gum at beginning but in six or 12 months gum will be found if diseased bark is cut or a few drops may ooze out. It may take six months or a year to affect a spot three inches square, and injury is not often noticed until one to three years has elapsed. We will speak of the disease in three stages or degrees of injury.

"The first stage may be said to occur one-fourth way around the trunk, and the treatment is to cut out the bark to solid wood and disinfect. But if the infected part is half or two-thirds the way round, or the second stage, it is suicide to cut it out. The better way is to scrape the bark, more especially around the edges, for in spite of the infection new bark will try to grow over the edges and should be aided in the effort. Do not neglect treatment, even if advance of disease is very slow, and keep at it. You may win. Preventive measures would be to treat the trunks two to five years before visible damage. Painting with all sorts of 'dope' has been tried to cure the affected parts but without avail, and in that line we have nothing to offer. In the last, or third, stage if the wood is cut into a strong bad odor will be noted. We do not know how nature spreads or transmits the disease, but trees may be inoculated with it."

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Soy Beans

What time of the year should I plant soy beans in the San Joaquin Valley? How should I plant them? Do they need much irrigation and cultivation? —A. J. S., Oakdale.

While soy beans are quite hardy it is better not to plant until danger of frost is past, April or the first of May. Rows are usually three and a half feet apart and plants are left from six to ten inches apart in the row. They do best on a light but rich soil. They should be covered about an inch deep, on slightly raised ridges if possible, if there is danger of heavy rains before beans are up, a condition seldom present in California. If on damp land irrigation will not be necessary. On the average soil one irrigation should do if applied at the right time. Watch the plants and if leaves commence to shrivel (not merely wilt) water at once and this should be sufficient to carry the crop through.

Blackeyes for Hog Feed

In your issue of November 22, Question and Answer page, I notice an inquiry from Subscriber, Fullerton, in re Blackeye beans for hog feed, and thought my experience might be helpful.

For several years I have been feeding Blackeyes in a mixture with other feeds to my brood sows and hogs that I grow out for brood stock. For two years I have planted Gyp corn or milo and planted Blackeye beans in the same row, letting the two crops grow together and when ripe hog them down. I have been highly pleased with this method, both with growing pigs and brood sows and gilts in breeding season. As regarding the value of beans for pork, I note Prof. Woll says they will produce soft pork. At the farm bureau auction sale of fat hogs at Modesto last May we had several lots of hogs fattened on beans. Some were fed on whole uncooked Blackeyes, some on other varieties cooked and some on cooked beans and stock molasses. We marked the different lots and had them killed separately and all killed out hard. A neighbor bought up a lot of cheap beans last spring and bought hogs and fed them the beans exclusively and had good hogs that made splendid gains with no other feeds. The Blackeye is the only bean that is palatable to the hog raw. All kinds of stock and poultry relishes the Blackeye. All other beans must be cooked to get the best results.—Elmer Lamb, Ceres.

Lemons Need Care

What treatment should be given to a lemon tree that has been neglected and allowed to dry out until the foliage is thin and yellow in color? It is a well shaped tree and is six feet high. —Subscriber, Santa Cruz.

The first step should be thorough tilth of soil, incorporating well rotted stable manure or any vegetable matter. Give it sufficient moisture. It might be well at first to give slight dressing of a complete fertilizer or nitrate of soda so as to give immediate start to the tree as soon as the warm weather comes.

Boys Stealing Honey

Some parties robbed my bee hives and in doing so destroyed many bees and did material damage. What relief have I?—Subscriber.

In case this is a bunch of live wire, high pressure American youngsters would suggest that you see their parents and ask the damage be made good. If they do not think best to do so then it would be a case for the courts. Boys will be boys but destroying property should be discouraged.

GRAIN LOADING STATIONS

Continued rfom Page 5.

the freedom acquired by the farmer to hold his grain for a favorable market and a time when his teams and trucks are not overdriven and cars are available.

That, in addition to all this, the farmer may secure a higher price for his crop by having all the processes of cleaning, storing and loading under his own control or that of an association of which he is a member, has not hitherto been realized. It may not be possible to secure a higher grading of wheat in this way but the amount of dockage for screenings and waste has always been a debatable matter, with a natural tendency on the part of the wholesalers to allow themselves a generous margin for safety. In other words, they always give themselves the benefit of the doubt. When the farmer cleans his own grain he does away with this and gets just what his product is worth in the market.

With barley the advantage to the farmer of his own loading station is much greater. Barley is usually bought by the lot, at a price agreed upon, which price is based largely upon the appearance of the grain, its content of chaff, waste, etc. With an elevator equipped like Mr. Kaiser's with both bearder and separator, the chaff, which is very light and very bulky and extremely damaging to the appearance of the grain, is removed at a trifling cost. Then the barley can be sold on its real merits. This difference has amounted to something over ten cents a hundred on Mr. Kaiser's most recent crop.

The Athlone elevator, with a capacity of 800 tons, was built three years ago by Cunningham and Hayes. They put through it in the first season about 1,500 tons and saved enough over the sack handling system to more than cover their entire expenditure for the elevator and the changes in harvesting equipment.

These changes in equipment have been a bugaboo to many farmers when they have discussed the change to the modern methods. The fact is that they are neither difficult nor expensive. Bulk handling attachments for the combined harvester, from which the grain is spouted into the wagons, can readily be applied, either locally or by the manufacturers. In Oklahoma and other portions of the Central West where the combined harvester is used they have been common for years. Grain tight wagon bodies for holding up to three tons are not very costly. When used as trailers with a truck or tractor they will get the grain from the fields or the farmers' metal bins to the loading station in quick time and with the least possible labor.

California farmers are fast concluding that the time has come to bring their grain handling methods in line with those of all other progressive sections. They are deciding that it is not necessary to scatter ten per cent of their crop about the fields, roads and warehouses, to feed the squirrels and the rats and mice, and to accept a lower rating on the remainder than that to which it is entitled in the market.—J. S.

TOP DRESSING TALKS, No. 5

Use Nitrogen to Insure Lasting Fertility

"With the nitrogen question is indissolubly linked the organic matter question. It is therefore urged with all the force which we can command that the producer of crops in California recognize first and foremost that his problem in the maintenance of fertility in California soils lies chiefly in supplying his soils with, and maintaining therein, as large a supply of nitrogen as he can with financial profit or even without loss."

From California Circular No. 170, by Dr. C. B. Lipman

ARCADIAN

Sulphate of Ammonia

Arcadian Sulphate of Ammonia contains one-third more nitrogen than any other top-dressing material. It is all soluble and quickly available, and is the form best suited to California soils.

You can greatly increase the profits of your orchards and field crops if you top-dress with Arcadian Sulphate of Ammonia—100 to 300 pounds per acre, depending upon crop and soil. Write us for full information.

PLANT Fruit Trees

We Specialize in Fruit Bearing Trees

We grow our trees in the choicest spot in California—Fresno. Here in Central California the most favorable climatic, soil and water conditions prevail, making possible the production of superior trees and vines. Added to this is our intimate knowledge of the business which enables us to exercise the most intelligent care in growing and handling nursery stock.

You should have our catalogue. Our descriptions of varieties are more complete and comprehensive than in any other book. It tells you what you ought to know in order to select trees intelligently. Sent free on request.

Bigger crops mean more money

Proper and frequent cultivation are necessary to the production of maximum crops. Planet Jr. tools enable you to get increased yields because of their superior design, scientific construction. They do the work quicker, easier and more thoroughly. Planet Jrs. are guaranteed fully and last a lifetime.

No. 4 Planet Jr. Combined Hill and Drill Seeder, Wheel-Hoe, Cultivator and Plow sows all garden seeds (in hills or drills), plows, opens furrows and covers them, hoes and cultivates them all through the season. A hand machine that does the work so thoroughly, quickly and easily that it pays for itself in a single season.

No. 12 Planet Jr. Double and Single Wheel-Hoe has hoes that are wonderful weed killers. The plows open furrows, cover them and hill the growing crops. The cultivator teeth work deep or shallow. The leaf lifters save much time in late work when plants are large or leaves too low for ordinary work. Crops are straddled till 20 inches high, then the tool works between rows.

No. 4

Planet Jr.

Free 72-page Catalog Shows tools doing actual farm and garden work and describes over 55 Planet Jrs. including Seeders, Wheel-Hoes, Horse-Hoes, Harrows, Orchard, Beet and Pivot-Wheel Riding Cultivators. *Write for it today.*

This Month in the Vegetable Garden

Southern California

By D. F. Reichard

How about the vegetable supply for this year? Now is the time to think and prepare for it. Plan the garden, draw a diagram of your garden to be and get the full pleasure and benefit of your garden work by spending a few evenings with the family planning and deciding how and what you are going to have. By way of assisting we would suggest that you select a piece of ground that is naturally rich, well watered and of a nature that drains nicely. Land with a southern exposure is to be preferred, but we cannot all have that. At any rate select land that has enough slope to irrigate well. The size should be considered, also, whether it is to be just a garden for this season or a permanent one. If it is to be an annual or seasonal garden it is only necessary to arrange space for such plants as tomatoes, peppers and egg plant; the rest can all be made up by planting seeds. With a permanent or perennial garden it will be more difficult to plan.

Now that the size and nature of the vegetable plot is decided get paper and pencil and make a list of what stuff you will grow; then draw a plan of the garden arranging plants in rows. You will want an asparagus bed, artichokes and different kinds of berries as well as the annuals. The perennials such as asparagus, rhubarb and berries should be planted at the side of the plot so as to give them special care as to fertilization, irrigation and cultivation without interfering with the care of the annual crops. It is preferable to have the bush berries arranged at the outer edge of the garden with the out growing ones outermost. Plant first the Rampant Himalaya, the upright growing standard black or the Mammoth blackberries; then logans, dew, phenomenal and raspberries. On the other side of the plot, or next to the berries, may be planted rhubarb and globe artichokes, the asparagus and herbs, including a plant or two each of sage, thyme, marjoram, savory, tarragon, parsley, chives, mint and horse radish. Then for the strawberries, if the family cares for them at all, 75 or 100 plants should be set out. Of the other plants, for a family of four or five, there should be set out six to 12 of the blackberry and loganberry types while there should be 18 to 24 raspberries, a half dozen each of rhubarb and artichokes and 50 to 100 asparagus. Chart such of these as you want on your plan, allowing the larger berry plants rows six feet apart, raspberries four to five feet, rhubarb, artichokes and asparagus, four feet, and strawberries two to three feet. All of these things should be set out as soon as possible so as to get them established before the growing season comes.

Next allow space for the plants of tomatoes, peppers and egg plants. Although these will not be planted for some time the space should be arranged. It may be used for a quick maturing crop like lettuce, spinach or radishes or as a seed bed for cabbage, etc., before the plants are set. February or March is plenty early for setting out these plants.

If your garden has to be a small one it is not advisable to plant potatoes because they require considerable space to produce enough to make them worth while, but most of us like potatoes and feel we should put in some anyway. In favorable situations potatoes may be planted most any time after the middle of January. An average yield amounts to about 12 times the weight of the seed planted. Plant potatoes, dropping one good piece every foot in rows about two feet apart, covering the seed three to four inches. In order of their earliness plant Bliss Triumph, Red Rose, White Rose, American Wonder, British Queen.

Plant a row or two of peas; Senators or Stratagem are the best, sowing at the rate of a pound to 150 feet, giving each row about two feet and covering the seed two or three inches, according to the nature of the ground; sow deeper in the lighter soils.

Plant carrots and parsnips. Be sure to have your ground deeply worked and pulverized so that their roots can properly develop. With these in the same drill may be strewn a few radish seed. These will come up quickly and break the surface for the more delicate carrot and parsnip plants. The radishes will be ready to use by the time the others are to be thinned out. Also plant turnips and beets. These will come up readily. An ounce of each of these will sow a row 100 to 150 feet long.

Put in some onion seed for dry onions, using Australian Brown for storing for next winter, White Globe for fall use and Crystal Wax or White Queen for early summer use and for pickling. An ounce of any one of these will plant a row 125 feet long and should produce about 75 pounds of ripe onions.

Set out plants of cabbage 15 to 20 inches apart in rows two to three feet apart. Cauliflower plants should be set about two feet apart in rows at least three feet apart and tall kale the same. Plant all of these in the bottom of a furrow at least six inches deep and gradually work the dirt in around them as they grow.

In the frostless spots Canadian Wonder and Ventura Wonder Wax beans may be planted, but for the most of us it is advisable to wait until next month to plant beans; the same may be said of sweet corn, melons and cucumbers. So, in planning the garden it is well to reserve some space for the appetizing crops that cannot be planted for a month or two.

For those with trees and bush berries already established this is the ideal month to prune and spray, giving them all a thorough cleaning. Cultivate among any growing crops and thoroughly work up all idle ground so that it will be in good condition when it is time to plant.

Northern California

By A. R. Gould

First and foremost the writer wishes to convey to all readers of these monthly notes his best wishes for the new year and hopes that it will be a year full of results. We shall endeavor to make this column even more helpful than before and where more details are needed be sure to write us care of the editor.

The raising of fresh vegetables is a healthful feature as it provides exercise and good food for the body which is essential to good living. It may be indulged in by all providing the land is available, and in this great country of ours there is enough for all and it does not take a thousand acre tract to supply the family with vegetables. Half an acre and less, properly cropped, will do it. There is nothing more interesting than to cultivate the soil, plant seeds and watch the returns from nature's storeroom. Of course it means a little hard exercise and close attention to keep up a succession but the results are well worth it. Those who cultivate their home garden plot are doing their share towards the work of crop production and supplying the world's need. Let one and all resolve to start in right now the first month of the year. Get a hoe, rake, digging fork, spade, shovel, pickaxe, grubaxe, trowel, garden line, wheelbarrow and one man wheel cultivator, and for the bugs insecticide and a pump sprayer. Some of the catalogs are now ready and you should select your seed from a reliable seed house. Cheap seed is to be avoided; it causes nothing but trouble and loss of time. Get it from those who know the business. After the recent rains the ground should be somewhat easier to trench. Soil which has

become impoverished by continual cropping needs plant food and plenty of it and we would advise that farmyard manure be trenched in one to two feet deep, but where poultry or pig manure is used remember that a little of this will go a long way. It has a powerful effect. Artificial fertilizers are helpful such as bone meal, dried blood, sulphate of ammonia, etc., and wood ashes, lime and soot are also of great value worked lightly in the surface of the soil.

Lettuce

Sow on a warm border and afterwards transplant Los Angeles and Big Boston varieties. In the meantime prepare the plots for planting out by deep trenching with liberal applications of manure.

Kale and Cabbage

Where plants are obtainable it is advisable to plant these out in rows 18 to 20 inches apart and the rains will help them to become well established and provide green vegetables for late spring use.

Peas

Main crop peas should be now making good progress and early varieties will be coming into flower towards the end of the month. Keep the rows well cultivated. Sow for succession in rows 24 to 30 inches apart: Little Marvel, Stratagem, Blue Bantam and American Wonder. This last named is a heavy cropper.

Onions

This month main crop varieties may be sown and for this purpose we recommend Prizetaker, Australian Brown or Yellow Flat Danvers, all good keeping and desirable varieties. Have the ground well manured and the surface raked fine before the seed is sown and never try to work the soil when too moist. Apply soot or wood ashes where farmyard manure is not obtainable. Sow the seed very thinly in rows 18 to 20 inches apart and cover one-half inch deep. It will now be necessary to thin out the earlier varieties sown last month and the young plants may be left four inches apart in the rows. At the same time you may transplant those taken out to other well prepared plots.

Carrots

Sow in rows 18 inches apart in soil of a deep sandy loam richly manured such varieties as Early Shorthorn and Danvers Half-long.

Turnips

Sow Early Snowball and White Egg in rows 18 to 20 inches apart. They repay for a liberal dressing of manure some weeks before sowing.

Herbs

You should secure plants of the following: Mint, thyme, sage and sweet marjoram. They may be planted along the border of paths or in a special plot.

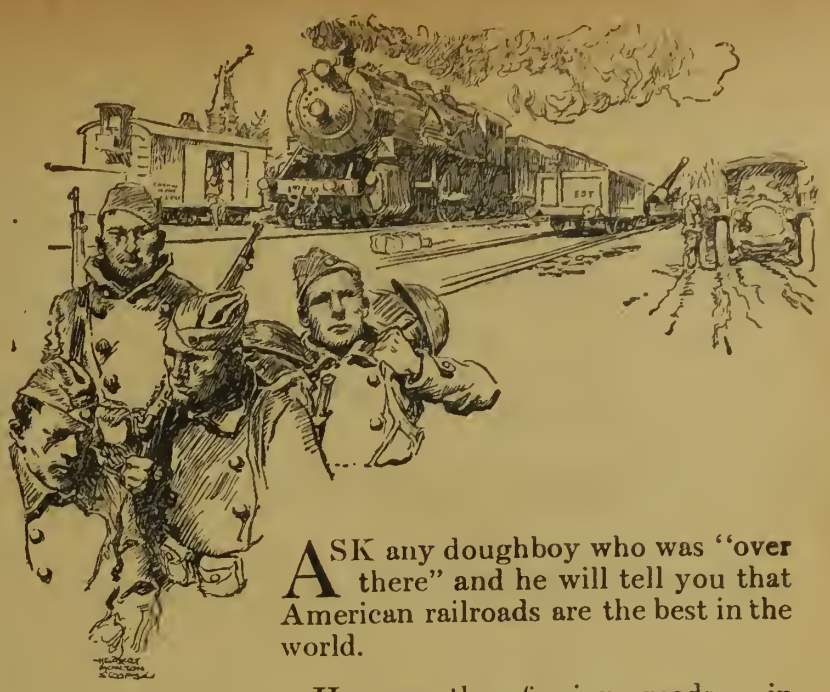
Strawberries

Clean through all existing plots and remove any young plants from between the rows, using these to plant other plots. Apply a good manure dressing to the older plots and cultivate between the rows. If you intend starting a new strawberry plot secure plants true to name of such varieties as Oregon Improved Everbearing, Gold Dollar and Malinda.

POTATO INSPECTION IN IDAHO

W. H. Wicks, director bureau plant industry of Idaho, advises that the state department is placing in all cars of potatoes a weevil-free certificate by official potato inspectors where the conditions justify a certificate. When potatoes are not in clean sacks or cars are found to contain alfalfa hay or cereal straw no certificate is issued.

This procedure is designed to facilitate the marketing of potatoes regardless of the requirements of the state in which they are shipped. Some cars are not billed directly to states requiring such a certificate, but market conditions may cause the car to be rebilled and diverted to states requiring such inspection. By inspection of all cars and the placing of a weevil free certificate in each one entitled to such certificate, much delay and inconvenience is avoided in case one of these cars is resent to states requiring such inspection.



The railways of the United States are more than one third, nearly one half, of all the railways of the world. They carry a yearly traffic so much greater than that of any other country that there is really no basis for comparison. Indeed, the traffic of any two nations may be combined and still it does not approach the commerce of America borne upon American railways.

—*United States Senator Cummins.*

ASK any doughboy who was "over there" and he will tell you that American railroads are the best in the world.

He saw the foreign roads — in England and France, the best in Europe — and in other Continental countries — and he knows.

The part railroads have played in the development of the United States is beyond measure.

American railroads have achieved high standards of public service by far-sighted and courageous investment of capital, and by the constant striving of managers and men for rewards for work well done.

We have the best railroads in the world — we must continue to have the best.

But they must grow.

To the $20,000,000,000 now invested in our railroads, there will have to be added in the next few years, to keep pace with the Nation's business, billions more for additional tracks, stations and terminals, cars and engines, electric power houses and trains, automatic signals, safety devices, the elimination of grade crossings — and for reconstruction and engineering economies that will reduce the cost of transportation.

To attract to the railroads in the future the investment funds of many thrifty citizens, the directing genius of the most capable builders and managers, and the skill and loyalty of the best workmen—in competition with other industries bidding for capital, managers and men — the railroad industry must hold out fair rewards to capital, to managers and to the men.

American railroads will continue to set world standards and adequately serve the Nation's needs if they continue to be built and operated on the American principle of rewards for work well done.

This advertisement is published by the Association of Railway Executives.

Those desiring information concerning the railroad situation may obtain literature by writing to The Association of Railway Executives, 61 Broadway, New York

Several Records Broken by Higdon Heifer

Ruby Pletertje of Forest Hill 2nd, the great Holstein heifer owned by W. J. Higdon, Tulare, still keeps up the production that placed her at the top of the Pacific Coast senior four year olds with her official record of 39.74 pounds butter from 667.5 pounds milk in seven days. In 30 days she made official production of 162.11 pounds butter from 3,134.9 pounds milk, which is the Pacific Coast record over all ages and the third highest in the world in class. It is also interesting to note that while around 50 cows of all ages have exceeded her seven day record, only 12 of all ages have exceeded her 30 day butter record. During her best seven consecutive days of milk production she made 797.4 pounds, milking over 118 pounds three days with a high day of 118.6 pounds. Her best 30 consecutive days of milk production totaled 3,301.4 pounds, an average of over 110 pounds per day. She will be carried on yearly test and bred to Mr. Higdon's great young sire King Korndyke Pontiac 20th. Harry L. Redd, herdsman at Mr. Higdon's Tulare Holstein farm, under whose care these records were made, rates this heifer as one of the greatest cows he has ever seen and is confident that she will make a yearly record fully in keeping with her short time production.

Ruby Pletertje of Forest Hill 2nd

Two Excellent Records at Kounias Stock Farms

It is not often that a breeder beginning yearly test work has the satisfaction of having the first two cows go above the 800 pound butter mark, but such is the case at Kounias Stock Farms, owned by S. G. Kounias, Modesto. No especial effort was made to secure the limit of production from either cow, as both were milked only two times for a long period of the records. The first to finish was the eight year old Dominita Colantha De Kol, who at the beginning of her lactation period made 26.42 pounds butter from 610 pounds milk in seven days, and 116.34 pounds butter from 2,358.9 pounds milk in 30 days. In 365 days she made 942.2 pounds butter from 24,351.6 pounds milk. The other record was made by Dominita Bonnie De Kol 4th, out of the same dam as Dominita Colantha De Kol. At the beginning of her lactation period she made 20.94 pounds butter from 580.7 pounds milk, and for the year made 839.3 pounds butter from 26,041 pounds milk. Both of these cows rank high as breeding cows as well as producers. Dominita Colantha De Kol has three daughters with official records of 27.48 for a senior three year old, 22.01 for a senior two year old, and 11.31 for a senior yearling. Dominita Bonnie De Kol 4th has one 24 pound daughter and another with 14 pounds as a senior yearling. An interesting newcomer at Kounias Stock Farms is a bull calf sired by Judge Segis, the famous bull at Hollywood Farm, Hollywood, Washington, out of Hollywood Ormsby Segis, a 20.09 pound three year old whose dam is the highest yearly record daughter of Sir Skylark Ormsby Hengerveld, with 1,127.27 pounds butter in one year, and 31.58 pounds in seven days.

Diamond Bar Sale Develops Wide Interest

It is doubtful if any Duroc-Jersey sale to be held in the West is attracting more attention than the sale scheduled by the Diamond Bar Ranch at Spadra for January 28. The principal interest is due to the fact that the offering to be sold contains so much of the blood that is most popular in the East and is the first time that California breeders will have an opportunity to appraise the blood of Pathfinder and the Sensations in local offering. The owners of the Diamond Bar herd believe that what is needed most for the livestock development of this state is to establish our own sources of supply near at home in order that the prospective buyer will be saved the otherwise necessary traveling and express charges, and they feel that their efforts to do just this by making it possible for local breeders to buy the most popular Eastern blood will be appreciated. All arrangements have been made to entertain a large crowd. The sale will be held rain or shine and the whole of the famous herd will be on exhibit, including the well known herd boars, Ace of Pathfinders, Mammoth Sensation Jr. and Great Sensation 2d. Ord L. Leachman will be the auctioneer but the management of the sale will be in charge of Walter T. Gatton who is superintendent of the swine department of the ranch.

COMMITTEE TO SELECT CATTLE FOR HOLSTEIN GUARANTY SALE

Last week H. V. Bridgford, president of California Holstein-Friesian Association, appointed a committee of four to select the registered Holsteins for the Guaranty Sale to be held at Sacramento on March 25, 1920. The committee is composed of Frank L. Morris, Woodland; A. J. Stalder, Riverside; W. J. Higdon, Tulare, and C. L. Hughes, Sacramento. The committee was instructed to complete its work as soon after January 1 as possible, and it is believed that from 60 to 70 head can be selected that will set a new high mark for Holstein quality in western sales. The sale will be managed by California Breeders Sales and Pedigree Company, Sacramento.

World's Grand Champion Duroc Herd
National Swine Show 1919

THE BLOOD of CHAMPIONS

at Public Sale
Wednesday, Jan. 28, 1920

Ace of Pathfinders

Grand Champion at Los Angeles, 1919, headed the World's Grand Champion Duroc Herd at the last National Swine Show. Many of the Sows in our sale will be bred to him for March farrow.

This will be the place to get your under-six-months show prospects and futurity pigs for 1920.

Headed by Ace of Pathfinders

40 - Sows and Gilts - 40

Every One an Exceptionally Good Animal, and Every One Sired by and bred to Prize Winners. An Offering Equaled by Few and Excelled by None.

Notice This Superb Breeding

We will sell Gano sows bred to Ace of Pathfinders and Mammoth Sensation Jr.; Creator sows bred to Ace of Pathfinders; Kings Col. sows bred to Ace of Pathfinders and Mammoth Sensation Jr.; California's Great Wonder gilts bred to Ace of Pathfinders, Mammoth Sensation Jr. and Great Sensation 2nd; Model Chief 2nd sows bred to Ace of Pathfinders, Mammoth Sensation Jr., California's Great Wonder, Sensation 2nd and Orion Reformer; Councillor and Model Triumph sows bred to the above great boars. Note that there is not a sow mentioned that is not sired by a champion boar.

Special Attractions

One sired by Big Pathfinder bred to Ace of Pathfinders; one sired by Kings Col. bred to Mammoth Sensation Jr.; two sired by Creator bred to Ace of Pathfinders. These last mentioned sows are out of our show herd of prize-winners at the 1919 fairs and livestock expositions and are bred to Grand Champions and National Swine Show winners.

Shropshire Sheep

J. F. McSwain, the Poland China breeder of Merced, has recently added to his herd a young boar by Long Chief Again, grand champion of Indiana 1918 and whose dam is by Mc's Big Orange.

W. A. Young, Lodi, recently purchased the Poland China boar Young's Timm Jones from H. Fesenmeyer, Clarinda, Iowa. This boar is by Fessy's Timm, dam by F's Big Jones and described in the sale catalog by Mr. Fesenmeyer as being in the $5,000 class within a year. However, Mr. Young states that he has in "The Whizzer," a spring boar of his own breeding, by Long Big Bone Jr. and out of Black Beauty C., first prize junior yearling and reserve grand champion at this year's state fair, a boar that has been pronounced by both Eastern and Western judges a better boar than the one he secured in the East. He is practically sold out. Recent sales include a boar to Walter Cooms, Elk Grove, and one to John Peterson, Paso Robles.

The Ortega-Underhill Rancho, Santa Barbara, Thos. T. Dinsmore, manager, gives excellent report as to conditions in that great breeding herd of Hampshire swine. The herd is also strong in numbers, while blood lines and quality are A-1. The Santa Barbara herd is just now particularly strong in weanling pigs, both sexes, and there are likewise some excellent prospects in bred sows. Visitors are welcome at the ranch at all times. There is not a ranch with superior equipment for breeding purposes anywhere.

A. W. Morris & Sons, owners of the world famous herd of Holsteins, have announced the purchase of the well known H. E. Coil ranch located one mile northeast of Woodland. By this deal the Morrises come into possession of one of the best ranches in Yolo County and it is their intention to convert it into one of the most modern dairy plants in the country. Possession will be taken early in January and building operations will commence as soon as possible.

While attending the recent Morris sale at Sacramento, J. E. Phillips, who has established one of the select herds of Holsteins at his farm near Fresno, announced that he had sold his Fresno property and purchased a ranch near Dixon, Solano County. Phillips will begin the erection of modern dairy buildings at once and will transfer his herd to the new location as soon as possible. During the past year Phillips has brought from the East a very superior lot of Holsteins that are certain to add much strength to the industry of the state.

R. F. Guerin, Visalia, writes: "Have just completed seven day tests on the following two year old heifers: S. V. K. P. Claire of Sunnyside 24.64 pounds butter from 480.1 pounds milk; S. V. K. P. Oceola of Sunnyside 19.796 pounds butter from 368.4 pounds milk; Katie Hengerveld Butter Girl 16.54 pounds butter from 355.5 pounds milk. The first two are daughters of Sir Veeman Korndyke Pontiac, my senior herd sire now at the head of the Burr Farms at Los Angeles."

On Tuesday, January 27, 1920 Geo. V. Beckman and Sons will make their first offering of Poland Chinas at public sale. For years the Beckmans have been breeding Poland Chinas and have by careful selection and purchases built up a herd from which this offering has been selected. Forty sows and gilts will be sold, 20 of which will be bred to their two herd sires, Matchless Big Bob and Lakeside Defender. Mr. Beckman states that he believes this offering will be appreciated by those attending the sale and every animal sold will be a valuable investment for the purchaser.

The first public sale of H. D. McCune, breeder of big type Poland Chinas, will be held in Hanford, Saturday, January 24, 1920. At this time he will sell 60 head, 40 of which will be bred sows and gilts, the remainder being spring pigs of both sexes. Mr. McCune states that the animals to be sold are true to type, are representative of the most popular blood lines and have been well developed. The bred animals selling will be bred to King's Massive Orange, McCune's Buster and Col. Jack's Surprise.

Fred Gatewood will sell 55 Poland Chinas in Fresno January 10. Of this number 15 open gilts are by Giant Bob and 25 bred sows and gilts will be bred to Fresno Boy, first prize senior boar pig at 1919 state fair and first prize senior boar pig and junior champion at Fresno fair, meeting and defeating 22 boars at these two fairs.

Chas. Gatewood, who disperses his herd of Poland Chinas in Fresno, January 26, states that included in the sale are the two young boars Prospector by Long Prospect and Gatewood's Prospect by Wade's Prospect, which he believes have a wonderful future if they are properly developed from now on. He says he personally selected these two boars to retain in his own herd with the view of mating them with the daughters of Giant Bob.

Z. M. Dickey, Dinuba, who operates a large ranch near Travers and has been a large producer of pork, has decided that he can produce pork cheaper through the use of pure bred sows and boars than by grade sows even though a pure bred boar was used. At practically all the fall sales of Poland Chinas he has been a large and liberal buyer.

W. L. Choisser, Riverdale, recently sold his farm but has secured a part of the Van Cleef ranch and will continue the breeding of Poland Chinas. He has some promising fall litters by the Van Cleef herd boar, Vaughn's Jones, which he expects to develop, and a number will be shown at next year's shows.

Two years ago A. J. Van Cleef, Riverdale, began establishing a herd of pure bred Poland Chinas. At recent sales Mr. Van Cleef has been a liberal buyer, selecting sows of known big type breeding as well as strong individual merit. His present herd boar

Berglunds' Annual Duroc Sale

Dixon, Cal., Thursday, January 15

35 Big Tpye Bred Sows and Gilts — A Few boars

On the above date I will offer, what critics generally concede to be one of the most desirable lots of pure bred Durocs ever sold in California. Twenty-five bred sows and gilts, seven open gilts and three superior spring boars are included. The blood lines represented are as good as money can buy and are the lines of breeding responsible for many of the leading prize winners at recent California fairs as well as the larger Eastern shows.

Many of the offering are either sired by or bred to California Orion King, by a son of Orion Cherry King, that is the sire of two of the three National grand champions and out of a daughter of Joe Orion, the boar that sold for $5,000 when over eight years old. Others are by Chief Defender whose sire was junior and reserve champion at the 1918 state fair and whose dam was grand champion at the same show. Such breeding is a sure source of quality Durocs.

Plan to attend this sale and the state association sale at Davis the day before. You will not be disappointed. Write now for the catalog.

First Annual Bred Sow Sale

California Duroc-Jersey Breeders' Association

University Farm, Davis, Cal, Wednesday, January 14

40 Hand Picked, Bred Sows and Gilts

What We Offer

In this, the initial sale of the official state organization, for the promotion of the Duroc-Jersey, it is but natural that the character of the offering be such as to reflect the greatest credit upon the breed. Accordingly, the leading herds of the state have been drawn upon to furnish a quality such as has never before been offered California buyers.

The offering includes bred sows and gilts carrying the demonstrated blood lines, and every animal is bred to or is sired by a boar that stands in the front rank.

In the pure bred livestock industry nothing is more certain than this fact: The best can only be produced from the best and the fact that the California Duroc-Jersey Breeders' Association stands back of this offering is proof that the entire lot is right and reliable.

Pure Bred Durocs Efficient

Regardless of the price of feed or market prices, no man who is raising hogs on any scale can afford to raise other than pure bred Durocs. Pure bred Durocs have proven themselves in every state in the Union. They outnumber any other breed because they are profitable. In other words, they will make larger and more economical gains than hogs of indifferent breeding. Therefore they mark the way to cheaper pork production costs. Remember this: Pure bred Durocs are not **fancy stock**—they are downright practical money makers.

An Opportunity

This sale furnishes an exceptional opportunity to buy a foundation herd of sows that will not only increase your pork profits but will add to the pleasure of your feeding operations.

Naturally, You Want the Best. Then Breed Durocs Because

1. Durocs fill every demand of the practical hog raiser.
2. Durocs are prolific.
3. Durocs mature rapidly.
4. Durocs breed uniformity in size, type, conformation and color.
5. Durocs are vigorous, hardy, good rustlers and good mothers.
6. Durocs are profitable.
7. Durocs outnumber any other breed.

You can attend this Sale

with the greatest confidence and feel certain that the offering represents the best to be found in California. Come to the University Farm; meet the men who are producing Durocs and make a start on the road to greater pork profits. You'll be welcome.

BRED TO

King's Big Bone Leader and Giant Bob 2nd

Will be sold in my sale to be held in

Ripon, Cal.

Thursday, Jan. 29th

1920

THEY ARE BY SUCH SIRES AS

Blue Valley Tecumseh
King's Big Bone Leader
Young Jumbo---Giant Bob
Joe's King---Model Major
I B A Wonder
Caldwell's Big Bob

This offering should command the interest of breeders and farmers generally and a litter by either of these boars from one of these top sows should prove an exceedingly profitable investment.

The sale will be held on the farm one mile north of Ripon. Ample protection against bad weather.

A hot lunch will be served at noon

Geo. W. Bell, Tulare, Auctioneer

Send immediately for catalog and acquaint yourself with the breeding of the animals offered in this great sale.

LES McCRACKEN, RIPON, CAL.

is Vaughn's Jones, by Giant Jones, a boar he secured from C. A. Vaughn, Hanford, who purchased him while in the East last spring making purchases for his own herd. Mr. Van Cleef is lending his efforts towards establishing new breeders in his vicinity and recently sold three gilts and a boar by Vaughn's Jones to Silva Leoni, Burrel.

Fifty bred Poland China sows and gilts will be the offering of Les McCracken in his sale that will be held on his farm near Ripon, January 29. They will be bred to King's Big Bone Leader, one of the most popular sires on the coast, and Giant Bob 2nd, a son of the 1919 grand champion Giant Bob. The blood lines of the offering have been varied sufficiently to afford the buyer ample opportunity to select according to his needs, and no doubt Mr. McCracken will receive ample support from breeders and farmers alike.

A. A. Jenkins of Tulare reports demand for Jerseys very brisk. He has recently sold three young Jersey bulls. The first two were sons of Gertie's Son's Victor, to S. Hershberger of Tulare, Gertie's S. V. Eminent, whose dam made 625 pounds with second calf; to A. J. Waite of Earlimart, Gertie's S. V. Exile King who won first in his class at the Fresno and Tulare fairs. (His full sister is on test as junior two year old and has made 464 pounds in ten months.) The third bull sold to H. D. Beckwith of Tulare, Gertie's Olga Melia Lad, a son of the R. of M. bull Olga Melia Pogis, a grandson of Raleigh's Merridale Mattie on his dam's side.

Burr Farm, Los Angeles, announces that the farm is offering several pure bred bulls from some of the best producing cows in the dairy. This dairy has been built up through careful selection and through cow testing so that the animals offered are exceptionally choice. Regarding these young bulls Burr Farm writes: "They are of service age and are certainly a

Dispersal Sale

45 Registered Holstein Cows, Heifers and Bulls **45**

20 High Grade Holstein Cows and Heifers **20**

Dixie Ranch, Angiola, Cal.
Friday, January 30, 1920

Mr. Chas. F. Mohnike, present owner of Dixie Ranch, has decided to close out the dairy department, and has instructed us to make a complete dispersal of his good herd. This is an unusually attractive herd of cattle, bred in very substantial lines, and including many individuals of extra good type. The herd is also in excellent physical condition, and we regard the herd as a whole as one of the most promising that we have ever sold. The herd is headed by

Creamcup Fidessa Cornucopia Lad

who is by a son of the 33.35 pound cow Fidessa Bloom and out of Anselogess of Sleepy Hollow who made 32.68 pounds butter in 7 days and 897.08 pounds butter from 22,751.7 pounds milk in one year. Eleven of his young daughters will be in the sale and all bred females are in calf to him.

THE GRADE COWS AND HEIFERS are high class in every way and should prove attractive to dairymen wanting the good ones.

We will also sell 30 Poland China feeder hogs, two teams of good mares, and one new No. 17 De Laval Separator with one horse power motor.

very fine lot, both from the standpoint of breeding and individuality. We will have an official record for the dam of every calf sold and as they are sired by such bulls as Sir Veeman Korndyke Pontiac, Sir Manuel Hengerveld, Prince Juliana De Kol Walker and King Pontiac Netherland Segis 3rd, buyers can be certain that they are going to get bulls that will increase production in their herds. As a result of one of the recent sales from this bunch of bull calves one went to T. C. Wood of Maricopa. This calf is out of Stratford Segis Blanche De Kol 2nd, the cow we purchased at the guarantee sale last spring. She made as a three year old 22.93 pounds of butter, and in five months and ten days she has given on year record 9,989 pounds of milk. Another good bull calf went to Boardman Bros. at Delano. This calf is sired by Sir Veeman Korndyke Pontiac, our herd sire, and its dam is Anatolia, who is a sister to Boweda, the 37 pound cow. Another bull calf went to Joe Telford at Hynes. The dam of this calf is Hodra, a cow that weighs 1,700 pounds, who made on her first month's test 1,700 pounds of milk and 73 pounds of fat."

STATE DUROC ASSOCIATION TO HOLD FIRST SALE

The plans made at the meeting of the Duroc-Jersey breeders at the state fair last September are about to materialize in a sale of 40 head of bred sows and gilts to be sold at the University Farm, Davis, Wednesday, January 14. This is the first sale sponsored by that association and it has been planned as part of the program for the promotion of the breed in this state. So anxious were the members of the association that their initial sale be a source of satisfaction to all that they limited the number to be sold to 40 head selected from the leading herds of the state. It therefore goes without saying that the offering will do much to present the many good qualities of the breed and should furnish an excellent opportunity for the selection of valuable foundation stock. The sale will be the first of a series of similar events to be held throughout the state and the officers expect a large attendance of breeders. Harvey M. Berglund, the sales manager, says that the sows and gilts to be sold will represent the best blood lines available on this coast.

BERGLUND TO SELL DUROCS

Harvey M. Berglund of Dixon, who is managing the state association sale to be held at the University Farm, Davis, January 14, will sell 35 head of Durocs at his farm just west of Davis, the following day. This will be Berglund's first sale and he plans to offer but 25 bred sows and gilts, seven open gilts and three herd boar prospects. The offering is particularly well bred and the sows and gilts will be bred to either California Orion King by a son of Orion Cherry King and out of a daughter of Joe Orion 2d, or to Chief Defender, a son of Johnson's Defender. California Orion King was shown successfully at the state fair and at San Francisco and Chief Defender is a littermate to the first prize junior yearling at the last state fair. His sire it will be recalled was the junior and reserve grand champion at the 1918 state fair and his dam was grand champion at the same show. This sale following so closely the association sale will make it possible for breeders to attend both. Ord L. Leachman will be the auctioneer in each sale.

AMERICAN WAREHOUSES IN PANAMA

Several months ago the first bonded warehouse was erected in Colon, Panama, for the exclusive use of one of the largest rubber manufacturing companies in the United States. Contracts have now been let for a very large bonded warehouse in which American capital has an interest. Space may be rented therein by anyone and it will be large enough to accommodate all.

Make Sure of Your DE LAVAL Cream Separator Early in 1920

There's no happier or better way of starting the New Year right than by making sure of a new DE LAVAL, if you are either without a cream separator or are using an inferior or half-worn-out machine that should be replaced.

For three years now, thousands of those who wanted a DE LAVAL have had to wait weeks for it and many have had to buy a second grade separator. The demand has simply exceeded the possible supply, though more DE LAVALS have been made each year than ever before.

More and better DE LAVALS will be made this year than ever before — as many as available plant additions and skilled workmen can produce—but the demand gives every indication of being even greater still.

Order your DE LAVAL now. Make sure of getting it. Let it save half its cost by Spring.

See the nearest De Laval local agent at once, or write the nearest De Laval office below for any information desired.

California Guernsey Sells for $20,000

Leander F. Herrick, Worcester, Massachusetts, has just purchased from W. H. Dupee, Santee, California, for Anderson Tiffin Herd of Herdlea Stock Farms, New Hope, Pennsylvania, the bull Itchen Daisy's May King of Langwater 17349. This bull was bred by F. Lathrop Ames of Langwater Farms, North Easton, Massachusetts, and was sold a couple of years ago by Joseph L. Hope, Florham Farms, Madison, New Jersey, for $8,000, the then record price for the breed, to B. E. Nixon, Yountville, California. Later he was purchased by W. H. Dupee for use in his Edgemoor Farm herd, where he has been bred to some of his greatest cows. Mr. Dupee reluctantly parted with him but reserved the privilege of having three of his females brought to him for service.

The dam of Itchen Daisy's May King of Langwater is Imp. Itchen Daisy 3d, National Dairy Show winner and Advanced Register cow with a record of 714.10 pounds of fat in Class B. She was sold some years ago for $4,000, an extremely high price at the time. She is dam of the following noted animals: Florham Daisy 18115, 747.08 pounds of butter fat Langwater Dairymaid 26377 with 812.66 pounds of butter fat, sold for $6,150, the then record price for a female; Ne Plus Ultra 15265, noted Advanced Register sire and sire of the record priced bull Florham Leader 55682, sold at two months old at the 1919 Combination Sale by Mr. Herd for $25,000; and Imp. King of the May 9001, Advanced Register sire of 29 Advanced Register daughters whose records average 12,365.3 pounds of milk and 619.80 pounds of butter fat, a large number of records being made as two year olds.

The sire of Itchen Daisy's May King of Langwater 17349 is Dolly Dimple's May King of Langwater 12997 that has a splendid list of tested daughters, including Langwater Nancy 27943, one of the five 1,000 pound cows of the breed, with a record of 18,783.5 pounds of milk, 1,011.66 pounds of butter fat. She was purchased privately by Mr. Herd from Mr. Hope for $7,500 and at the Combination Sale Mr. Herd purchased her daughter, Follyland Nancy 52457 for $12,500, the record price for a Guernsey cow. Langwater Nancy 27943 is also dam of the $25,000 bull calf. In addition to his Advanced Register daughters, Dolly Dimple's May King of Langwater 12997 sired Ne Plus Ultra 15265, thus making Itchen Daisy's May King of Langwater 17349 a full brother to Ne Plus Ultra 15265. Ne Plus Ultra 15265 was a remarkable bull and has some splendid progeny; his tested daughters are all credited with large records, many of them testing over 600 pounds of butter fat, one of them having a record of 712.70 pounds of butter fat. His daughters and sons are highly appreciated, as shown by the valuation put upon them both privately and at public auction, 22 of his daughters having sold at public sales within the past four years for $42,100.

Itchen Daisy's May King of Langwater 17349 has seven tested daughters whose eight records average 536.90 pounds of butter fat at an average age of less than three years. The largest record is 16,350.3 pounds of milk and 727.68 pounds of butter fat, made by May King's Golden Lenore 45587, in Class B.

Fall and Winter Management of Breeding Ewes

Experience has shown that ewes should always be healthy, have good teeth and be strong and vigorous. They should carry a moderate amount of flesh and it is essential that they be so cared for that they will not lose weight during the winter. Well fed ewes are most likely to give birth to strong, vigorous lambs. Ewes that are in good condition will be more liberal milkers and thus better mothers. It is during the suckling period that the greatest demands are made on the ewes, and in order to have the ewes in condition to stand this drain on their systems it is necessary for us to see to it that they are in good condition of flesh prior to lambing. To be sure, to have them in proper condition we must begin in the fall and feed them properly throughout the winter, according to D. A. Spencer of the University of Missouri college of agriculture. This cannot be accomplished in just a few days or even a month.

When the ewes are in thin condition it will be advisable to begin feeding grain along with roughage soon after the first of December. Unless the ewes are very thin in flesh it is not necessary to feed more than a half pound a head daily for ewes weighing 150 pounds. A good ration consists of equal parts of oats and bran or two parts of oats, two parts bran and one part of corn. Where available, it may be economical to feed one-half to two pounds of good clean corn silage per ewe per day and about the same weight of alfalfa hay. Where a good legume, such as clover, alfalfa or soybean hay makes up the major portion of the roughage, it will probably not be necessary to give the ewes that are in good condition any grain until about six weeks before lambing. At this time it may be well to feed the ewes a little grain, about one-quarter pound a head daily of equal parts of corn and oats. In any event in compounding rations the farmer must realize that economy and efficiency should be the watchwords and feed enough to have the ewes gain from 15 to 25 pounds each during the winter.

Sunflower Silage

The overenthusiastic should not be inadvertently misled by the numerous articles appearing from time to time in newspapers and farm journals, exploiting in extravagant terms the feeding value, etc., of sunflower "silage."

It is not my intention to underestimate this product, for be it known the sunflower has great food value as silage, but as in the case of other products its value in a given locality may depend upon climatic conditions, upon soil, upon the method of curing, etc., and it should be made the subject of careful experimentation before decisive reports are spread broadcast.

The sunflower is almost as valuable as the fabled coconut, which produces butter fat, milk, food, fiber, etc., for its tropical owner. The sunflower seed will produce an oil unexcelled for culinary purposes, almost as bland and pure as olive oil. It requires the minimum of culture, it thrives under adverse conditions of soil and climate. In China sunflower seeds, like pumpkin seeds, have medicinal value; in Russia the moujik eats his roasted sunflower seeds as the boys do peanuts. Some day we may have them "salted" as part of the menu, or sold as a confection.

But few insects claim the sunflower as a host plant and birds are the worst enemies, stealing the seeds as fast as they ripen.

About two years ago, W. A. Groom of Boulder, Colorado, cured a quantity of tops of so-called "Jerusalem artichoke," closely related to the sunflower, both belonging to the genus Helianthus, but found the cattle did not relish it. Much would seem to be learned concerning the time for cutting and manner of curing in affecting the palatability of the sunflower as silage.

TEMPERATURE OF WATER FOR SCALDING HOGS

If the scalding water is too hot it sets the bristles. Dr. P. F. Trowbridge, director of the North Dakota agricultural college experiment station, states that 155 degrees Fahrenheit is a good temperature for a barrel scald and that 165 or higher is dangerously high, as it will set the hair if the carcass is left in half a minute too long. The lowest temperature for a slow scald is 140 degrees, but this is too low for out of doors farm practice. A thermometer should be used by the beginner to deter

SANTA ANITA RANCHO

When Writing Advertisers, Mention The Cultivator.

mine the temperature. It will save work, as the right temperature will make the removing of the bristles easy, while too hot a temperature will set them. A tablespoon of lye or a shovelful of wood ashes or a pound of quicklime put in the scalding water will help loosen the scurf.

Dr. Trowhridge further adds: "Cut a gambrel slit in one hind foot for the hog hook. Make a deep lengthwise slit from hock to toe so as to expose both tendons. Scald the head end first, keep the carcass moving so the scald will be even. If the side of the hog rests firmly against the side of the barrel, that portion will not scald, so keep turning it. With very hot water bring the carcass to the air two or three times a minute to cool an instant to prevent setting of the hair. As soon as the hair slips easily reverse the hog, hook in the lower jaw and complete the scald.

DISEASES UNDER CONTROL

Dr. J. P. Iverson of the division of animal industry of the state department of agriculture reports that the anthrax epidemic which has prevailed in the Sacramento Valley is over. This is due partly to weather conditions, but perhaps more to protective measures which have been employed hy the state.

In the control work on sheep scab, about 220,000 sheep were inspected and 71,740 dipped.

The value of control in glanders is shown by the fact that during the past six or eight years not a single case of this insidious disease has been reported. Kings and Tulare Counties are still quarantined for Texas or splenetic fever, where regular inspections and dippings are made for the Texas fever tick (Margaropus annulatus). During October 3,515 head of cattle were inspected and 3,442 dipped. With the cattle protection office charges have been filed against parties slaughtering cattle in violation of the law and the offenders tried and fined.

The work of this office is seriously handicapped by lack of legal advice and service which it is hoped will be remedied in the near future.

ANTITOXIN FROM HORSES PRODUCED BY UNIVERSITY OF CALIFORNIA

Antitoxin has been produced from horses on the Pacific Coast for the first time. Dr. George H. Hart, associate professor of veterinary science in the University of California, today announced that a limited amount of this material is now on hand for distribution at cost of production for use against the botulinus toxin responsible in many instances for forage poisoning in horses.

During the past six months Professor Hart has been developing an antitoxin against the disease by growing the bacillus botulinus in special media under anaerobic conditions. It is then injected into horses in gradually increasing amounts until their serum contains marked antitoxic properties. This serum is then drawn from the hyperimmunized animals under aseptic conditions, filtered through bacteria-proof filters. This constitutes the botulinus antitoxin. Botulinus toxin is responsible for some cases of food poisoning from the consumption of improperly canned foods.

Pig Has Fits

We have a pig about four months old that eats all right and looks well but every once in a while has a fit and starts to roll over. When he comes to himself he starts to run all over the corral. What can be done for him?—Subscriber, Fresno.

These conditions are hard to explain. Some say it is due to glands in the skin on the back of the front legs getting clogged. Usually when such pigs are thoroughly scrubbed with soap and warm water, taking special care to scrub the legs, they get over it. Also get half an ounce of bromide of potash and dissolve it in four ounces of water. Put a teaspoon of it in the feed twice a day.

I Am Confident You Will Appreciate

The Poland Chinas I Will Offer in

Hanford, Cal., Saturday, Jan. 24th, 1920

My First Public Sale of BIG TYPE Poland Chinas

will consist of 40 bred sows and gilts and 20 spring pigs of hoth sexes. Herd boar in service, King's Massive Orange—you all know him—Col. Jack's Suprise by Suprise Prospect and McCune's Buster by Giant Buster. Animals to be sold are hy such noted boars as King's Massive Orange. The Californian, The Jankee, Jr., Lendorris Liberty Bond, King's Big Bone Leader, Young Jumbo and McCune's Buster. Special—a boar and gilt by Suprise Prospect sells.

I believe you will appreciate the class of animals in this sale as they are true to type, representative as to blood lines and have been well grown out.

This Month in the Ornamental Garden

Northern California

By Albert R. Gould

TO OUR readers in this department the writer wishes to convey his best wishes for a successful New Year and hopes that all will spend many happy hours amongst the flowers which not only bring joy to those who grow them but as gifts convey a message of peace and love. The owner of a flower garden can share its pleasures with others and gain experience from nature's own fountain of knowledge. The gardener has never finished learning and may at any moment discover something new. The field is wide and full of interest. Gardening is really the most ancient occupation of the human race and it is one which should be pursued by all who love the beautiful in nature. One can construct a small rock garden, a charming pool, or make a lovely lawn to provide a quiet spot near the residence. Flowers for the table direct from the garden may be secured from a well arranged border planted for succession with annuals and perennials, and the latter once established are useful for many years. What more fragrant flowers would you need than the violet and rose to say nothing of the sweet old fashioned lavender? Plant this last named subject as a border for your winding walks, your violets under the trees and they will form a natural carpet. Choose such roses at Maman Cochet, Hoosier Beauty, Ophelia, Hugh Dickson, Rayon d'Or, Paul Neyron, Cecile Brunner, Lady Hillingdon, Mrs. Chas. Russell, La France and White American Beauty, all good bush roses, and for climbers select from the following: Silver Moon, Merechal Niel, Beauty of Glazenwood, Cherokee, yellow Banksia, and Gloire de Dijon. When preparing the ground for these have it deeply trenched with well decayed manure. Roses of the new varieties are rather scarce this year. We would therefore advise that you place your order at once.

Fuchsias

These plants are very satisfactory and there are now some splendid named varieties which your nurseryman can supply. The following are all good: Phenomenal, Emile Laurent, Storm King and Torpilleur. These are double. Plant in rich soil. They will thrive in shady places under trees or on the shady side of a house. Cuttings of these may also be started now in sand.

"The Yellow Heliotrope"

Many people are fond of the fragrant blue heliotrope. The "yellow" Streptosolon Jamesoni is not quite so well known but it is usually very free flowering and must be planted in a warm unexposed position to thrive as it belongs to the tender class.

A Useful Border Plant

Sea pink (Armeria) is an evergreen dwarf plant having rose pink flowers. Plant small tufts of these six inches apart as they soon spread. It is perennial. Another charming old fashioned plant for the border is the clove scented pink having fringed flowers white and pink, etc.

Cannas

Of recent years this perennial and easily grown plant has been much improved. It is splendid planted in groups of solid color and has long stems for cutting. Some of the best varieties offered now are the following giant flowered in various shades: King Humbert, Richard Wallace, Venus, Mrs. Alfred Conrad, and Wyoming.

Annuals

Sow blue cornflower, candytuft, stocks, snapdragon, Shirley poppy, pansy, godetia, and clarkia, sowing the poppy where it is to flower; the others may be transplanted.

Southern California

By Ernest Braunton

LET us begin gardening operations of the new year with a full realization that we may sow and plant every month of the year. Let us dismiss the notion so many of us brought from Eastern states that spring is the only planting time, for we may sow and plant continuously. There is no colder time, in the average year, than the first week in January, and the weather will constantly grow better for gardening every day thereafter.

This is a time for soil stirring and stirring deeply. The bean growers of Ventura County have stated that deep tillage for three years is necessary before the maximum yield is obtained. It is generally so with all gardening operations. Soil has been tramped upon while wet and beaten down to an air excluding compactness by the winter's rains. Air and weathering is badly needed. Turn it up deeply and leave it in a rough state so alternating rain and sunshine will help pulverize and purify it. If it is turned over several times before seeding and planting better results will follow. If sowing or planting is to be done soon, work in fertilizer now, but if this can be deferred the garden will gain, for much plant food will percolate deeply or wash away if heavy rains follow the application.

Seed Sowing

Every kind of poppy may now be sown and the list is a glorious one, not forgetting our own California bevy of brilliant colors. Time was when we said "California poppy" and sowed seeds of the orange-yellow. But a few days ago the writer saw two girls in a seed store putting up packages of California poppies in each of which there were nine varieties, ranging from white to crimson, with several odd shades outside this line of color transition. Shirley and other poppies are annually undergoing some improvement. Last year the writer grew double Shirleys. But all poppies are good.

Plant also cockscomb, coreopsis, salvia, stock, and all hardy annuals, of which there are a hundred sorts. The outlook now is for a late wet spring so that all native wild flower seeds may be sown with good chance for an abundant flower crop. Sweet peas will prove at their best if planted now for their needs are cool soil for the roots and sunshine for the plant.

Bulbs, Roots and Tubers

For two or even three months now one may plant summer flowering bulbs. With the writer's own hobby, gladiolus, best results year after year have come from January planting. Other timely bulbs are anemone, calla, dahlia (in warm sections), hyacinth, ixia, narcissus, sparaxis and tulips. Some lilies should be planted in every garden and the money for them should be salvaged by cutting hyacinths out of the list. For the money they cost hyacinths provide less than any bulbous plant the writer grows. Water and watch old clumps of 'mums now and take cuttings for new plants if you have a box of sand to put them in. If not, divide the large roots into small pieces about the last of the month and plant out where you wish them to flower. If you are in a warm section you may divide and replant cannas, elephants ears and the like, but it will be weeks before they will start, and a long cold wet spring may rot them unless soil conditions are excellent, so if in doubt postpone until February.

Trees, Shrubs, Plants

There is no better time than now for planting roses, and get them in bare root dormant plants rather than in pots or cans. Roses may also be pruned and fertilizer dug in about

them at any time this month. Such treatment is the necessary forerunner of good spring flowers. All sorts of deciduous and hardy evergreen trees and shrubs are best planted this month, any part of it unless in the very coldest sections of the state. There is a host of summer bedding flowering plants that should be planted for early summer flowers, and you may learn of these by watching the supply of small plants in trays at seed stores and plant depots. Those ordering by mail will find pansy, pink, sweet william, penstemon, phlox, stock and verbena for sale by all.

REQUIREMENTS IN EXPORT OF CITRUS

Frederick Maskew, in charge of state quarantine, suggests that state quarantine guardians in the citrus producing counties should anticipate the requirements on export shipments of citrus fruits, and provide themselves with the necessary certificates. A supply can be obtained from Office of Standardization, Department of Agriculture, Sacramento.

Upon the correctness with which the information demanded in these certificates is supplied and vouched for hinges the continuance of our export trade in citrus fruits to Australia. Australia has based its exemption of citrus fruits grown in California from the provisions of its quarantine regulations on citrus canker, upon certain conditions of certification; in return it naturally expects such officially signed statements to be virtually an affidavit of known facts and not merely a supposition. It would be a farce to make the affirmation required upon an export shipment when the same arrives at tidewater, all wrapped, packed and boxed, and the plant quarantine officers stationed at the maritime ports will not jeopardize this export trade by stating and vouching for conditions of which they have no positive knowledge. Australia is dealing with California in this matter, and the required certificates have been drawn up in a manner to show that the person signing the same is a properly appointed state officer, located at the point of origin of the shipment.

TEACHERS ON ALIEN OWNERSHIP

The Southwestern Order for the Advancement of Agricultural Education, composed of about 100 teachers of agriculture in Southern California, in regular session in Los Angeles city, December 18, 1919, earnestly discussed the seriousness of the rapidly growing alien occupation and ownership of agricultural lands within our state. After careful consideration the undersigned committee was delegated to prepare suitable resolutions and to send copies to the governor, to our agricultural papers and to the chairman of the Better Farming meeting, held in Los Angeles, Saturday, December 20.

Following are the resolutions:

Whereas, more and more of the best agricultural lands of our state are going into the possession of groups and individuals of alien races which are not assimilable and whose people cannot become citizens of this country, and whereas such movement is resulting in a rapid transformation of many sections of the state from American to alien occupation, by practically forcing American farmers to sell to such aliens, and whereas since this movement is based upon alleged illegal practices, it should be halted at once, and whereas our international obligations demand a full and frank adjustment that shall be fair to all aliens concerned, therefore be it resolved that we, teachers of agriculculture of Southern California, do hereby desire to express our concern regarding this unfortunate state of affairs and assert our conviction that those in authority should give the matter prompt and effective attention to the end that justice be given both to American farmers and the aliens concerned.

We further desire to express it as our opinion that no land within our state should be held by any aliens who are ineligible to citizenship or who do not take steps to become naturalized within a reasonable time after entering the country.—Eric E. Nies, Chas. J. Booth, Clayton F. Palmer, Committee.

The first orange trees in Lindsay, Tulare County, were seedlings planted in 1885.

FULLERTON-PLACENTIA WALNUTS

Through the courtesy of Arthur Staley, secretary-treasurer of the Fullerton-Placentia Walnut Growers Association, a representative of the Cultivator made an inspection of the packing house at Fullerton and gleaned a few interesting facts regarding walnuts in that section.

The 1918 crop was 700 tons and the early estimate for 1919 was 800 tons and everybody was satisfied, but as the harvest ended the crop proved to be the largest ever grown, or 1,100 tons. Of these 13 per cent was number two and the remainder number one, though smaller than usual. The budded nuts ran about 68 tons, of which 6,900 pounds were Eurekas. There was also a carload sent down from San Jose to grade and bleach.

The October rains brought over half the crop to the ground and in some orchards the nuts were hard to gather by reason of the mud. This sudden drop taxed the capacity of the packing house and a few growers took their nuts to chili pepper drying houses to dry out and then to the packing house, which will be sufficiently enlarged at once to care for all emergencies of the future. The only by-product shipped is the light nuts and empty shells that are culled out by the vacuum cleaner. These are crushed by the buyer, the half meats and quarters taken out for the confectioner and the shells go to the burner to furnish charcoal for the manufacture of gunpowder.

The old Oakdale tract of 780 acres, south of Oakdale, Stanislaus County, has just been sold and will largely be planted to almonds.

Builds the Essex?

Essex success has not been accidental. No one doubts its right to the position it holds.

But how many know why Essex in its first year revealed qualities more mature, more evident of the influence of long experience, than is commonly found in cars even in their third and fourth year.

You will recall the Essex was announced one year ago without one word as to the identity of its builders. Not a claim was made for its performance.

You were asked to go look at it, take a ride and form your own opinion. The Essex, we said, would have to speak for itself.

Now that it has established itself, we reveal why Essex has all the qualities of cars of long development.

Was Designed by Hudson Engineers

They conceived it as they developed the Super-Six. All they learned about endurance, they incorporated in the Essex.

They gave to the Essex the power that has made it famous in all quarters. Its speed is the result of what had been learned in making the Super-Six winner of all worth while speed records.

The Essex can never be all that the Super-Six is for they are totally different types.

But the Essex does bring quality and performance to a class field that was unknown.

The former owners of large, costly cars that have adopted the Essex have not been Hudson users. They have come from other cars, cars that fall short of the Super-Six in all particulars save size and cost.

The Essex appeals to such users because of its nimbleness. They like the way its performance compares with that of the Super-Six. You can see this on every hand. The two cars in any community that are most prominent because of their performance ability are the Hudson Super-Six and the Essex.

Essex Did Not Need Hudson's Endorsement

Think of the advantages Essex has had. What ordinarily would have required years to perfect was made possible in the very first model.

That is why 20,000 are now running, why more than $30,000,000.00 was paid for Essex cars in ten months.

You have not needed the Hudson endorsement to understand Essex performance.

Essex has won its own way. Hudson gave it full benefit of the experience of its engineers and the ability of its manufacturing organization. Its name was not needed.

Now Hudson takes the same pride in acknowledging its kinship to Essex that a father might in speaking of his son who on his own account had made good.

Hen or Incubator, Which?

By Jean A. Koethen

THE respective merits of the hen and the incubator as hatchers are, for the most part, relative. Under certain circumstances a hen does the most satisfactory work. Under others the incubator is the only hatcher to be thought of for a moment. Between the two there is a wide range of "ifs" and "buts."

From tests made at various times at different experiment stations it seems quite certain, that the hen, is she is the right sort of hen and is properly managed, will hatch a larger proportion of fertile eggs than will an incubator. In tests made at the Oregon station in April, May and June results were decidedly in favor of the hens.

1. From 879 eggs set, incubators hatched 533 chicks, or 60.6 per cent.

2. From 279 eggs set, hens hatched 219 chicks, or 78.8 per cent.

3. Eliminating eggs broken in nests the hen hatched 88.2 per cent of eggs set.

4. The incubators hatched 78.5 per cent of fertile eggs, and the hens hatched 96.5 per cent.

5. Eggs incubated artificially tested 22.7 per cent as infertile while those incubated by hens tested out 11.8 per cent.

6. The incubators showed 16.6 per cent of chicks "dead in the shell" and the hens 2.8.

7. Chicks hatched by hens weighed heavier than chicks hatched in incubators.

At the Ontario agricultural college experiments gave the following results: Nine hundred and fifty-eight eggs were set in the machines and 436 chicks were hatched, or 45.5 per cent of the eggs set. Three hundred and thirty-five were set under hens and 196 chicks were hatched, or 58.5 per cent of the eggs set. The same eggs were used in both tests.

Of the above figures the most significant are those in 3, 4, 5 and 6 of the Oregon station results.

We notice, first, that when eggs broken in the nest were eliminated the hens hatched 88,2 per cent. What per cent would they have hatched if the broken eggs had all been counted? This depends on the hen. As a rule, the heavier the hen the more eggs she breaks. When I was hatching with Orpingtons I rarely failed to lose three or four eggs out of the hatch. Some were broken early in incubation, and these big hens rarely failed to trample to death one or more of the first chicks that hatched or tried to hatch. They did not seem to realize what was going on until hatching was well under way. Light Brahmas are as clumsy, but Rocks and Reds are much less inclined to break the eggs or crush the chicks.

Notice also that the hens hatched 18 per cent more of the fertile eggs than did the incubators. It is a mystery, and yet a well known fact, that a germ which is too weak to develop in the incubator will sometimes develop under a hen. Some of the germs in 5 were evidently of this kind—too weak to even make a beginning of development in the incubator and yet strong enough to develop under hens.

Eight times as many chicks died in the shell under incubator conditions as under hens. It is a question if there is much significance in these figures. The death of chicks in the shell seems to depend more on the weather or on conditions peculiar to the season than on method of hatching. In some seasons many of the chicks incubated by hens die in the shell. Moisture seems to have something to do with these untimely deaths. Ventilation or the lack of it has undoubtedly some influence. Such deaths often occur under a hen that stays too closely on the nest. When all is said and done we really know very little of the cause of these deaths. Lack of vigor may be quite as much to blame as faulty incubation, and keeping the eggs too long more to blame than either.

A Question of Expediency

But our choice of a method of incubation is determined less by the actual quality of the method than by necessity or convenience. When only a few chicks are to be hatched, a hundred or so, say, it is hardly worth while to invest in an incubator. This is a lesson hundreds of backlot poultry keepers have learned by bitter experience. There is something so fascinating in the idea of hatching chicks by the wholesale, and the sight of 50 or 100 fluffy-ruffles coming out of the shell at the same time is so alluring that we have to have our fling and perhaps it is worth while for the sake of experience and for the fun there is in it at first.

If every backlotter who attempts to use an incubator had a suitable place in which to run it, the story might be different. Last year I heard of a woman who bought an incubator and actually ran it on the back porch. Not a chick hatched, of course, and she was terribly disgusted as well as disappointed. The number of women who have tried to run incubators in the kitchen or a shed or an unused bedroom is tragically long, I fear, if all were known. The incubator must have an even temperature, hence most experts run them in cellars or in rooms which are partly underground. If the incubator room is above ground it must be built with openings that can be covered when necessary so that the temperature of the room will not vary much between noon and midnight. A certain amount of change the thermostat can control, but not too much.

But if expediency requires that the hatching in small flocks be done by hens, it is equally imperative that incubators be used in large flocks. Probably 95 per cent of the chicks hatched in California are hatched in incubators, and well hatched, too. A hen under the most favorable conditions may hatch a few more chicks from 100 eggs than will an incubator, but she is not so easy to control. The incubator may fail now and then to develop a germ, but neither does it trample the chicks to death. It may not always provide the exact amount of moisture required, but neither does the hen. Human intelligence, in our climate, must regulate the moisture for both.

The Human Factor

After all the question of choosing a method of incubation simmers down very largely to the question of the human factor involved. Which would you rather run, an incubator or a hen? I have seen men and women whose yards were full of broodies hatch with a machine because they "couldn't bother with a hen." On the other hand I know at least one person who would rather sit up nights with sitting hens than attempt to run any kind of machine. Our gifts are not all alike. The hen is a trial to those who do not understand her, and I suspect there are several folks in the world who haven't it in them to run an incubator. Fortunately it is not absolutely necessary to do either.

In these days of specialization two other courses are open. There are so many good hatcheries, large and small, so many breeders selling chicks by the hundred or by the thousand, that one who does not care to hatch can always buy chicks. Many large commercial plants have not a male bird on the place. They buy their chicks in lots of 500 or 1,000, brood them around the large brooder stoves, sell off the cockerels when they reach broiler size, and fill their houses with pullets only.

Worn Piston Rings waste power and money

You can't afford to have them in your engines. You need all the power your motors can develop. McQuay-Norris LEAK-PROOF Piston Rings increase motor power. Not in any mysterious way—but because their equal action all around the cylinder wall prevents fuel from escaping. This insures full compression and consequent power. Their design is exclusive—can be had in no other ring.

These rings have increased power, saved fuel and decreased carbon for more than nine years. They are made in every size and over-size to fit every make and model of motor, tractor, truck or passenger car. Your dealer has them or can get you proper sizes promptly from his jobber's complete stock.

Write for Free Booklet →

We will gladly send, without charge, our booklet, "To Have and to Hold Power," which explains why worn or imperfectly designed piston rings waste power and money. Address Dept. AB

McQuay-Norris Manufacturing Co., St. Louis, U. S. A.

To Control Excess Oil
A special ring for motors that pump oil. Use in top grooves of each piston. In the lower grooves use McQuay-Norris LEAK-PROOF Piston Rings for complete compression—power.

Custom Hatching

The poultry keeper who wishes to breed from his own stock may, if he does not care to do his own hatching, find someone in his neighborhood who will hatch his eggs for him. Custom hatching is a comparatively new thing in California but it has come to stay. It is a great convenience for those who do not like to hatch with hens and are not so situated that the use of an incubator is practicable, to be able to take their eggs to someone who will hatch them for three or four cents apiece. An incubator run by an expert is more efficient than a hen that is not tactfully managed. If you are not getting good results, better take your eggs to an expert and save yourself disappointment, worry and loss.

Letting the other fellow do your hatching is especially to be recommended early in the season when broodies are hard to find. Many fanciers use the small incubators in order to secure early chicks, and this is an excellent plan if one has a suitable place to run it in. If one has but a few settings of eggs to incubate and no incubator cellar, he is fortunate indeed if he can get his eggs into a big incubator under the care of an expert. I visited a woman recently who is running a dozen big incubators filled with eggs from her own flock and those of her neighbors, and finding the venture profitable and satisfactory to all parties. Almost every community in California could support such a hatchery as this, and the day is not far distant when we shall turn the greater part of our hatching over to such specialists.

All Under 50 Per Cent

While individual records were very high, the average yearly production for the various breeds was less than an egg every other day, except for R. I. Whites, a fact which indicates that the 200 egg strain is still in the distant future. White Leghorns averaged 179 eggs for the year; R. I. Reds, 143.9; R. I. Whites, 180.4; Barred Rocks, 149.19; Wyandottes, 158; Black Minorcas, 162.8.

The average per cent production for the 35 days from October 1 to November 4 was 19.9 for Leghorns, 23.1 for R. I. Reds, 31.1 for R. I. Whites, 31.9 for Barred Rocks, 35.7 for Wyandottes and 12.5 for Minorcas. It is because of their cold weather production, doubtless, that the heavier breeds make as good a showing as they do beside Leghorns.—J. A. K.

HATCHING WITH HENS

Sitting hens should be confined to slightly darkened nests at hatching time and not disturbed unless they step on or pick their chickens when hatching, in which case the chickens should be removed as soon as dry, in a basket lined with flannel or some other warm material, and kept near a fire until all the eggs are hatched; or the eggs may be removed and placed under a quieter hen whose eggs are hatching at the same time.

An incubator may also be used to keep the earliest hatched chickens warm, in case they are removed from the nest. If the eggs hatch unevenly, those which are slow in hatching may be placed under other hens, as hens often get restless after a part of the chickens are out, allowing the remaining eggs to become cooled at the very time when steady heat is necessary. Remove the egg shells and any eggs which have not hatched as soon as the hatching is over. Hens should be fed as soon as possible after the eggs are hatched, as feeding tends to keep them quiet; otherwise many hens will leave the nest. In most cases it is best that the hen remain on the nest and brood the chickens for at least 24 hours after the hatching is over.

POULTRYMAN'S CALENDAR—JANUARY, BEGINNING INCUBATION

Many incubators were started and some hens set in December this year, for the "Hatch Early" bee is in everyone's bonnet. In January the one thought in the poultryman's mind is hatching. Every broody hen available should be set this month. If you have no hen, take your eggs to a custom hatcher. There is pretty sure to be some one within reach who will hatch your eggs for you. If you have a cellar or plastered room for it, you might try one of the small incubators. The farmer or small poultry man who wants a few hundred Leghorn chicks will do well to buy them from a reasonable breeder or hatchery, and save himself the trouble and expense of hatching.

However you do it, make a start this month toward getting out the chicks to raise into fall producers.

THE MOST PROFITABLE BREED

A correspondent recently asked for comparative figures as to feed cost and relative profit of different breeds. The final report of the All Northwest Egg Laying Contest for 1918-1919 had not then come in. The figures it gives are extremely interesting.

The feed cost of the various breeds for the 35 days from October 1, 1919, to November 4 was as follows: White Leghorns, 31.79 cents; R. I. Reds, 40.18 cents; R. I. Whites, 38.61 cents; Barred Rocks, 39.81 cents; Wyandottes, 32.09 cents; Black Minorcas, 31.51 cents. This is a little less than a cent a day for Leghorns, Wyandottes and Minorcas, and a little more than a cent a day for R. I. Reds, R. I. Whites and Barred Rocks. These figures correspond quite closely with those given for the month of January, 1919, and are doubtless substantially correct for all seasons with feed at present prices.

The return above feed cost for the same period was 10.1 cents for Leghorns, 8.4 cents for R. I. Reds, 26.7 cents for R. I. Whites, 27.3 cents for Barred Rocks, 42.9 cents for Wyandottes and 5.1 cents for Black Minorcas. Just why Leghorns should have given a return so much smaller than that of Wyandottes is a question not easy to answer. Possibly the Leghorns were molting or the weather was cold and rainy. From other figures given during the contest it appears also that the Wyandottes entered were unusually productive. The high pen for the year was a pen of White Wyandottes which made a record of 1,211 eggs—an average of over 200 eggs—with a sales value for eggs of $54.45, nearly $11 per hen. The high hen in the contest, however, was a White Leghorn, which made a record of 290 eggs. The second hen was a Leghorn with a record of 278 eggs, and the third a Rhode Island White, which made a record of 271 eggs.

KEEP BROOD COOP CLEAN

The brood coop should be cleaned at least once a week and kept free from mites. If mites are found in the coop it should be thoroughly cleaned and sprayed with kerosene oil or crude petroleum. From one to two inches of sand or dry dirt or a thin layer of straw or fine hay should be spread on the floor of the coop. Brood coops should be moved weekly to fresh ground, preferably where there is new grass. Shade is very essential in rearing chickens, especially during warm weather; therefore, the coops should be placed in the shade whenever possible. A corn field makes fine range for young chickens, as owing to cultivation of the ground, they get many bugs and worms and have fresh soil to run on most of the time and enjoy abundant shade.

Mark the New Chicks

All the chickens should be toe-punched or marked before they are transferred to the brooder or brood coop, so that their ages and breeding readily can be determined after they are matured. Farmers frequently keep old hens on their farms and kill the younger hens and pullets, because they are unable to distinguish between them after the pullets have matured.

More than 3,000 applications of pumping plants for electrical service are on file in the office of a power company at Fresno.

The Reliable Blue Flame Wickless Oil Heated Hover

This Hover Represents Our 30-Inch 42-Inch and 52-Inch Sizes.

THE MODERN HOVER

This hover has the same chick capacity as the coal burning brooder. They are made in four sizes, 18 inch, 30 inch, 42 inch and 52 inch hover. A few of the special points on this oil heated hover are as follows:

Burns Coal Oil
Steady Blue Flame
Comfortable and Easy to Operate
Economy of Operation
No Wick to Trim
No Oil Fumes
Visible Oil Feed
Convenient and Safe
No Coal, Smoke or Gas
The Flow of Oil Is Regulated Automatically
Abundance of Heat

FARM LANDS FOR SALE

100-ACRE FARM $4,000
WITH PAIR HORSES AND
Six cows, poultry, manure spreader, corn, potato planters, threshing machine, mowing machine, gasoline engine, harness, wagons, harrows, plows, long list complete implements. On main road, only 4 miles to big RR. town, productive loam tillage, brook-watered pasture, estimated 500 cords wood, 75,000 timber; fruit; 6-room house, two barns, silo, carriage, poultry houses, etc. Owner to retire now sacrifices everything $4,000, easy terms. Details page 8 Strout's Farm Bargains 23 States; copy free. E. A. STROUT FARM AGENCY, 831 AG, N. Y. Life Bldg., Kansas City, Missouri.

For Sale—Orange Cove, Tulare County. This grove is 5 years old, 40 acres and planted so that all fruits do not mature at the same time; 22 acres navels, 5 Valenclas, 3 lemons, 10 olives. Good well and pumping plant. All underground 8 inch cement pipe line and 12 inch 4 gate valve stand pipes for every tree row. On paved boulevard and 1 mile to town, school, RR. station and packing houses. Orange Cove is a live, young town and the safest place in California for oranges. Not frostless but safe for all citrus fruits. Can divide this 40 if necessary as each 20 has its own pumping plant. For price and information see M. S. ROBERTSON, 313 Story Bldg., Los Angeles.

Snohomish County, Washington — 6,000 acres of the finest dairy, berry or general high grade farm lands in the northwest; rapidly improving section; no drouths, bumper crops; tracts, 1 to 80 acres; ten yearly payments. This is your opportunity. Send for literature. Brownell Land Co., Birmingham, Washington.

For Sale—Five and 35-100 acres exclusive of roads three miles N. E. of Redondo Beach, California. Being the North six of lot 7 McDonald tract, San Pedro Rancho. Address Jas. T. McPherson, Box 685. Willows, California.

For Sale—240 Acres good alfalfa and orchard land; good climate; 58 miles from Los Angeles. All fenced and cross fenced. Also have some improved land nearby. John Rouff, Palmdale, California.

TREES

Nursery Stock. Apples, pears, peaches, cherries, prunes, plums, berries, etc. OURS IS MAIL ORDER SYSTEM. IT SAVES YOU MONEY. Write us now for Planters' list. 20 years in business. Carlton Nursery Co., Carlton, Oregon.

For Sale—Valencia and Washington Navel Orange, Eureka and Villa Franca lemon and Marsh's grape fruit trees. One year old on sour root. J. S. Ogawa. R. A. Box 114a, Sanger, California.

Wanted—Black Walnut seedling nursery. Will buy or graft on shares. Have my own scions, Eureka and Placentia Perfection. The Walnut Nursery, W. A. Litten. Prop., Whittier, California. Phone 6294.

For Sale—Unrooted Grape Cuttings; also a limited supply of rooted Tokay and Cornichon grapevines, and several thousand almond trees. Burke's Nursery, Lodi, California.

For Sale—Orange seedlings, sour and sweet. Budded valencias, lemons, navels. Paul B. Magee, R. F. D. No. 2, Box 499, Pasadena, California.

For Sale—French prune, 4x6 and 3x4 on almond, peach and Myrobalan root. Write at once for price. Box 43, Porterville, California.

You Want To Plant GOOD olive, persimmon, and citrus trees; thornless blackberries, etc. Bishop's Nursery, Highland.

For Sale—One year old Valencia Oranges and Eureka Lemon trees. Very fine trees. Ketscher's Nursery, Santa Ana, California.

For Sale—3,000 select orange trees. Also 3,000 lemon trees; first class trees; 20,000 seedbed stock. A. R. Rideout, Whittier.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

POLAND-CHINAS

Wondergerst, California's leading Poland China sire—big himself, bred big and his pigs show the same qualities. His dam was Giantess Wonder, his sire Big Jones—both big, both winners—a combination of the greatest blood of the breed. Breed big type Polands. Start right by using this blood. Write for special offer. A liberal consignment made to the Tulare Poland China Associated Breeders' sale held Tulare, October 21st. OXBONE Herd Poland Chinas, Tipton, California.

Inspection Invited. Don't miss this opportunity.

THE JAPANESE PERSIMMON

(Continued from Page 3.)

It is now grown more widely than any other variety.

The Tanenashi is also a favorite but is rapidly losing ground to other varieties. It is large and of fine flavor, with rather mealy flesh, but an unfortunate tendency in some localities to crack at the calyx end. Other varieties commonly found are the Maru, the Tsuru and the Tamopan, the latter being one of the non-astringent varietles of a very peculiar shape, having a characteristic construction which makes it look like two fruits joined together.

Of High Nutritive Value

The persimmon is a fruit high in nutritive value, running much higher in sugar content than such fruits as the apple, peach, apricot and nectarine. It is rather to be classed with the fig and prune in this respect, containing nearly 20 per cent of sugar.

Yields and Returns

A good persimmon tree may be expected to yield some 400 pounds of salable fruit. With 100 trees to the acre this would give a yield of 20 tons, which will be recognized as a very heavy yield. However, as mentioned above, in California the persimmon is notoriously prolific, and such a yield is not improbable. The writer knows an orchard of four year old trees that this season produced a ton of fruit to the acre. Prices usually average somewhere in the neighborhood of six cents per pound, which one can readily see makes persimmon growing a very profitable industry at the present time. Even if prices dropped to four cents, which they might do with a big increase in acreage, there would still be big money in the industry, for with a yield of 15 tons a grower's gross returns would be some $1,200 per acre, a figure that almost seems fabulous. It is the writer's firm belief that 25 years from now California will have a thriving and growing persimmon industry of very respectable proportions.

LITTLE SWEETHEART IS HOME AGAIN

Little Sweetheart has won many hearts and all kinds of honors and is again back at Hillcrest Farm. Her best lover, T. S. Glide, owner of Hill crest, writes:

"I wish to announce that Little Sweetheart arrived home last Saturday after being on the road for two weeks from Chicago. As near as I know she is the only cow to win the high honor at Chicago from the Pacific Coast and has won more grand championships on the coast than any other cow ever won in one year, quite different to her showing in 1918 when I showed her at the state fair and there were eight in her class and she stood eighth. This makes two championships from Chicago for this herd; junior and reserve champion bull 1904 (King Edward) and grand champion cow 1919. In figuring up her winnings for this year I find that she won a little more than twice what I paid for her in 1918. I bought her back after the sale in Portland and she is now on Hillcrest Farm where I shall be pleased to show her to any who wish to call and see her. With best wishes for the new year."

SALE OF DUROCS

On Thursday, January 29, at Exposition Park, Los Angeles, one of California's finest herds of Duroc-Jersey hogs will hold its first public sale. The Winsor Ranch herd, located at Bonita, San Diego County, and in charge of R. K. Walker, formerly of Peters, Lamson & Walker, and Morris C. Allen, is the oldest established high class herd of Durocs in Southern California. In this Los Angeles sale the Winsor Ranch is offering to the public a class of animal on which they expect their whole herd to be judged. Nothing will be put in the sale that they do not consider would be a valuable producing sow if left in their own herd.

The 40 sows and gilts that make up the offering are the equal in both individuality and breeding of the hogs that are going through the big sales in the corn belt today. They are sired by the greatest boars of the breed, including Great Orion Sensation, the present world grand champion; Great Wonder, the largest Duroc that ever lived; Great Wonder, his sire and a grand champion at Iowa; Orion Sensation, the first prize senior yearling at Iowa this year and a littermate to Great Orion Sensation; Grand Model, an Iowa grand champion; Great Model, the wonderful breeding boar owned by the Winsor Ranch; Top Sensation; Orion Fancy King, a son of the $20,000 Fancy King Orion; Grand Model Again, the sire of the seven times grand champion sow Model Defender Lady, and Grand Model 8th, the 1,060 pound first prize aged boar at the Iowa state fair.

Winsor's Giant Orion is the largest boar that ever saw the Pacific Ocean. He measures just two inches less than seven feet from between his eyes to the root of his tail, is 40 inches high and welghs 965 pounds. He is sired by the world's grand champion of 1916, Orion Cherry King Jr., and is the largest boar of the Orion Cherry King family. Great Sensation 3rd is sired by the king of all big type sires, Great Sensation, and out of Uneeda Lady, the $5,000 sow. Five of this sow's six months pigs recently sold for $8,000 and two resold for $8,500.

A SUNNY HEART

"There is a gift that each must give himself;
Gold cannot buy it for it has no price;
It does not fade with years, it makes of earth
For one who has it a small paradise.
"Wise is he who gives himself this gift
When he is young, for joy it can impart
To all his life and others who know him;
It is a simple gift—a sunny heart!"

IN SPITE OF TERROR

By Gardner Hunting, in Youth's Companion

THE little motor boat, The Chip, had obtained her supply of gasoline from the tank boat, Hippo, anchored off the club's mooring ground in the lower bay of New York. As she turned away, the sharp putt! putt! of her exhaust sounded positively cheered and refreshed, and her green nose pushed its way saucily across the inlet toward her red buoy, just as if she were a conscious little being who was feeling very pert and happy after a long, cool drink.

Billy Hanscombe threw in the high-speed clutch and grinned at Claude Inness, who sat on the forward seat with his hand on the wheel. Billy nodded toward the red peak of his anchor mark to be sure that Claude understood. It was a matter of pride with Billy to pick up the buoy always at the first try. Duly warned, Claude swung The Chip a little farther to port, and grasped the boat hook with his free hand.

The last rays of the afternoon sun were staining the whole surface of the lower bay a brilliant orange. The spreading wake of the motor boat slashed the water with gold and purple ripples. As the little craft neared her mooring place and Billy shut off the engine, the shining expanse of water took on a bronze sheen.

"I wouldn't mind sleeping out here in the boat on a night like this," said Claude, as they made fast to the buoy.

"Seems as if it would be safe, doesn't it?" responded Billy.

"Of course! What's likely to be dangerous about it?"

"Oh, nothing, I suppose. I guess father would hardly think we ought to take the chance, though."

"What is there to be afraid of, here in this anchorage, with the cottages within hail and a hundred boats round us? Doesn't anybody ever sleep out on the boats?"

"Oh, yes; some of the fellows bunk quite often on the larger sailboats. But they always have a tender tied up astern."

"How about the family that's on the gasoline boat?" said Claude. "They live there all summer, don't they?"

"Yes, but the Hippo's about seventeen times as large as The Chip."

Claude looked back at the graceless bulk of the tank boat. "It must take nerve to live with a couple of thousand gallons of gasoline."

Billy glanced toward the club. He and Claude must wait where they were for a dinghy to put off from the landing there. Usually the man on the dock was watching for the last boat to anchor; he seldom needed to be hailed. Tonight he was slow. Billy looked about at the little anchored fleet. Apparently all the usual boats were in early; every buoy had its craft, lying at the end of a slack line until the tide should begin to ebb. And apparently every boat was tenantless. Billy stood up to hail the shore.

"What would happen if all that gasoline should explode at once?" asked Claude.

Billy had heard that question discussed. "Father said once that if such a thing should happen, it would probably destroy every boat on the anchorage."

"I'd hate to take the risk that man and his wife and baby take," said Claude, more seriously. "I didn't even see a tender there."

"The club boat takes care of them, as it does of us," said Billy.

The two boys looked again at the red-and-black tank boat. The orange color was fading swiftly from the water now. The tide was beginning its outward flow; boats were straightening their mooring lines to its pull. The sun dropped to the horizon; New York lay under an evening haze; a faint boom came rolling across the water from distant Staten Island. Then a succession of heavy discharges shattered the peace of the day, as club after club fired its sunset gun and hauled down its flag. Lights popped up here and there. Billy looked again toward the club dock.

Suddenly Claude uttered an exclamation. "Billy!" he ried. "Looks as if they had a fire there now!"

"Where?"

"The tank boat!"

Billy's eyes turned to the squat, fat heavy-ended craft. Her red tanks and black hull looked like a dull dun shadow now, but the boy's heart gave a great leap of apprehension when he saw a rose-yellow point of flame dart up just beside the low deck house.

He stared, unwilling to believe his eyes. Many times he had heard people remark after sudden accidents, "Why we were just talking about it when it actually happened?" For an instant he felt a direct connection between his idle talk with Claude and this alarming danger.

The boys could see well enough to be quite certain that no one was moving about on the open deck. If the red tongue of fire that leaped and dropped and leaped again, like a wig-wagging flag, was an uncontrolled blaze, no one aboard seemed to know it.

The whole inlet was quiet, the club dock still vacant. Billy gasped when suddenly the rose flame raised its smoking head high and shook it, like a great, hideous snake of fire about to strike.

"Hippo, ahoy!" he shouted with all his might.

There was no answer and no movement on the threatened craft. There was a sudden puff of black smoke, spangled with sparks, from the deck of the tank boat, and a mushroom of thick cloud rose over the vessel. A dull, blowing noise, like the quick draft of big bellows, came to them. Then a black figure ran out from the deck house, and a woman's wild scream rang across the water.

The two boys looked at each other. Claude was pale, and Billy knew that his face, too, must be white. He and Claude, on board The Chip, were the persons who could most surely and promptly bear the desperately needed aid. Yet those huge tanks of gasoline might explode at any moment.

Billy threw back the hood of his engine and turned the gasoline cock With his hand on the crank, he looked up, and saw Claude casting off.

"Go to—her—stern!" he gasped, as he tugged at the flywheel in order to start his engine. Then, as the little machine buzzed, he waved his hand.

In a moment The Chip was turning in a short circle. Billy thought only of the tiny, helpless baby he had seen on the tank boat and the running black figure that had screamed. The woman was still screaming; her husband was now beside her at the rail of the boat, with the baby in his arms. The whole end of the deck house toward them seemed already ablaze. The big gasoline tanks occupied the other end of the boat, and were yet untouched, but the fire spread as if everything aboard were oil-soaked. To Billy, it seemed as if the distance between the Hippo and The Chip's buoy had stretched out into a terribly long space. He set his teeth and jammed the engine lever into the high speed

Claude looked once over his shoulder. Billy felt a vague surprise that his chum's face was streaked with sweat. Then he put his hand to his own face, and found that it, too, was wet. He looked again at the tank boat. If they could get to it and away to the shore before the fire reached the gasoline, they would all live. If not, nothing on earth could save any of them!

In a few moments they were turning in under the overhanging end of the large craft. Billy stopped the engine and caught the line that the woman flung out to him.

The woman, tall and slender and frail looking, let down a side ladder that lay flat against the tank boat's hull. Billy drew The Chip in close The woman stepped down and over the gunwale into the boat.

"He's broken his ankle!" she gasped out to Billy. "The waste took fire, and he was trying to get us out." She reached up for the wailing baby, which her husband was already lowering, by

AUSTIN

FARM DITCHER, TERRACER AND ROAD GRADER

A machine that will save you money and labor. It is the ideal implement for digging drainage ditches. It cuts a mile of V-shaped ditches to a depth of four feet, in a day.

The **Austin** Ditcher is unequaled for terracing hillsides, backfilling ditches and grading and repairing roads.

This handy implement is inexpensive and will prove the busiest and most useful machine you have. Write today for illustrated folder.

Most of our towels are not worth darning or careful mending, but pieces from them make excellent wash cloths, holders or polishing rags.

its long, loose clothing, into her arms.

"Say," the man shouted, hoarsely, "somebody ought to open the tanks at the top! If that gasoline explodes, there won't be enough left of this here fleet to write your name on! I fell through the companionway and broke my foot. Can you do it?"

Billy's heart stopped. He understood. Gasoline, confined, would explode at the touch of fire; with the tanks open at the top, it might not. The whole bow of the boat seemed sheathed in flame now, but he ran up the ladder to the deck of the boat.

The tank boat man quickly told him how to raise the iron tank covers; then he let himself painfully over the side.

(Continued next week.)

"SPECIAL" LAMB RECIPES

In the Cultivator of December 20 notice was given of a beautiful booklet issued by the National Wool Growers Association, with headquarters at Salt Lake City. The booklet was entitled "Whetting Uncle Sam's Appetite for Lamb" and contained some very attractive and appetite provoking recipes. Here are some of them:

Roast Shoulder of Lamb

Remove the bone and fill the space with a moist stuffing made with grated stale bread crumbs, highly seasoned with butter, salt, pepper and thyme. Add the yolk of one or two eggs and enough warm water to soften the bread thoroughly. Put the bones and scraps of meat in a kettle with barley water enough to cover, lay the stuffed shoulder on them and let the whole simmer gently for an hour or more to make it tender. Lift onto the rack in a roasting pan, dredge with salt, pepper and flour and bake an hour or till tender. Use the water in the kettle for basting and for gravy, with a little butter and flour at the last to froth the surface. Garnish with forcemeat balls made from its own trimmings.

Breast of Lamb

Put the breast in a pan containing just enough water to cover it, salt and simmer it until the bones break from the flesh. Draw the bones out and spread a forcemeat of crumbs, egg, thyme, sage and butter over the breast. Season with tomato catsup or sauce. Place in oven until brown and serve on a bed of steamed spinach, or, if you use onions, with a garnish of them.

Curried Lamb

One and one-half pounds lean meat from middle neck or leg of lamb, one tablespoon curry powder, salt, one tablespoon tomato sauce, one teaspoon curry paste, one and one-half ounce butter or drippings, three-fourths ounce flour, juice of one-half lemon, two small onions, one-half sour apple, one teaspoon chutney, six ounces Patna Rice, three-fourths pint stock or water.

Finely mince the onion and apple. Heat the dripping and fry the onion, remove it, reheat the fat and brown the pieces of meat. Return the onion to the pan. Mix together the flour, curry paste and curry powder and sprinkle them with the lemon juice over the meat. Cover the pan and cook the curry very gently for ten minutes to develop the flavors. Shake the pan from time to time to keep from burning. Add the stock gradually, mixing it smoothly. Put in the apple, tomato, chutney and salt, and simmer gently two to two and one-half hours, covering the pan closely Shortly before the curry is to be dished, boil the rice and arrange in a border around the curry.

Ragout of Lamb

Cut into dice one pint of cold roasted or boiled lamb. If boiled, dredge with flour and brown in butter. Add one small onion cut fine, half a cup of diced turnip, and one-fourth cup of grated carrot. Salt and pepper to taste. Cover with boiling water and simmer till tender. Put the bones and trimmings into another saucepan, cover with cold water and let them simmer until the liquor is reduced one-half, then strain it and add the liquor to the ragout. When the meat is tender remove the fat, add a tablespoon of brown sauce and a teaspoon of Worcestershire sauce or two tablespoons of wine or half a cup of currant jelly.

Scotch Broth

Two pounds lamb, one and one-half quarts of water, two onions, one turnip, two tablespoons flour, four stalks of celery, one carrot, two tablespoons butter, salt.

Remove the meat from the bone and cut into small pieces. Tie the bones in a small bag and cook in the same water in which the meat is cooked. Cut the vegetables into small pieces, cook slowly in the stock for two hours. Rub the flour and butter together and add to them a little of the hot broth. Stir until smooth, then add to the broth.

Fricassee of Lamb

Cut two pounds of lean lamb into small cubes, dredge with flour and brown in a frying pan, using a little suet to keep it from burning. Place in kettle and add just water enough to cover. Boil for ten minutes and place in cooker for six hours. Thicken with one-half cupful of browned flour mixed with cold water, season to taste and serve on toast.

Lamb Croquettes

Four pounds of cold cooked lamb and two cupfuls of cooked rice (fresh boiled and still hot when mixed with the lamb), one teacupful of suet chopped fine; two sprigs of parsley, chopped, one nutmeg grated, an even tablespoon of onion, after it is chopped as fine as possible the juice and grated rind of one lemon, salt and black and red pepper to taste. Chop the meat very fine; mix all well toegther; add cream until it is quite moist, or just right for molding. Mold them in the form of pears; dip them into beaten egg and roll them in pounded cracker or bread crumbs; fry in boiling hot lard. A little stem of parsley may be stuck into each pear after it is cooked, to represent the stem.

Lamb Heart Smothered in Onions

Three lambs' hearts, bay leaf, two teaspoons salt, one-fourth, cup flour, three tablespoons drippings, one teaspoon celery salt, three cloves, one-eighth teaspoon pepper, water, eight medium sized onions.

Clean hearts thoroughly and cut crosswise in inch slices. Sprinkle with salt and pepper and roll in flour. Melt drippings, add onions sliced, and hearts, and brown. Add seasoning, rest of flour and boiling water to cover. Cover closely and simmer for one hour. Lift meat and onions carefully onto a hot platter, thicken gravy and pour over the meat. Keep meat half covered with water while it is cooking. Serve on rice border.

HABITS

By Mrs. D. C. Anderson

The old adage, "We are all creatures of habit," certainly is true with babies. Therefore do not start or allow things you do not expect to continue. I have twin girls 14 months old, nursed them until one year except one bottle each a day. Have had complete care since they were six weeks old. When one began to suck her thumb I let her do so, thinking I could break her later. It kept her quiet and I had my hands full. Now I have done everything to break the habit and still no success. She has acquired the appetite for bitter aloes, etc. Never again would I allow a child to suck its thumb.

If a breast fed baby has colic do not dope the child; be sure feet and bowels are very warm and take outdoor exercise yourself to prevent it again.

Be regular in feeding, sleep, nursery chair and bathing. It more than pays in time saved.

Do not start rocking baby; it takes valuable time and does no good. Any child is better off to be fed and put to bed than to be rocked to sleep. I put mine to bed at seven and they are asleep in a few minutes. I have a long evening to myself. If they cry in the night I get up, turn them over, straighten their bedding, and they are sleep before I can get back into bed. I never have a light for them after they are once tucked in.

I wish inquirer could see my 100 per cent babies with their brown eyes and rosy cheeks. I had them examined by the baby clinic at the state fair.

Wishing our Cultivator success in its baby column.

The poor flavor of common tea is made infinitely worse by the puckery taste of tannin—tannin, you know, is what they tan leather with.

Good tea costs more per pound but less per cup. So what's the use?

Schilling Tea is the fine practical economical tea of this country.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

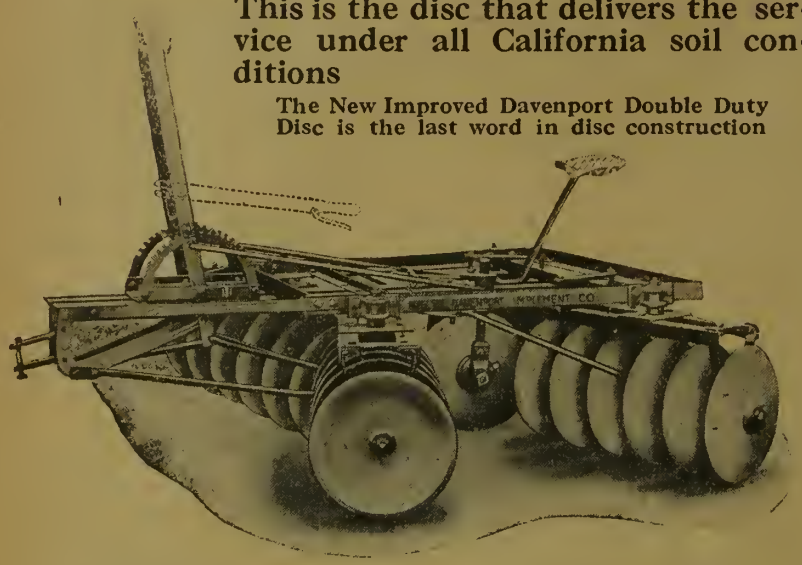
Spinach, lb., 2@3.

More Science: Less Draft---

MORE WORK IN LESS TIME

This is the disc that delivers the service under all California soil conditions

The New Improved Davenport Double Duty Disc is the last word in disc construction



If you are interested in Discs be sure to see the new Davenport Double Duty. It is built to deliver service under all conditions for every pound of weight and pull applied with NOTHING TO GET OUT OF ORDER. After setting the drop levers they STAY SET held RIGIDLY and POSITIVELY IN PLACE. No automatic features to break, slip or get out of order. The drop lever feature allows the levers to be laid down low and the seat is detachable permitting work under low hanging tree limbs. No implement you can use will conserve moisture that's in the ground like a Davenport Disc. Years of constructive effort and painstaking observations have enabled us to construct the Davenport Double Duty Disc so efficiently that it will do more work with less power and in less time than anything you can buy for the same money. Made in 6, 8 and 10 ft. sizes. Larger sizes made to order. A post card will bring an illustrated circular and price lists on any implement you may want.

Dayton Airless

PIERS of LIVE RUBBER take the place of a TUBE

Puncture Proof AND Easy Riding

Put Dayton Airless Tires on your car now and forget punctures, blowouts, pumps and patches. Seven years of service has proven their success and reliability. Over 100,000 are in use today. They don't bounce like a tight pneumatic nor d-r-a-g like a loose pneumatic. They are easy riding—and wear till there's nothing left but shreds.

Equip Your Ford

or any other car using 30x3 or 30x3½ sizes. No spare tire needed. Thousands in use on light delivery cars. Send coupon for booklet and prices.

Excellent Territory Open

We have a splendid proposition to offer to business men in every county where we have no agent. Mail the coupon for the facts.

SALCH-COPPEL CO.

1426 Market St. San Francisco, Calif.

This Tells the Story

I have used a set of Dayton Airless Tires, getting 44,000 miles out of the front and 20,000 miles out of the rear tires, the difference in mileage being due to my overloading my Ford Touring Car by hauling three barrels of oil constantly. I used the tires constantly, nearly three years, and Dayton Airless Tires make no difference in the wear and tear of a car. I find the engine and steering apparatus as good or better than the average car of like age.

And the satisfaction of knowing that when a person starts he can get somewhere without distress of both body and mind by punctures, blowouts, and loss of time is a compensation in this age of progress for any difference in price. The fact is, in the long run, the cost of Dayton Airless is about half the pneumatic cost.

HAROLD T. SMITH, Asst. Treas. HUMBLE & GULF COAST OIL COMPANY

THE MILKING PROBLEM

Getting all the milk from 300 cows twice every day is some job. The problem that confronted Manager E. H. Fox of the Fox Ranch at Oakley became seriously complicated during the past year, due to the high wages demanded by the milkers and the inability to secure adequate, reliable help at any price. Mr. Fox took a review of the situation and a survey of the mechanical milkers in the field. He knew it was the one answer to the labor problem. To make a long story short he installed a De Laval milker. It is a big installation, probably the largest individual outfit on the Pacific Coast, and covers every one of the 300 stalls in the big barn. An interesting catalog describing the new De Laval Milker can be obtained free of cost by writing to the offices of the De Laval Company, 61 Beale Street, San Francisco.

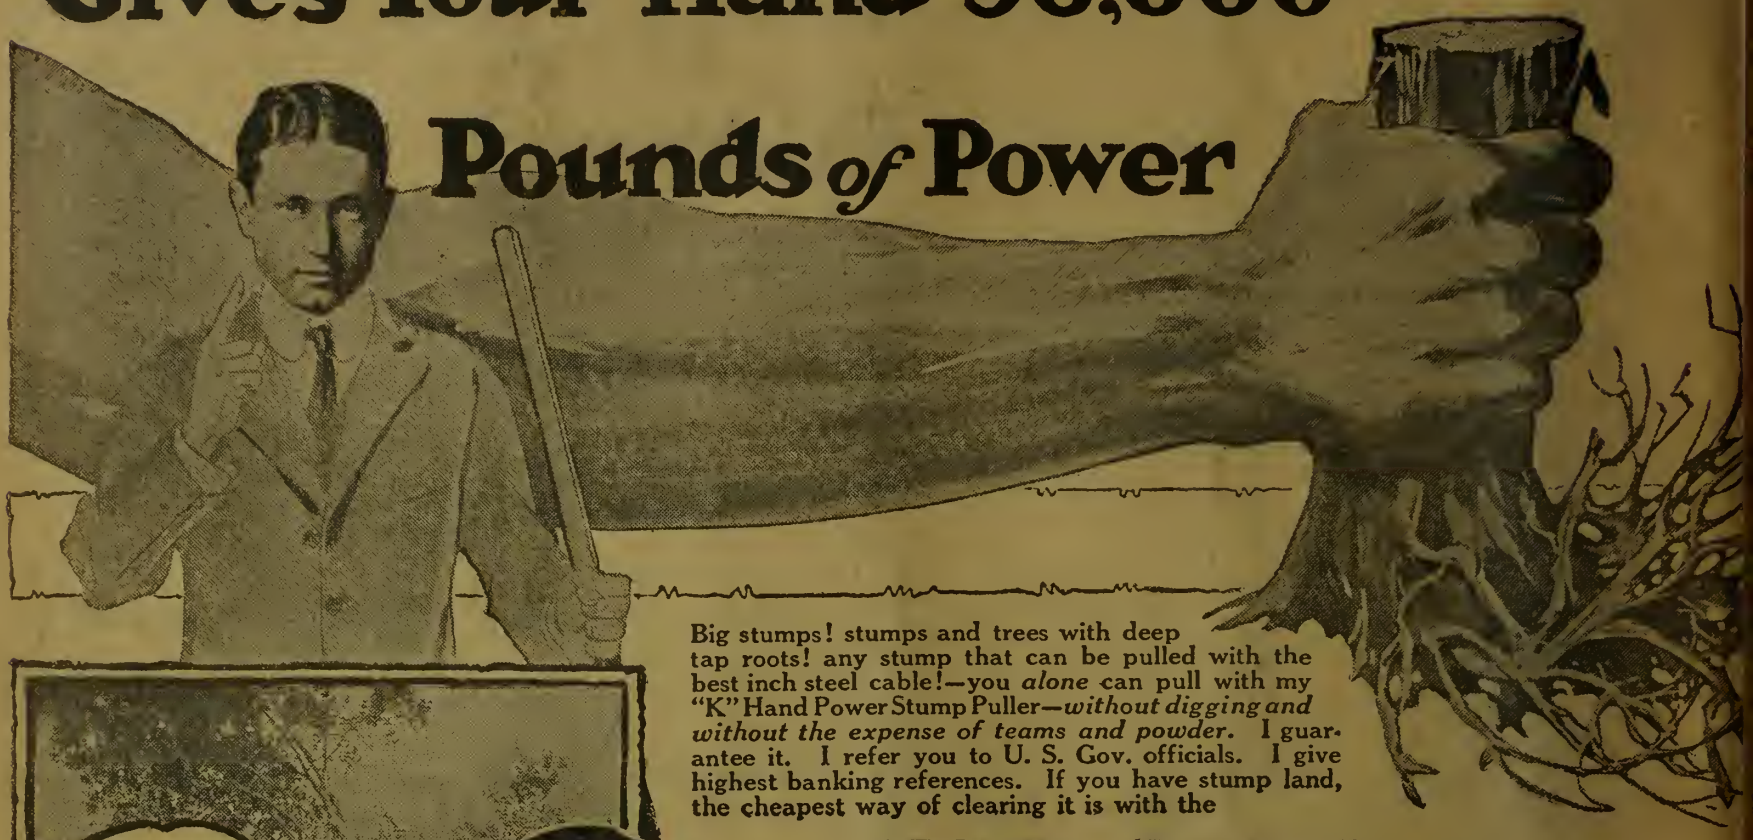
My K Hand Stump Puller

Gives Your Hand 96,000 Pounds of Power



Big stumps! stumps and trees with deep tap roots! any stump that can be pulled with the best inch steel cable!—you *alone* can pull with my "K" Hand Power Stump Puller—*without digging and without the expense of teams and powder.* I guarantee it. I refer you to U. S. Gov. officials. I give highest banking references. If you have stump land, the cheapest way of clearing it is with the

HAND POWER

K Stump Puller

Frank Hance, a *one-armed* farmer of Bowie, Md., pulling a double silver maple 3 ft. 8 in. in diameter at the ground, with deep tap roots. This is an easy pull for the "K," as the cable can be hitched high and the leverage is consequently greater.

How the "K" Pulls Biggest Stumps

The "K" works on the leverage principle of the ordinary lifting jack, except that the power is applied on a cog-wheel instead of a standard. 100 lbs. push on the lever develops a 48-ton pull on the stump—all an inch steel cable will hold. One man operates it alone—no teams to pay for—no walking.

A Mechanical Wonder

Made of finest steel—guaranteed against breakage. Weighs only 171 lbs.—easily carried or hauled about on its own truck wheels. Has two speeds—60 feet per minute for hauling in cable or for small stumps—slow speed for heavy pulls. *Works equally well on hillsides and marshes where horses can not* work.

Owners Praise It

H. Sinclair of the Dept. of the Interior, a U. S. Gov. official, writes: "The stump puller is a wonder."

Ernest Thompson Seton, author and naturalist, declares the "K" "a great success."

Hundreds of owners write in, telling of pulling six- and seven-foot stumps, of pulling faster and pulling bigger stumps than by any other machine.

Special Offer We are making a special offer to get a "K" Stump Puller introduced in every neighborhood. Write us today for full information and for free book on Land Clearing and about our Wonderful Drag Saw.

Collective Action---Productive Cooperation

THERE has existed for years in this country collective action by merchants, by industrialists, by laborers and others, which has resulted in great benefit to those interested. Productive cooperation has been slower of realization. That it is coming effectively is proven by "The Greatest Story Ever Told" on the cover of last week's California Cultivator. That story did not touch upon the fact that cooperation had made such a showing of California's production possible, but had it not been for cooperation it would have been many years before a productive industry of such magnitude could have been chronicled for this state. But productive cooperation is now here and growing with greater rapidity, we believe, than cooperation in any other industry.

Of course we can go back to the time of George Washington and Benamin Franklin and learn where those seers into the future realized the necessity of cooperation and urged it upon producers. In fact, from that time until within the memories of some of us there have been log rolling bees, barn and house raising bees and other cooperative activities which proved most beneficial within limited bounds. Cooperative town meetings in New England and similar united effort in some southern states should have proven of sufficient educational value to have brought about a closer cooperation, but it took generations to educate, and education is necessary where cooperative effort is to be undertaken. The difficulties in this line of work were realized some 3,000 years ago when the prophet asked in all seriousness: "Can two walk together except they be agreed?" But the cooperation of pioneer days in the log rollings and barn raisings was only undertaken because of absolute necessity, and perhaps it must be admitted that cooperation today is only undertaken because of necessity equally as great. However, it has required a far broader education to bring about modern day productive cooperation. In any case, so far as cooperative organizations have been formed in California it has been because of necessity to organize to preserve an industry.

Questions concerning cooperation are all remarkably well answered in a publication of the University of Illinois, written by John W. Lloyd. Mr. Lloyd spent some two years in California informing himself in the state of most advanced cooperative movements, and "Cooperative and Other Mehods of Marketing California Horticultural Products" is the result. In his introduction he says:

"The permanence of horticultural industries depends primarily upon the successful marketing of the products. Many individual horticultural enterprises have failed, not because of inability of the operators to produce the crops, but for lack of efficient marketing facilities. When individual efforts at marketing have failed, growers have been obliged either to give up their horticultural pursuits or to cooperate with their fellows in the marketing of their products. The greater the distance of the grower from his market, the more helpless he has been as an individual in attemping to solve his marketing problems. It is not surprising, therefore, that California growers have been leaders in the development of cooperative marketing organizations in America."

"Three methods of marketing California horticultural products may be noted: (1) outright sale to speculative buyers, (2) consignment upon a commission basis, and (3) sale through a growers cooperative marketing organization. Each of these methods has characterized certain periods in the marketing of the various California products. In the early eighties of the last century, California fruit was usually purchased outright from the growers by speculative buyers who shipped it to a few of the larger markets. California fruit in the eastern markets was then looked upon as a luxury to be indulged in only by the wealthy, and the limited shipments were sold at exorbitant prices. During this period, the buyers paid good prices to the growers, and at the same time made large profits for themselves. Within a few years, however, with increased production, the markets seemed to be easily oversupplied, and the former buyers refused to purchase fruit from the growers, but were willing to handle it upon a commission basis in addition to a fixed charge for packing. This arrangement relieved the shipper of all risk and assured him a profit, but placed the grower at the mercy of an uncertain market, and finally resulted in such low returns that the entire fruit industry of the state was threatened with ruin. The crisis was reached during the financial panic of 1893."

Mr. Lloyd then lays down certain cooperative principles which are determined from the methods and transactions of California associations formed for marketing almonds, apples, berries, cantaloupes, citrus fruits, dates, deciduous fresh fruits, peaches, prunes and apricots, raisins, and walnuts.

California cooperative methods are sufficiently successful to enlighten the world.

Oakland

OAKLAND OWNERS REPORT RETURNS OF FROM 18 TO 25 MILES PER GALLON OF GASOLINE AND FROM 8,000 TO 12,000 MILES ON TIRES

THIS OAKLAND SENSIBLE SIX FOUR DOOR SEDAN IS POWERED WITH THE FAMOUS 44-HORSEPOWER, OVERHEAD-VALVE OAKLAND ENGINE

OAKLAND
SENSIBLE SIX

THE present remarkable value of the Oakland Sensible Six four door Sedan as an investment is evidenced in every field in which this competent automobile serves. Day after day, under the most strenuous conditions of service, it is not only delivering performance of the most satisfactory character, but is delivering it at extremely reasonable cost. This pronounced reliability of mechanical action, this economical discharge of every duty it may encounter, in the Oakland Sensible Six Sedan is joined with the unusual comfort that only complete equipment and appointment can give. The way the Oakland performs, the careful provision made in every detail of chassis and body construction for prolonged and capable service, makes the relative worth of this car unrivaled in the present automobile market.

America's Champion Cotton Grower

By M. E. Bemis

SECOND only in interest to the best pumpkin at the fair, the champion steer, or the best ear of corn, is the man who has been able to produce them. To grow something better than his neighbor, or more to the acre, is the pardonable ambition of many a good farmer and the incentive that has been the means of increasing production since fairs were invented—or discovered. To produce $365 worth of cotton to the acre is an achievement that I believe qualifies the grower for the title of champion cotton grower of America, although there may have been, and doubtless are, many who have produced more pounds of lint to the acre.

Sometimes the big yields are more or less accidents, and so when I was given the name of John Walthall of Scottsdale, in the edge of the famed Salt River Valley of Arizona, as one of those who had produced in the season of 1918 more than a bale of cotton to the acre, I did not become over enthusiastic. Presuming that his might be some semi-experimental plot of a gentleman farmer who had money to hire help when help was needed or to fertilize if deemed wise or to do any of those many things that the ordinary root-hog-or-die farmer cannot do, I did not arouse to any particular degree of ecstasy except as one cannot help but feel the invigorating influence of the ozone that flows over the fields that have sprung up where was once the desert, as one goes out along the beautiful Central Arizona drive and along the edge of the big canal that carries the life giving water, on through orange groves and farms to the little village of Scottsdale, the winter home of Vice-President Marshall.

On the edge of this village is the 40 acre farm of John M. Walthall. The modest home looks as though it might have been designed by one who would fain perpetuate the old ancestral Alabama home with a combination of the California bungalow. In response to my knock he came to the door, and in half embarrassed, half jesting manner explained that as he was a bachelor and must of necessity attend to his own housework, I would find the house upset and out of order, but curiously enough none of this was apparent, and despite the fact that he does the greater part of his farm work himself, the house was in as neat and tidy a condition as any woman would care to have her house. The spacious living room was not unlike the den of any studious, thoughtful man. Books, magazines, pictures and trophies of the hunter were apparent everywhere.

The same neatness extended to the farmyard and farm. Then I asked about the big yield of cotton that I had heard of. "Well, you see," he said, "I came here, like so many others, for my health." To look at him now, the picture of health, strong and muscular, bronzed with the sun and air, it is hard to believe that his one thought a few years ago was to recover his health, pecuniary gain from his farming operations being a secondary consideration, but I took his word for it. Continuing he said:

"This place was in alfalfa when I bought it. It was in alfalfa for about six years. This particular field, which measures slightly less than seven acres, was plowed up three years ago and has grown a crop of grain in the winter and a crop of corn or grain sorghum each summer, making two crops each season. In December it was plowed eight inches deep and disked at once with a double cut-a-way disk. In February it was again disked, dragged down and leveled and ridged with a lister in ridges four feet apart. Then came the irrigating. By carefully manipulating the water it was made to flow through the furrows between the ridges slowly so that the soil would become thoroughly saturated. The water was allowed to run for several hours. When dry enough, the ridges were dragged down flat. The 25th of March the seed was planted, 25 pounds to the acre, the best Pima seed of course. Cultivation began as soon as the plants were up enough to be seen in the rows. A disk cultivator was used, throwing the earth toward the plants. The first irrigation was about four weeks after planting. After the first cultivation the plants were thinned to 24 inches apart in the row. Cultivation was frequent throughout the season as long as it was possible to get teams through between the rows. I irrigated as often and whenever the appearance of the plant seemed to show that it needed more moisture."

"But about the yield," I asked. "Oh, yes," he said, "on the seven acres, or to be exact, a little less, I picked 11 bales that averaged full 500 pounds each."

Cotton last year was worth 65 cents a pound for the lint. As there is approximately 1,300 pounds of seed for each 500 pounds of lint and as this was worth $63 per ton, the gross value of the field was $4,016, or a little over $365 per acre.

This year he has increased his acreage, but the yield will be slightly more than last year, even with the larger acreage. As cotton this year is selling for 80 to 86 cents for lint and $75 for seed, his gross income per acre will probably run over $400.

As evidence that he is not merely producing weight without regard to quality of fiber, it might be mentioned that Walthall's cotton at the International Soil Products Exposition held at Kansas City in September, 1919, was awarded sweepstakes for American Egyptian cotton. At the Arizona state fair in November, 1919, he was again awarded sweepstakes for the best display of "nearest perfect plant," "best five pounds of seed cotton," and "best five pounds of lint cotton."

Walthall's success is not an accident. It is not the achievement of a rich farmer with money to burn in making a name by breaking a record, but it is the work of a man who works with both his head and his hands.

Here in the Salt River Valley where Egyptian cotton has been grown more successfully than anywhere else outside of Egypt, there are two questions that have bothered the growers, and about which there is some dispute. One of these is the type of plant that is nearest to ideal, and the other is how to plant (that is, distance apart) and how to irrigate so as to produce such a plant.

On these points Walthall says: "It seems plausible that a plant that is crowded is not as healthy as one that grows naturally; that is why I plant in rows four feet apart and thin to 24 inches in the row. In this way there are no so-called 'vegetative' branches, but all of them bear fruit. Irrigation is an important matter. Plants should never be allowed to suffer after they begin fruiting."

The largest farms in the Salt River Valley of Arizona are owned by the Southwest Cotton Company. This concern has about 17,000 acres under cultivation on its two big plantations—one at Goodyear south of Chandler, and one at Litchfield, 15 miles west of Phoenix. Only about 8,000 acres of this land is in cotton. The balance is in alfalfa, milo or other grain sorghums and in grain. All the feed produced on these farms, with the exception of that needed for the feeding of horses and mules required on the farms, has been sold to Babbitt & Doyle, cattle and sheep owners, with extensive range and livestock interests in the northern part of the state. They plan to bring cattle and sheep from the range country to be fattened through the winter on the feed produced on these big farms. The feed produced will be supplemented by cotton seed meal and hulls produced from the oil mills of the company. Slaughter houses will be built on the plantation to supply the two towns on these farms.

The lettuce crop of the Salt River Valley of Arizona, it is now announced, will be larger than ever before. The acreage this season is 1,150. Of this 500 acres is near Glendale and 150 near Mesa, 100 acres near Phoenix and the balance scattered throughout the valley. It is expected that the shipment will amount to at least 525 carloads.

Agricultural News Notes of the Pacific Coast

Northern California

The Western Fruit Jobbers Association meets in San Francisco, February 2 to 6.

The Sacramento Northern Railroad is completing a $50,000 depot in Marysville.

Modoc County seed potatoes are highly recommended for early planting in Southern California.

A new asparagus cannery is being built on the Sacramento River at Isleton, Sacramento County.

At Stanford University stables $25,000 worth of blooded stock was burned to death on December 31.

Douglas County, Oregon, has a new industry in the shape of a farm of pure bred Swiss milch goats.

Antioch, Contra Costa County, will ship 1,000 carloads of vegetables this season, including 170 cars of celery.

San Francisco dealers report that potatoes arriving from northern states are frost bitten and require sorting.

A recent tree census in Butte County shows a triple increase in prune planting in 1919 over the year 1918.

San Francisco has purchased the Sutro properties near the famous Cliff House for park purposes; price $250,000.

The improved varieties of jujubes at the experiment gardens at Chico are attracting the attention of Butte County orchardists.

The new rice mill at Chico is completed, machinery installed and warehouse storage provided for 150,000 sacks of rough rice.

The Pacific Rice Growers Association have decided to build warehouses in the counties of Butte, Colusa, Glenn and Sutter.

The dairymen of Sonoma County met and organized during Christmas week, with 75 per cent of the dairies represented.

Paradise, Butte County, shipped in 1919: Apples, 14 cars; pears, three cars; berries, 20,000 pounds, and olives, 160,000 pounds.

A Colusa County rice grower has refused $8.10 a sack for 3,000 sacks of rice in a warehouse, a ten cent price being expected in two weeks.

Seventeen students in the Oregon agricultural college are taking a course in commercial canning and manufacture of jams and jellies.

In Alameda County farm home meetings will be held at Dublin, Castro Valley and Orchard Avenue on January 12, 13 and 14 respectively.

Vacaville, Solano County, last year grew 3,500 tons of prunes (dried) and will now plant enough new acreage to ensure a packing house at that point.

The Home Industry League of San Francisco has sent warning to olive growers organizations to issue publicity matter to combat eastern stories of olive poisoning.

The United States forest service has a new camping ground open to the public on the shores of Lake Tahoe and will continue improvements throughout the year.

An apple grower from the Wenatchee Valley, Washington, visited Tuolumne County last week and says the apples grown there are as good as any in Washington or Oregon.

Central California

Fresno will soon build a $250,000 Y. W. C. A. building.

A large acreage of rice will be planted about Delano, Kern County.

Stanislaus County leads the state in production of butter and cheese.

Lockeford, San Joaquin County, shipped 105 cars of grapes in 1919.

Tulare County's 1,000 acres of cotton averaged more than a bale to the acre.

The three Tulare creameries paid out last month for butter fat $195,492.34.

Fresno County shipped this season 9,000 tons of Muscat and Malaga layer raisins.

Salinas, Monterey County, is waging an official war on rats through a poison squad.

A Pasadena packer will build a $100,000 jam factory at Ceres, Stanislaus County.

It is announced at Fresno that the 1919 raisin crop of California will net the growers $33,000,000.

The Tehachapi district pear crop shipped from Bakersfield brought the growers about $100,000.

Lindsay has shipped 1,440 cars of navels, 60 per cent of the total navel output of Tulare County.

The first carload of oranges ever shipped from Oakdale, Stanislaus County, went East Christmas week.

In Fresno more than 20 tons of old automobile tires were collected for the tuberculosis fund of the Red Cross.

Modesto produced 5,000,000 pounds of the 7,846,342 pounds of butter produced by Stanislaus County in 1919.

The Merchants Association of Fresno gave 800 Christmas trees to that number of the poorer families of the city.

San Joaquin County farm bureau will hold 12 important meetings during January, covering all parts of the county.

San Francisco capitalists have purchased a 4,000 acre tract of land in Tulare County, including the townsite of Angiola.

The Stanislaus County farm bureau has set 1,625 as the number of members it must have at the close of the present drive.

Members of the Bakersfield boys pig club have purchased two pedigreed Poland China gilts, paying $150 and $300 for them.

The Karakul sheep imported from Asia Minor are said to exist almost entirely on alkali weeds in the San Joaquin Valley.

Nine thousand acres of Miller & Lux lands near Dos Palos, Merced County, is to be at once subdivided and placed on the market.

While the Porterville district of Tulare County has shipped its orange crop, the Success Valley, to the east, has not commenced picking.

The Salinas, Monterey County, farm bureau voted 29 to one for Japanese exclusion from use of land and unanimously against the daylight saving act.

The Fresno chamber of commerce has invited all tobacco growers holding their crops to meet at an early date, pool the output and secure an option for its delivery.

Southern California

San Diego is to have a permanent naval station.

Recent heavy rains have raised the Salton Sea six inches.

Bean straw is selling at Oxnard, Ventura County, for $20 a ton.

Alfalfa hay is bringing $33.33 a ton f. o. b. at Hemet and San Jacinto.

The Arlington cannery in Riverside County will at once double its capacity.

The Imperial Valley expects to market 650 carloads of spinach this winter.

The two original navel orange trees at Riverside are said to be slowly dying.

The National Orange Show at San Bernardino is to be held February 13-23.

The total acreage of sugar beets in the San Fernando Valley this year was 3,597.

Work has been started on a federal post office bilding at El Centro, Imperial County.

Unusually warm weather has started cantaloupe planting around Brawley, Imperial County.

The pea acreage of San Diego County is about 600 with a crop estimate of about 75 carloads.

In the Moreno Valley, Riverside County, there are 360 acres of olives and 210 acres of apricots.

Members of the Whittier Walnut Growers Association have received $800,000 for their 1919 crop.

The supervisors of San Diego and Imperial Counties will build a highway from Julian to Brawley.

The paved highway from Mecca in Riverside County to Brawley, Imperial County, is nearly completed.

The West Riverside cannery will double its present capacity and build 75 additional cottages for employes.

The San Bernardino County farm bureau is setting out 200,000 eucalptus east of Chino, to act as windbreaks.

The Old Baldy Citrus Association is the name of a late incorporation of growers at Upland, San Bernardino County.

Ranchers about Perris, Riverside County, have signed for more than 3,000 acres that will be planted to cotton next year.

The assessor states that there are 7,000 Japanese in Imperial County, controlling tens of thousands of acres, but owning less than 1,000.

Soil testing demonstrations by Professor J. W. Nelson of the state college of agriculture will be held in Orange County, January 13-16.

The Imperial Valley shipped 60,000 pounds of turkeys from November 1 to January 1, one-fourth less than last year's output for the same months.

Three kinds of cotton are grown in the south end of the state: short staple; Durango, or medium staple; and Pima Egyptian, or long staple.

Volcanic tufa, a very light weight rock found in San Bernardino County, will be mixed with cement and made into fence posts and railroad sleepers.

An eight months old pig of 409 pounds recently killed at the government station in the Coachella Valley was fattened on dates that dropped from the trees and it is claimed made a superior pork.

The Coast and General

A cannery for berries will be built at Juneau, Alaska.

Ninety acres of the 1919 Washington potato crop was passed as certified seed.

A new fruit and vegetable cannery is being erected in Port Angeles, Washington.

Southern Nevada will for the first time plant several hundred acres of long staple cotton in 1920.

Linn County, Oregon, the "pure bred livestock county" of the state, is organizing a breeders association.

Three hundred ninety cars of shook are on the way to Imperial Valley, according to Southern Pacific officials.

The Western Washington Horticultural Association will hold its annual meeting at Puyallup, January 28-30.

Salt River Valley, Arizona, marketed cantaloupes from 4,000 acres in 1919 and from but 1,175 acres in 1918.

The United States forest service offers for sale 70,000,000 feet of lumber in the Santiam forest reserve in Oregon.

Florida shipped its first carload of tomatoes December 4 and the crop promises to be much larger than that of 1918.

At Corvallis, Oregon, the agricultural college announces their best hen laid 330 eggs in 1919, and two others laid 323 each.

A new apple of merit has been put out in Spokane, Washington, known as the Ranier, a cross between Delicious and Nonesuch.

Manila, Philippine Islands, has a population of 283,613, of which 3,134 are Americans, exclusive of the army and navy men.

Unusually heavy snowfalls are reported in the mountains forming the Colorado River watershed, an indication of spring floods.

Ninety-four permits for appropriation of water for irrigation from Oregon's rivers were issued during October and November, 1919.

Seattle reports a bad freeze in the Northwest that has advanced prices on all vegetables, $5 a ton on potatoes and $1.50 a hundred on onions.

A bridge across the Colorado River 80 miles north of Kingman, Arizona, will be built to open now inaccessible territory the size of Connecticut.

Every red cedar tree (Juniperus Virginiana) in the Southeastern United States is to be destroyed to save the apple orchards from "cedar rust."

Fifty per cent of the storage potatoes held in the Chehalis, Washington, district for late shipment were frozen by the coldest weather since 1881.

The Colorado Farmers Congress recently endorsed the payment scale for sugar beets adopted by the growers organization; when sugar wholesales at $7 a hundred, beets shall be $10 a ton.

Early snows and heavy rains throughout the range country have brightened the prospects for spring feed and supplied an abundance of water. Water supplies in some parts of Arizona have opened up ranges that for lack of water had not been grazed and have made possible the extension of the ranges for the time being. Cattle for the most part are reported to be in excellent condition

Some Livestock Thoughts for 1920

By R. P. Royce

THE year just closed must be reckoned a year of great importance to the livestock industry of California. It is not too much to say that during 1919 more real progress was registered by the various breeds of pure bred livestock in this state than in any previous two or three years. As a matter of fact 1919 saw the industry get under way to a real start, and there is every reason to believe that the development will continue to keep pace with the actual needs of this state.

A Classy Bunch

Best group five steers exhibited by University of California at Chicago International.

The interest manifested in better livestock in this state follows closely the marked interest noted in other states, but an investigation of local conditions would seem to indicate an even greater fundamental need existing in California than will be found in many of the more advanced states.

California today is conceded to be the most promising livestock field in the United States, and at the same time we stand under the indictment of having about as poor quality of livestock in general, and the best in many ways, to he found in any state. Such a situation has never heen entirely and satisfactorily explained, hut the very fact that such a situation does exist furnishes the basis for the statement that this state has a brilliant future.

If granted that a basis does exist for high hopes for the livestock development in California, and there is ample evidence to support the contention. The hig thing is for hreeders and livestock producers in general to get and hold a proper, sound and practical conception of the real reasons for better livestock and order their operations accordingly.

Offhand, it may seem that the value of hetter livestock is too generally admitted to need further argument, hut a trip through the more important producing centers of this state will impress one with the fact that hundreds and thousands of men have not reached that point of acceptance of the fact that they can increase their profits by the use of better hreeding material. Hence we may be pardoned if it appears that what is to he said is old.

First of all the livestock industry is a primary business and conditions exist in California that of necessity assure that livestock will always hold an important place as a source of revenue. Much of the land in this state can never be economically employed except to carry livestock. Our growing population, with the several large centers of population that exist, furnishes an ever increasing market, and because of our geographical location it is of first importance that our sources of supply he developed as near the point of consumption as possihle, and therefore, regardless of the market fluctuations that may occur from time to time, livestock will be produced in proportion to the demand.

In general, the climatic and feed conditions found in this state are such that livestock of all kinds can perhaps he produced here more economically than elsewhere.

With natural conditions that make certain the livestock business, with a growing market which assures a continually increasing demand for animal products, the big problem that faces the livestock producer of this state (as well as others, but particularly here, because we are more backward) is to meet that demand in the most economical way possible. In other words, the producer's profits, regardless of price, will depend upon his production costs, and the cheaper his production costs, the greater his profits. It is too much to expect that there will be any marked deflation of land value or labor costs. Such being the case, the one way open to the producer is to plan to cheapen his costs hy producing a class of livestock that will make the most economical growth and production on the feed investment involved. Such a class of livestock can only be produced through the use of better blood, represented by the leading pure breds. There is no other way, and it is as certain as daylight and dark that each year will see more producers turn to better livestock.

At the dawn of 1920, with its prospects so bright, the interests of all will he hest served if first of all producers in general recognize the fact that pure bred livestock is practical and efficient and offers the shortest and surest cut to greater profits hy the avenue of cheaper production. Education is needed, and lots of it, and every agency, the college of agriculture, the press, the various organizations, and the estahlished breeders should dedicate themselves to carrying out every line of practical propaganda calculated to aid in the movement.

Producers need to he educated up to the point where they will be willing to pay liberal values for hetter hlood. By liheral values it is not meant that they should be guaged to the occasional sensational prices reported. As a matter of fact the records will show that the average values registered hy the leading breeds are in no way out of line with the existing level of values obtaining for all other commodities. Indeed, a study of pure hred livestock prices can not fail to impress one with the fact that today a dollar will huy more real value in a pure hred sire or female than ever hefore. There never was a time when one could enter the pure bred market to hetter advantage than now, and this is particularly true in California. With the year just closed when nearly every agricultural product, save livestock, sold at record hreaking prices, the dollars so ohtained can be made to purchase more value in livestock today than at any previous time. Grain money, hay money, fruit money will do extra service if invested in livestock of the right kind.

As the breeding interests face a new year which promises much, it may be well to suggest to those who have not been long identified with the industry that as breeders they have certain responsibilities to the public and their breed. First, they should recognize the fact that the pure bred livestock industry is anchored on a solid foundation and that the general extension of the industry will be certain. They should not, however, regard the business of producing pure bred livestock as a quick and easy means to wealth. No man ever took from the business more than he put in unless he hrought to the industry talent, thought, courage, intelligence and a determination to stick to it. One cannot jump in and jump out without losing something. It takes time to become established; it takes time to gain the confidence of the public; and it takes a lot of downright hard work to succeed.

Established hreeders, heginners and those who plan to enter the industry can be certain of building a profitable and satisfactory business to just the extent that they give value received.

Young breeders, while fixing their sights on the high points, should he content wtih conservative values for their productions, and their entire operations should be hased on conservative returns, rather than the occasional sensational figures.

The most common sources of disappointment in this business are failure to succeed quickly, inability to measure one's own productions hy the same standard applied to fellow breeders, inahility to feed properly, and the false conception of the entire business, based on the supposition that the business is "a game" for the speculator.

If breeders will only catch the sound viewpoint, see the wide field ahead of them that affords a market for all the meritorious stock they can produce, be satisfied with reasonahle prices, learn how to feed and develop, enter the business with a mind made up to stay with it, keep their business and their breed free from speculation, conduct their transactions on a high, clean, dignified basis, cooperate with each other, and encourage and help beginners, then will they do their part toward putting California livestock before the nation as it should be. Let our livestock interests profit hy the mistakes of the older sections—and 1920 will record a year of satisfactory progress, built on a foundation of permanency that will mean much in all years to come.

Best Pen of Five College Wethers at Chicago International
Exhibited by University Farm, Davis.

Wherever labor can be saved on the farm and results accomplished just as satisfactorily, by all means save the lahor. Results of experiments at the University of Missouri college of agriculture with self feeders for fattening hogs show that those eating from a self feeder gain more rapidly than those depending on the hand feeding methods. The amount of feed necessary to produce a pound of pork remains practically the same, hut the amount of labor is usually reduced. It is this decrease in lahor which enters as a factor in cheapening the cost of producing pork.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

CALIFORNIA LEADS

America prides itself on its genius for organization. Its industrial accomplishments have been vastly greater than could have been possible had not this organization been permitted. In productive fields we have been much slower to gather ourselves together. California is leading the way.

HEAVY PRUNING

The department of agriculture has been making investigation of citrus pruning methods in California and reports that clear cut demonstration is made that heavy pruning is detrimental to the citrus trees. This is especially true of trees which have been propagated from those having high yielding records—that is, they require much less pruning than do trees of low producing habit.

CATALOGS

Nursery and seed catalogs are now coming out, and they have their usual winning way which creates a desire to make a garden and plant everything listed. They are about the most optimistic publications on the face of the earth, and we are glad they are. They contain a fund of information and inspiration to grow things which aid the housewife in many a meal and save the food administrator on the farm many a penny. Write for the sced catalog, for the garden should have a place on every well regulated farm.

STANISLAUS STILL LEADS

The report of the department of agriculture as to butter production during the year ending September 30 shows that Stanislaus is still the banner dairy county of the state. She produced over 8,000,000 pounds during 1918, for the past year dropped slightly but produced 7,846,382 pounds. Her closest competitor is Humboldt County with nearly 6,000,000 pounds. Imperial is a close third with 5,196,000. Other strong dairy counties are Fresno, Kings, Marin, Merced, San Luis Obispo, Sonoma and Tulare.

TRADE WHERE YOU LIVE

How about your own town? Is it a live one? If so, are you a factor in its being thoroughly up to date? As one hint, do you trade at home?

A farm near a live commercial community has greater value, finds better markets for its produce, and has better social and educational advantages for its young people than does a farm near a dead town.

Be a patriot, be a true Californian, be loyal to your community.

PUT OUT THE FIRE

In Idaho and Montana alone timber worth $3,500,000 was destroyed by fire last summer. California and every other section suffered greatly from forest, field and building fires. No country in the world is as wasteful as the United States in permitting ravages of fire. The best way of preventing these awful losses is by putting out the fire before it starts. It is possible some great uplift or benefit may be shown because of the cigarette, but, be that as it may, when it is carelessly thrown it becomes a menace to public welfare. Then the lighted match, the camp fire and carelessness with firearms causes many a serious loss. A little precaution may aid in saving millions.

MORE ROADS

By July, 1920 the department of agriculture has estimated that there will be in this country at least one billion dollars available for road construction, to be used during the following fiscal year. Of this amount the federal government alone has appropriated $680,000,000. Various states have authorized a total of $224,800,000, and these and other states have under consideration other proposals for $314,000,000 additional. The 12 months exenditure is expected to be at least four times greater than any preceding year. About the only limit on the year's accomplishment appears to be the securing of sufficient rail transportation for materials and the adequacy of constructive organization and supply of labor.

OLD CLOTHES

We may become members of old clothes clubs and in order to beat the profiteer and help in subduing the H. C. of L. wear our clothes until they show the threads and until the trousers are frayed about the shoe tops and until last year's bonnet becomes the talk of the spendthrifts, but we all refuse to wear rubber collars. But why not? The linen collar trust has hit us as hard as any, and the manufacturer claims that rubber collars are simply linen covered with pyroxylin instead of starch.

But why not go without either? It's a whole lot more comfortable. John P. Irish has gone through life without a tie, and he is proving fairly long lived.

BIGGER AND BETTER MEN

We sometimes become restive over sanitation requirements or regulations where great masses of people are gathered together. But should we? Isn't there reason for giving as great care to conditions surrounding men and women as to conditions surrounding our livestock? We recently noted:

"The size and strength of men and women are about the same, but our cattle are steadily becoming larger, our horses stronger, our chickens handsomer and more productive of eggs. And the advance is not due to natural evolution but to artificial aids to nature."

Perhaps our immediate surroundings may be made comfortable and such that we humans have at least an equal show with our livestock in developing the best that is in us physically.

TONS OF SEED

We have told of the wonderful production of some of California's staples, and it was indeed a great story. But there are thousands of tons of products sent over the Rockies from California, products that are out of the ordinary. For example, an item recently appearing in the publications of the United States department of agriculture calls attention to a shipment of 60 tons of sesbania seed produced in the Coachella Valley of California.

In 1904 this plant was growing by the roadside as a weed, but an investigation by the United States department of agriculture revealed its big possibilities because of its leguminous character. Since that year it has been widely cultivated, a principal use being for planting by onion growers immediately after the harvesting of onions in the late spring, thus enriching the soil preparatory to planting in the fall.

WS. S.

We do not see the magic initials so much as during the war. However, the war loan organization is being maintained and war savings stamps are still being sold, and it is asserted that the war savings stamp habit is to be encouraged for all time to come. At one time the savings bank people looked with som disfavor on the plan, that is, after the war should be over and no war need pressing, but it is now asserted that savings accounts are even increasing by savings which have been started in thrift and savings stamps because of the habits which these little slips of paper have encouraged.

During the year 1919 about $24,000,000 worth of these stamps were sold. The leading Pacific Coast state in per capita purchase of stamps is Oregon, according to report of the 12th federal reserve district organization. Oregon stands fifth among all the states of the Union in this regard. Ohio is first, with a per capita investment of $3.20.

PEDIGREED TREES

While it is not strictly correct to refer to the bud selection movement as a means of securing "pedigreed" stock, yet that term perhaps comes closest to expressing what we mean in referring to the action now being taken by the nurserymen of California. At the recent convention at Chico, the state organization, following suggestions which had been made by Mr. Kirkman at former conventions, discussed seriously a step which will, we believe, mean much to the California fruit industry. They not only discussed and passed resolutions, but took definite action in the appointing of live committeemen, and later in meeting in San Francisco and perfecting an organization. The new organization is a corporate body; it is proceeding to purchase lands which will be used to produce and to supply to nurserymen dependable buds and stocks. It may be that the time will come when the term "pedigreed" will be used—and correctly so. The new organization proposes to select buds only from trees of known productivity and to have them selected by men thoroughly qualified and of known integrity. Ultimately "pedigreed" trees and buds may become a factor of great importance to the California fruit industry. The importance of this step is fully recognized by the orchardist who has purchased trees, sometimes not true to name, possibly true to name but of a type that refuses to produce in large quantity fruit of highest quality. While it is possible that 100 per cent production may not be secured in our nursery stock there is no reason why this stock may not for all practical purposes be absolutely dependable.

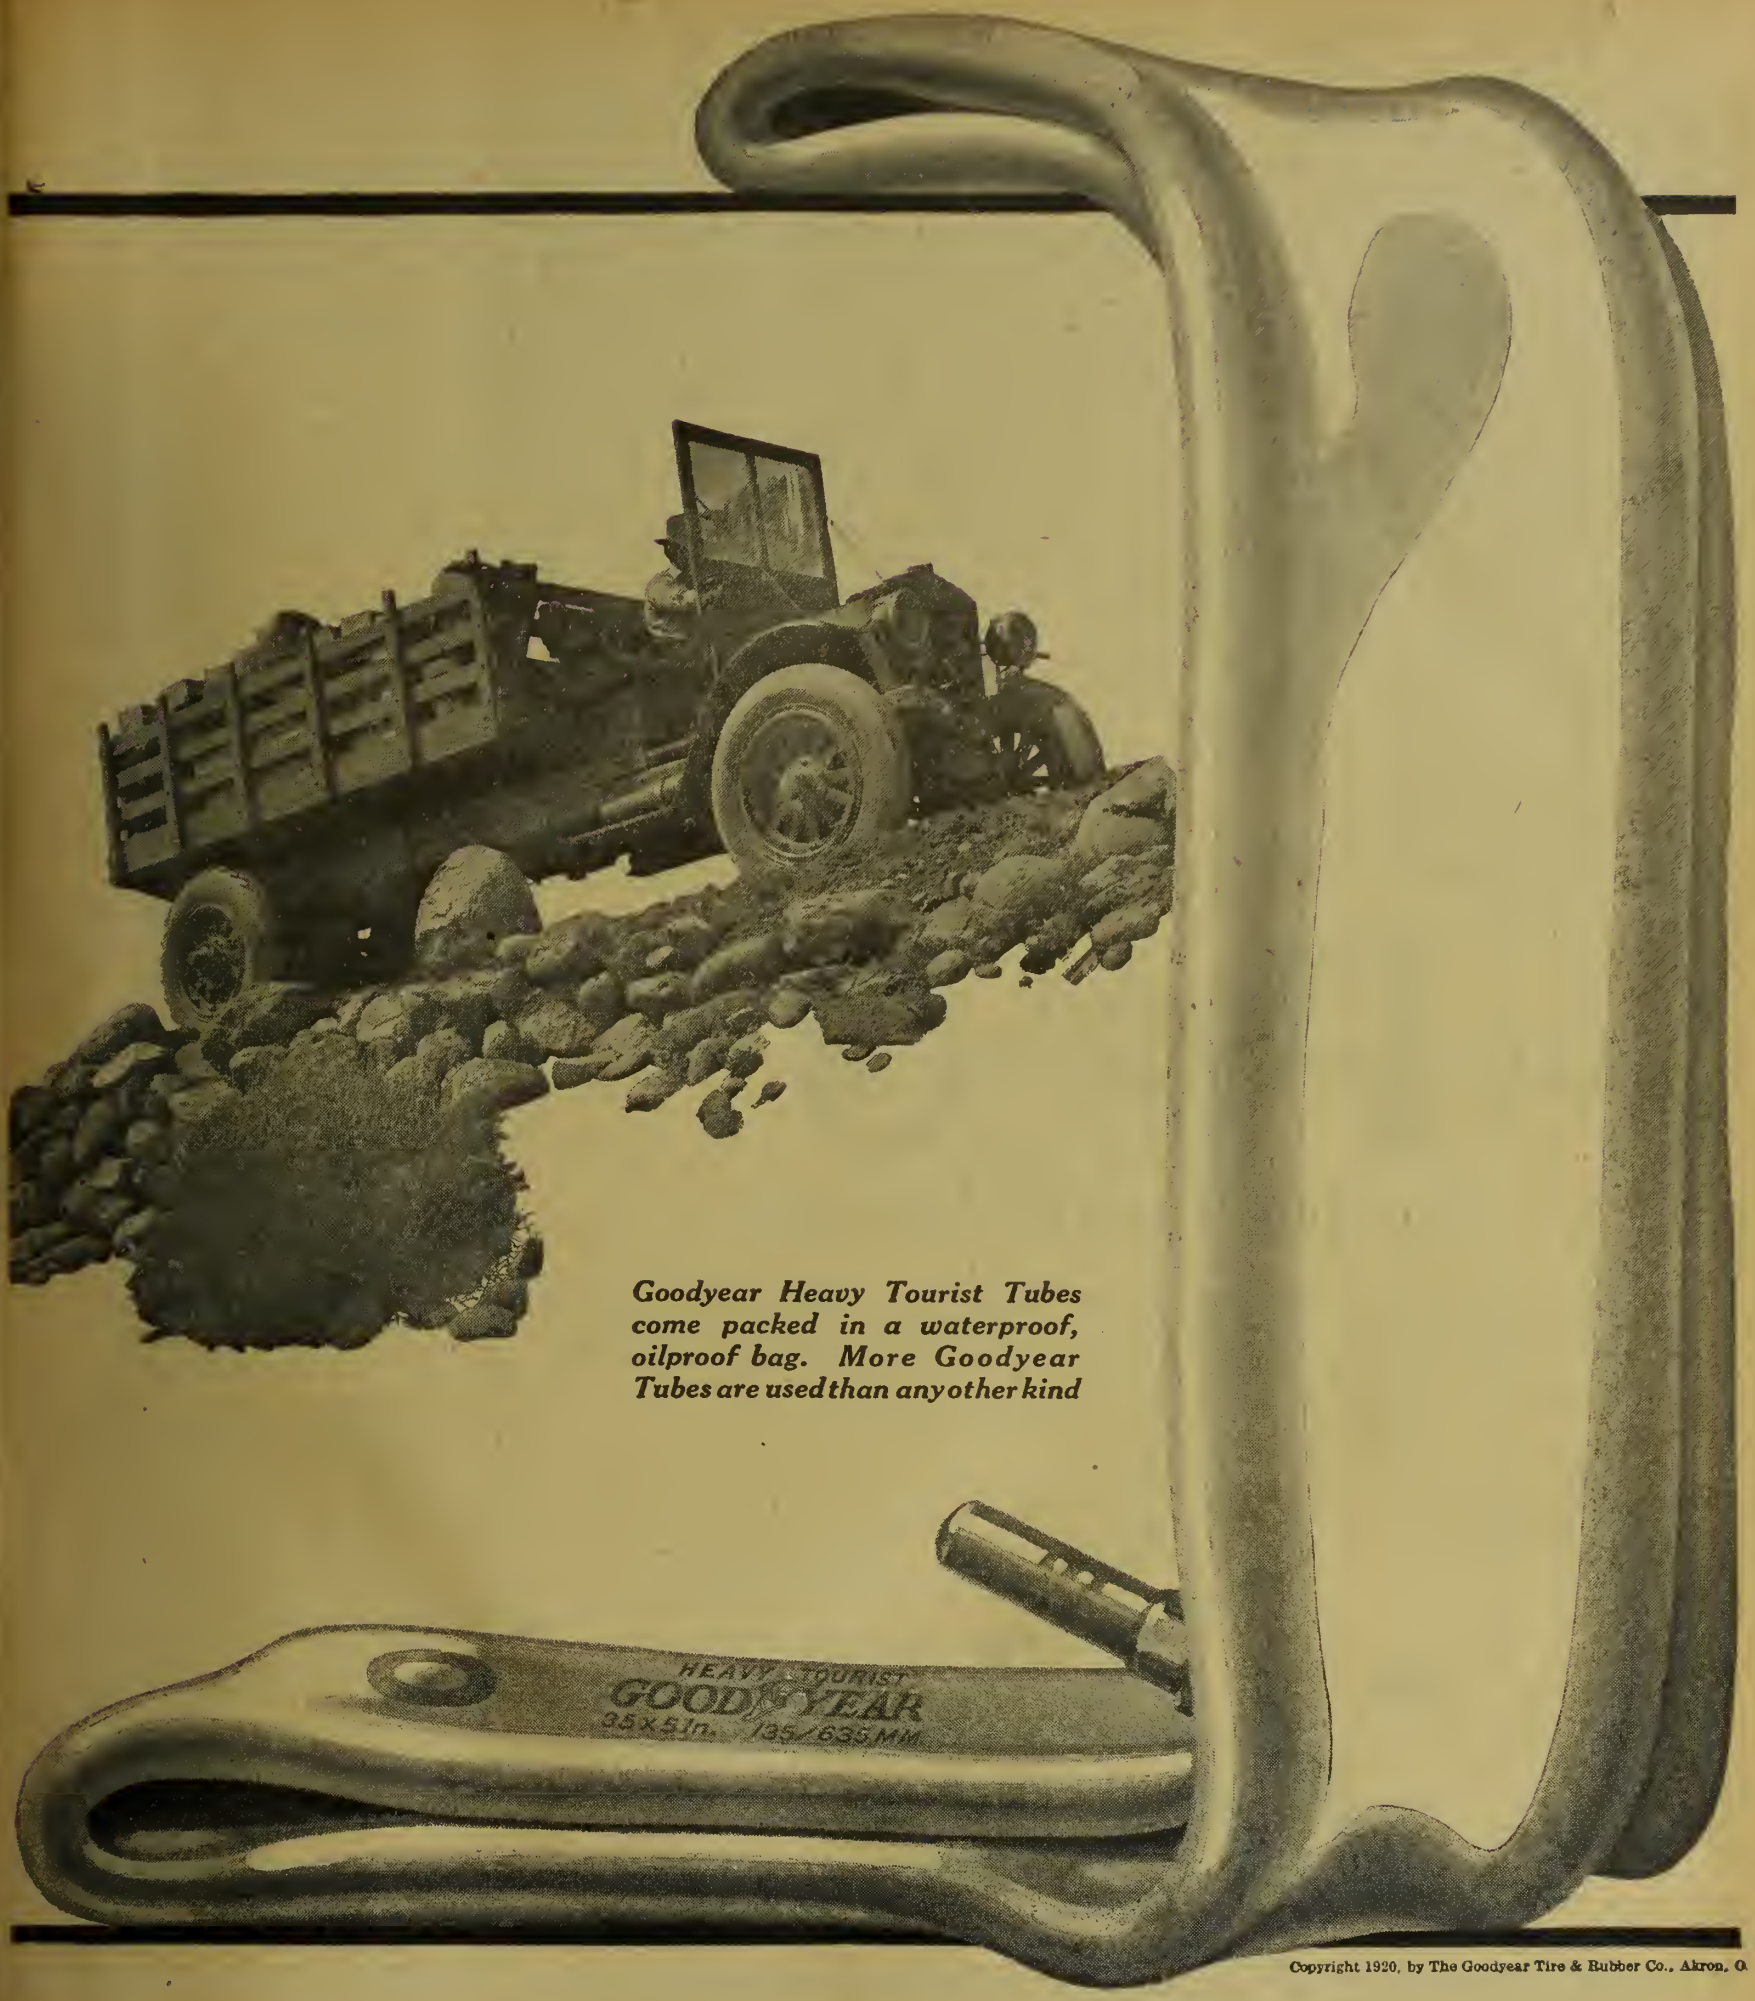
California's nursery interests are greater than those of any other state, and it is entirely fitting that the pioneering of such an organization should find its birth in this state. All honor to the directors and all the nurserymen who are joining in getting this organization into working trim.

WE ARE CENSUSED

The fourteenth decennial census is requiring 90,000 enumerators and clerks, and the enumeration is to be done in about two weeks. The first census, taken in 1790 under the administration of George Washintgon, required 650 people only and they were some 18 months in completing their work. That census had to do simply with counting the number of people in the United States. The census is taken every ten years and is required by the constitution of the United States. The number of representatives in congress is determined by the census. It is to be presumed that the number will be greatly increased because of the 1920 census, but owing to the great number of representatives, at present 431, an effort will be made to make the representation on a greater population basis. Th first census in which agricultural statistics were gathered was the sixth, taken in 1840. The last decennial census showed that the number of farms in the United States was 6,361,502 and that their valuation exceeded 40 billions. It is expected that the present census will show more than 7,000,000 farms. One new feature will be a gathering of statistics as to forestry and forest products. The department of agriculture aids in preparation of the list of questions and makes extended use of the facts gathered.

The bureau of the census is a part of the department of commerce which was established in 1902. Prior to that time the census work was done by a temporary organization known as the census office. At the beginning the enumeration was made by United States marshals and their deputies.

Of greatest aid in classifying and bringing the mass of material together and making it available to the people are ingenious machines which have been made especially for census work. These machines are almost human in their power, perhaps, more correctly superhuman, in that they are absolutely accurate in their conclusions. Within three months the department expects to be able to give final figures as to population.



Goodyear Heavy Tourist Tubes come packed in a waterproof, oilproof bag. More Goodyear Tubes are used than any other kind

Copyright 1920, by The Goodyear Tire & Rubber Co., Akron, O.

Three Goodyear tubes traveled on their original air all the way from Boston to San Francisco with the Goodyear Transcontinental Motor Express. What tribute to their reliability and staunchness! Goodyear Heavy Tourist Tubes for passenger cars, like the larger tubes for trucks, are made of pure gum strips, *built up layer-upon-layer*. They cost but little more (an average of sixty cents) than tubes of less merit. Surely it is false economy to risk, for so small a sum, a costly casing.

GOODYEAR

Better Nursery Trees

THE nursery and seed trade of California has drawn to itself a remarkably high class and efficient personnel. No other state excels in this line of work. In no other state does the industry reach the magnitude it has in California, and the efficient and educated care devoted to it is responsible in large part for the quality of fruit and the quantity of fruit sent from this greatest of all fruit states.

We feel justified in making this statement, first, because it is true, and, second, because an occasional mistake, such as is possible at all times in all businesses, sometimes gives an orchardist opportunity to call attention to the fact that he has purchased trees which have not all proved true to name. But when one considers the millions of trees and vines which have been the output of California's nurseries, the proportion of mistakes shown is remarkably low. The nurseryman handling his millions of individual plants and trees is confronted by a great difficulty in securing competent and sufficient labor.

Now he is taking another step to safeguard his interests and those of the tree planter. He has joined himself to other nurserymen of the state; lands are to be purchased and these lands used in producing carefully selected foundation stocks for the future orchards of California. It is a long step and will take some years to bring into fullest usefulness. However, the organization is proceeding rapidly, and some of the enthusiastic members are giving of their valuable time in the very busiest of seasons to complete its working force as soon as possible. We have asked one of the most enthusiastic members, J. E. Bergtholdt, vice-president of the new organization, for a statement as to the hopes of the organizers. Mr. Bergtholdt says:

"It has long been realized by those interested in horticulture that an organized effort should be made towards the elimination of undesirable sorts and undesirable types of common fruit varieties, and, most important of all, towards the selection by observation and experimentation of the best types of the standard commercial fruit varieties and the adoption only of those new varieties offered by propagation which have merit. No factor has entered so largely into the success of dairying, poultry farming, stock raising and cereal farming in recent years as the intelligent practice of these principles.

"Yet, in California we have had an industry that in recent years has been productive of many times more wealth annually than the production of gold during the years that the fame of California became world-wide for its production of the precious metal, and during all these years the California fruit grower has wasted an enormous amount of labor and capital in the cultivation of undesirable and second rate fruit varieties and of poor types even of the best standard commercial varieties without any scientific effort towards a selection of the best.

"The tree you plant is the most vital factor in your success as an orchardist. And the fact that fruit growing in California has been so profitable was due in large part to the favorable natural surroundings and climatic conditions of the Pacific slope.

"Many millions have been lost and many millions could have been added to the wealth of California if an organization had been fostered whose energies would have been directed towards carrying out this principle of elimination and selection."

The formal organization was perfected in San Francisco December 20. It has the heartiest approval of Wm. T. Kirkman, Jr., of Fresno. In fact, Mr. Kirkman has for several years urged some such organization as is now perfected. It is to be known as the Nurserymen's Bud Selection Association of California and has been incorporated with a capital stock of $150,000. The active direction of the association is vested with the following directors: President, Wm. T. Kirkman, Jr., Fresno; vice-president, J. E. Bergtholdt, Newcastle; H. A. Hyde, Watsonville; J. S. Armstrong, Ontario; J. W. Barnicott, Newcastle; Geo. C. Roeding, Fresno. Max J. Crow of Gilroy is secretary and treasurer.

"It will be the object of the directors to engage the best experts to manage and superintend the machinery that will be created towards carrying on this enormously important work of the association. The intensive efforts of this expert machinery will be directed toward selecting for propagation by observation and experimentation only the best types of the standard commercial fruit varieties; to discard and eliminate unprofitable sorts and inferior types.

"A permanent experimental orchard and bud wood farm will be immediately established. Every effort will be made to cooperate, not alone with the federal, state and university horticultural authorities, but to cooperate with the expert knowledge and experience of every branch of the commercial fruit growing and fruit marketing industry.

"Every nurseryman participating in the benefits of this organization has pledged himself not to employ for propagation any bud wood or scions excepting such as bear the seal and approval of this bud selection organization and has pledged himself not to offer for sale any tree that has not been propagated from buds or scions furnished by the association. By this means only will the planter be given absolute assurance and an absolute safeguard that the trees offered to him have been propagated from parent trees scientifically selected for the purpose by the experts not alone of the association, but of the best horticultural talent of the state.

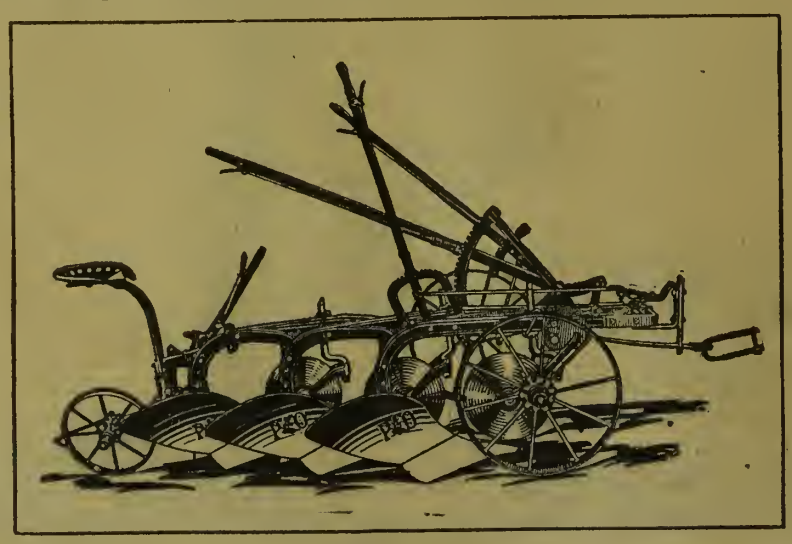
"The object of this association is to deliver to the planter of California the highest type of fruit tree that horticultural science can produce. The doors of this organization are wide open to every legitimate nurseryman within the state of California to become a shareholder and to participate in its benefits. The nurserymen have set out to make California produce the best fruit that can be grown."

1842 P&O 1920

Light-Draft Plows

EVERY detail in the construction of the P&O Line of Light-Draft Plows is worked out on the lines laid down by the founders — making for Simplicity and Strength. The popularity of these famous plows shows that the policy of the founders was right — they "knew how."

Used by Three Generations of American Farmers



78 Years of "Knowing How" Hammered into Every One of Them

P&O Light-Draft Plows cover a wide range of work, not only for all ordinary plowing, but for the unusual and the extraordinary. *For Horses:* Walking, Sulky and Gang, both moldboard and disk, in all standard sizes and models of bottoms. *For Tractors:* From 2 to 6 bottoms, both moldboard and disk. *Special:* For grading, ditching, hillsides, root ground, cut-over timber land, orchards, etc. There is a P&O plow for any section, and for any condition of soil.

Whether you own or operate a horse-plow farm or a tractor-plow farm, get a P&O Light-Draft Plow, and be a satisfied plowman.

Write for P&O Plow Catalog, or call on the nearest International dealer. Tell us your plowing problems — we believe we can help you.

NITROGEN AND NITRATE OF SODA

By R. R. Snowden

IT IS conceded that, considered from all angles, nitrogen is the most important of the plant food elements. In the arid and semi-arid regions much dependence for it is placed on the cover crops. Though nitrogen may in that way be added to the soil, the cover crop is, even disregarding this, of first consideration, because so decidedly contributive to the efficiency of all the plant foods. But regarded as a source of nitrogen I wish to point out that it is in practice found irregular and for this reason not altogether reliable.

For instance, in a practically uniform soil receiving identical treatment in every way, including cover crop, the nitrogen content varied from .019 per cent to .069 per cent.

In my practice, even with large nitrogen content, I have found it quite necessary to supplement the soil supply with early applications of immediately available nitrogen, and nothing has been found to equal nitrate of soda for this purpose; for the plants and trees are in need of this element earlier in the season than the soil bacteria are able to work actively in making the soil supply available; and further, because of the fact that before the soil is warmed the rootlets are not so active in absorbing plant foods as they become later.

While valuable because of its immediate availability and its being the cheapest source of nitrogen, nitrate of soda has a number of other characters which recommend its use.

In the process of absorption there is less loss of nitrogen than in any other commercial source. Voorhees in America and Wagner in Germany have found quite independently of each other that the following losses occur with nitrogen from different sources: Nitrogen from blood, 60 per cent; nitrogen from ammonia salts, 56 per cent; while but 38 per cent of that from nitrate of soda is lost. The above figures considered in connection with the cost of nitrogen from the several sources show that the nitrogen

actually used by plants costs one and three-sevenths times as much in ammonia salts, and nearly two and one-half times as much in blood as in nitrate of soda.

While potash is so high priced it is important to farmers that nitrate of soda is active in releasing the native potash of the soil and making it available for plant use. This action of nitrate of soda is especially useful to the farmers of California where many of the soils contain sufficient potash to last for years to come.

The writer proved experimentally in the laboratory that this action does take place, but the practical proof of it is given by A. D. Hall of the Rothamsted experiment station. Mr. Hall writes, "Fertilizers and Manures":

"As a manure nitrate of soda is of course treated as a source of nitrogen. It is not sufficiently realized how valuable the soda may be. This is not because the soda is necessary to the nutrition of the plant, but because of the action of any soluble salt upon the insoluble potash compounds of the soil. The potash in the soil is due to the weathering of various double silicates. Any soluble salt, and particularly a soluble soda salt, will react with these silicates, bringing potash into solution. To such an extent does this action take place that in practice a dressing of nitrate of soda on any but the lightest soils will dispense with the necessity of a specific potash manuring even for potash loving crops."

Writing of the effect of nitrate of soda in experiments with mangolds over a series of 25 years, Mr. Hall says that the plots receiving potash all gave the same yield, whatever the source of the nitrogen, but on plots without potash the yield is only maintained on the plot receiving nitrate of soda. Those plots receiving nitrogen in other forms declined in yield to less than half of the yield from the plot receiving nitrate. For 25 years theu the use of nitrate of soda alone has enabled the soil to supply mangold crop with the large amount of potash it wants, though the store of potash in the soil apparently soon becomes exhausted when a fertilizer is used which cannot bring it into solution.

The newer agriculture recognizes that for plant use solutions must be balanced; that is, contain the various elements in certain relative proportions. In this connection it is discovered tbat where there is a deficiency of soda and not of potash soda must be added in order to protect the plants from potash.

It is a fact that for every one and one-half pounds of potash so made available one pound of soda is locked up in silicate combination. So that this soda, practically taken from the soil, and that which is needed to balance the solution against the potash put into solution will usually account for the soda added in nitrate of soda.

A marked property of nitrate of soda is that of increasing the efficiency of soil moisture. In dry years under its influence profitable crops have been produced, while on the adjoining lands receiving no nitrate, the crops were complete failures.

By increasing capillary action and aiding oxidation processes in the deeper soil layers it encourages deep rooting to a marked extent.

The United States department of argiculture has made an exhaustive investigation of the relative efficiency of fertilizer materials and published the results of 186 experiments with their conclusions as Bulletin No. 48 of the bureau of soils, under the title, "Fertility of Soils as Affected by Manures." On Page 46 of this bulletin will be found their first conclusion, which I quote: "In comparing the relative efficiency of the fertilizer ingredients, it is found that in the vast majority of instances nitrate of soda ranks first." Thus we have a thoroughly competent and disinterested testimony to the superiority of nitrate of soda over other fertilizers.

In so many ways does nitrate of soda exert a beneficial effect that it rarely fails to increase production, and frequently greatly promotes it. For instance, at Woburg, England, it was found that in 1899 where minerals alone were used the wheat crop was 9.8 bushels, but where nitrate of soda was also used the crop jumped to 41 bushels per acre. And also in 1900 nitrate of soda raised the crop from 5.9, 6.8 and 16.2 bushels to 27.7 bushels per acre. But to bring the matter

Illustration shows Case 10-18 Kerosene Tractor pulling 2-bottom Grand Detour Plow.

To avoid confusion, the J. I. CASE THRESHING MACHINE COMPANY desires to have it known that it is not now and never has been interested in, or in any way connected or affiliated with, the J. I. Case Plow Works, or the Wallis Tractor Company, or the J. I. Case Plow Works Co.

Look for the EAGLE
Our Trade Mark

Below: Showing the Main Frame of the CASE 10-18 Tractor, cast in a single piece. Holes for bearings on each side of frame are bored in one operation by a special machine of remarkable accuracy.

CASE-The Tractor with Strength that Backs its Power

One of the outstanding features of superiority of the Case 10-18 Tractor is the rugged strength of its construction.

Now, bear in mind the difference between *Strength* and *Power*.

When you think of the Tractor you have, or the Tractor you ought to have, you probably consider it in terms of power.

Right!—as far as it goes. The proper proportion of power to work is an absolute essential to economy and efficiency of Tractor operation. But tractor Strength, as embodied in the Case is the factor that stands between you and repair bills and the more serious losses due to breakage or delays.

For instance, the frame of the Case 10-18 Tractor is cast in a single piece. In this one casting are fitted the bearings for transmission, rear axle and motor. Obviously, bearings, shafting and gears cannot get out of line. Once in place, they are in correct alignment throughout the life of the tractor.

Other Features of the CASE 10-18 Kerosene Tractor

Four cylinder motor, mounted crosswise. Eliminates bevel gears, chain or worm drive.

Simple and accessible clutch, pulley mounted on crank shaft,—where it belongs. It is on the same side with the steering gears making it easy to line up with belt driven machinery.

Automatic control of motor temperature assures fuel economy.

Cut steel gears running in oil and dust-proof throughout.

Hyatt Roller Bearings.

Worm-driven fan with friction safety clutch.

Two speeds: 2¼ and 3½ miles per hour.

The Case 10-18 Tractor will most economically handle such work as operating a 2-bottom plow (as illustrated); 22 shoe grain drill; two 6 ft. binders; 8 ft. double-action disc harrow; the largest manure spreader; Case 20 x 28 thresher with feeder and wind stacker; feed mill, or any other machinery of similar power requirement. Write for booklet illustrating complete details of Case 10-18 construction. It will acquaint you with the special advantages of the Case 10-18 and enable you to judge all tractors with a new understanding. Free, on request,—a post card will bring it.

TEAGUE'S
QUALITY
Citrus and Sub-Tropical
Fruit Trees

Are the best for Home or Commercial Planting

Teague's Citrus Trees

Are known throughout the Citrus Growing Sections of the World as the best that can be produced. Having recently taken up the growing of Sub-tropical fruits, it will be our aim to give this department of our business the same careful attention that has made our Citrus trees so well and favorably known.

AVOCADOS

We have for Spring delivery budded trees of the leading thick skinned varieties, such as the Fuerte, Spinks, Blakeman, Dickinson, Sharpless and Puebla.

FEIJOAS

We have a fine stock of grafted trees of the large fruiting varieties.

Also Cherimoyas, Sapotes, Guavas and Loquats

Our latest price list is yours for the asking.

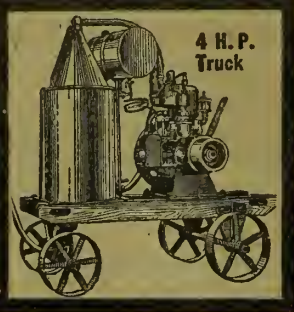
CUSHMAN

Light Weight Farm Motors

Weigh only 40 to 60 pounds per horsepower, about one-third as much as ordinary farm engines, yet are more powerful, more durable, more economical.

We get increased power without increased weight because of an improved design, better material, higher grade mechanics, more accurate balancing and improvements in carburetion, ignition and lubrication.

4 to 20 H.P.



Cushman Motors do every job that any other engine can do and many jobs other engines cannot do. Equipped with Throttling Governor, Carburetor, Friction Clutch Pulley and Water Circulating Pump without extra charge.

to the California farmer, let us review a few California experiences: The Clarchen Packing Company of Los Gatos in 1909 raised one and one-half tons of hay per acre, but in 1910 by the use of 200 pounds of nitrate of soda per acre raised the crop on the same acreage to six tons per acre. R. P. Keeble of San Jose more than doubled his crop of wheat, oats, and barley on 50 acres by the use of 150 pounds of nitrate of soda per acre.

A series of experiments conducted at the Riverside citrus experiment station, covering six years, including four years of fruitage, resulted in the production of the following average number of fruit per tree per year on the various plots, there being 20 of them: Unfertilized, 54.8; general average of all fertilized plots, 95.1; fertilized with nitrate of soda alone, 135.67.

Winter Injury

By W. T. Horne

A GROUP of troubles that can not be remedied next summer—act now.

The past year has seen loss of fruit trees from troubles which are due to climate and not to some insect or fungus against which the fruit growers can act directly. The methods of studying climatic injury have not been simplified as have some other phases of plant pathology. Nevertheless, certain diseases are known to be due to climate and something is known of the conditions within the plant which make them possible and some measures for reducing the danger can be taken.

Sour sap, meaning certain sudden dying of trees or branches in spring, is a result of cold shock on trees in exceedingly active new growth. Protecting the trees against high temperatures within the trunk and branches and so avoiding the stimulation to excessively active growth early in spring is the main preventive measure. A good coat of whitewash will reflect a considerable part of the heat from the sun on bright winter days and prevent much of the rise in temperature within the limbs and twigs which starts growth unseasonably, that is the rest period is preserved for a longer time without interruption. A tree properly nourished and coming normally into its winter rest period in the fall will be less liable to injury than one weakened by lack or excess of water, red spiders, injudicious late summer pruning, or other cause.

Water logging of the soil at any season may cause symptoms like sour sap. Whitewash is not recommended in this case.

Winter die-back in walnuts, figs and many other trees, affecting especially young and vigorous plants growing under very favorable conditions, is a drying out of imperfectly ripened wood under conditions of exposure to low temperature and excessive atmospheric drying. Lack of soil moisture in winter may accentuate the trouble. Many young walnut trees have been observed to lose their leaves by freezing and not by natural ripening this fall. The ends of the shoots and their buds are not fully matured, that is, they have not accumulated a proper store of reserve plant food, and with leaves gone no more can be elaborated this fall. This is shown by a soft green succulent texture and much flattened or angular outline, as opposed to a stiff woody texture, round outline and brown color. What these trees need to bring them through as well as possible is adequate moisture in the soil and protection against excessive atmospheric drying and against warming up by the winter sun. A good coat of whitewash is the most practical measure for protecting the top. Where the immaturity is noticeable clipping off the most immature parts of the shoots will doubtless be beneficial by reducing evaporation.

In recent years many young vigorous trees have shown serious injury to the trunks, especially at the surface of the soil. Trees up to several years of age may be affected, but it is especially the younger ones which are liable to suffer. The inner bark and wood in the vicinity of the cambium are affected and often the tree is girdled. Early in the season nothing is visible unless the trunk is cut into. Oranges, prunes and various trees have suffered and often under most favorable conditions in the best lands. The injuries do not become apparent until the following summer, when the trees suddenly fail and the most intelligent and observant growers have suspected fungous or other infectious diseases. More or less gummosis may accompany the trouble and probably there is often complication with various infections. Low temperature affecting trees which are imperfectly ripened because of excess vigor is the cause of this trouble. The condition when discovered should be treated by cleaning the wounds and disinfecting with Bordeaux paste, but much may be done in the way of prevention by coating the trees in winter with whitewash and protecting the crowns either with loose earth or by wrapping with cornstalks or similar material to prevent warming up by the winter sun. When frost danger is completely over the coverings should be removed, since they may harbor pests or by the moisture occasion brown rot or other infections.

Every year many nursery trees come to the agricultural college—some before, some long after setting—which have had the roots dried or frozen, or both. When the bark of the roots is cut into it is found to be rather dry and has dead brown specks or spots. Such trees fail to grow and become a source of serious loss. Professor J. C. Whitten has given us unpublished data showing that the roots of even hardy trees are very tender to cold and are easily injured by even slight freezing. The roots of all nursery stock should be protected from drying and from the slightest frost. It appears that there is danger of injury, both by cold and drying, where the digger is run under the trees and they are allowed to stand before lifting.

Many trees from nursery shipments show a dark, water logged condition in the sapwood, the bark being normal. Such a condition has been traced in many cases to winter flooding or other water injury in the nursery, often combined with freezing. Such trees should not be sold as first class, but if they are set under favorable conditions and get a good start, will often make good trees.

Deciduous nursery trees have sometimes been infected with the brown rot fungus of citrus trees or a very similar one when healed in a wet situation, causing the bark to rot. Nursery stock on receipt by the orchardist, or at latest on planting, should be whitewashed and given most careful attention to prevent freezing of roots or drying.

Black heart of apricots appears from study by approved pathological methods to be caused by a fungus. However, since only young and succulent trees are affected, winter injury may be a predisposing condition and winter whitewashing should help to prevent this.

Certain plants, like young citrus trees, avocados, or young figs, in very frosty localities may not be sufficiently protected by whitewashing, and should have covers of burlap, cornstalks, tules or some other convenient material with the soil mounded up about the crowns of the trees. Some plants like tomato gradually lose vitality and die in a continuous low temperature without actual freezing.

Measures for preventing winter injury consist, then, in securing as favorable moisture conditions in the soil as possible with irrigation or provision for drainage where needed, and in whitewashing the trees in early winter. Carefully conducted experiments by Dr. J. C. Whitten, now professor of pomology, University of California, have shown that a good coat of whitewash reflects the heat of the sun from the limb or twig instead of allowing it to be absorbed, so that a twig that is not whitewashed warms up much more than one which is well coated. This rise in temperature

greatly accelerates evaporation from the twig, causing it to dry out. It also tends to break the rest period, causing a slight start to growth prematurely. This invisible starting to growth greatly weakens the resistance of the buds and tree generally. A whitewashed branch may not be visibly different from another in spring, but actually may be in much better condition, as shown by resistance to winter injury and subsequent success in setting and maturing a crop.

A good whitewash should stick until spring. Bodies, main limbs and as far as practicable the whole tree should be covered for most complete results. The following formula is suggested: Quicklime five pounds, salt one-half pound, sulphur one-fourth pound. Slake the lime slowly with water and add the salt and sulphur while it is boiling. Add enough more water to make a good wash. This is good for whitewashing the bodies of trees in the fall.

This whitewash should also have considerable fungicidal value and help in preventing certain serious winter infections. It may be applied with a brush or strained and applied with a sprayer. We have no intimation that whitewashing can ever injure a tree in any way or in the least measure.

FIGS FROM CUTTINGS

Now is the golden time to make fig cuttings, and none need be backward in the attempt, for with reasonable care every cutting should grow. The writer has rooted small numbers, 50 or thereabouts, and all would live. In these lots both tips and secondary growths were used and no difference between the two was noted. It may be that a tip cutting will make a quicker and less robust growth than the heavier wood, for experience shows this to be the case by a small margin. Tip or terminal cuttings may be allowed to stick above the soil, but in heavier wood it may be as well to bury the cutting complete and get a new leader. Cuttings usually range from eight inches for a short jointed sturdy secondary to 12 inches for terminals. If the soil is light or free and contains no decaying organic matter nearly every cutting will root.

If soil is pasty, drainage poor, or fertilizer present, it is as well to wax or paint the cut ends. This will insure a greater measure of success. Above all, make all the cuts with very sharp knife or shears; the knife is best but for large amounts it will be found more economical to use pruning shears. If care is taken, in a light soil the cuttings may be tied in bundles and planted upside down. This places the top in the cool dark soil where tops cannot start and leaves the butt ends near light, air and warmth where they will more quickly callous. Four inches of soil should be above the cuttings and this must not be allowed to dry.—E. B.

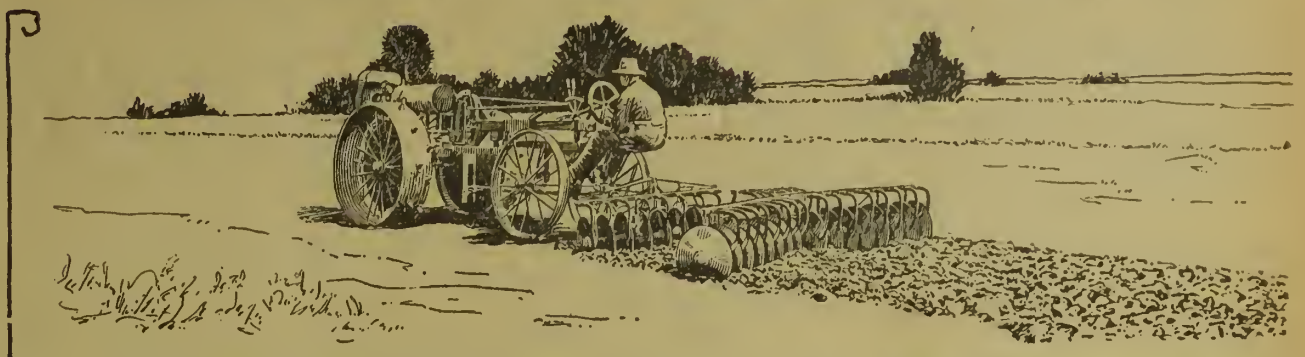
EXTENSIVE GOPHER DRIVE

F. E. Garlough, of the board of biological survey, United States department of agriculture, is due to arrive in Los Angeles January 24, and on that date County Commissioner Ryan intends to begin an extensive concerted drive on gophers in the Antelope Valley and a few lesser areas. This will be the largest movement looking to gopher extermination ever undertaken in Southern California. Mr. Garlough will give a number of field demonstrations and Mr. Ryan hopes to detain him for a week or ten days. At present the county force is working on ground squirrels.

GRAPE SEED OIL

We may soon be using raisin seeds to paint our houses, through the discovery of the United States department of agriculture, which has recently found a method of extracting a fine quality of drying oil from the waste seeds. In addition to this oil, the pulp clinging to the seeds can be made into an excellent fruit syrup to be used as a flavoring in carbonated drinks, and the interior of the seed yields an excellent grade of cream of tartar. More than 4,000 tons of seed have been wasted annually heretofore. It is now estimated that the by-products have a value of more than $50,000.

RELY ON MOLINE
For a Good Seed Bed



Use a Moline Disc Harrow and you will get a good seed-bed—one that is mellow, fine, deep and clean. No matter what your requirements, for horse or tractor use, there is a Moline Disc Harrow suited for you.

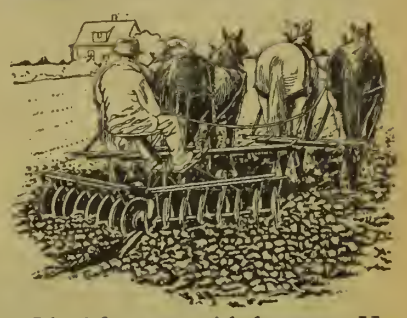
Moline Leverless Disc Harrow

For All Makes of Tractors

This is the handiest and best disc harrow for tractor use ever made. There are no levers to bother with. To angle the discs, release a latch and drive the tractor forward. To straighten the discs just reverse the tractor. The tractor does all the hard work. It is built extra strong and durable, has great flexibility and penetrates well. Built in 6, 7, 8, 9 and 10-foot sizes, double or single cut, and can be used with any tractor.

See your Moline Dealer or write nearest Moline Branch for full information.

Moline Three Lever Disc Harrow



Ideal for use with horses. Has great flexibility and end thrust is taken up by the frame. Gangs cannot bump or ride, making very light draft. Third lever regulates depths of gangs and can be instantly adjusted. Very strong and durable. Made in a variety of sizes —single or double cut.

OUR Catalogues

For more than 35 years we have been issuing a fruit and ornamental tree catalogue. Horticulturists everywhere have come to look upon these annual books as real practical planters' guides, for they contain a lot of good information that is invaluable for the grower to have.

Our new 1920 Catalogue and Price List is now ready. It will be mailed to you free on request.

We grow about everything that grows in the way of trees, shrubs, vines, roses, berries, etc.

We pack our nursery stock so it will reach its destination in perfect condition.

We are always glad to hear from prospective planters.

TRACTOR SHORT COURSE AT RIVERSIDE

A feature of the gas tractor short course, which is to be held at the citrus experiment station, Riverside, February 23-28, is the compendium of lectures given to each student. This booklet contains in condensed form all the lecture material and directions for performing many of the operations involved in the repairing of tractors. Aside from relieving the student from taking notes during the lectures this allows him to give undivided attention to the charts, models and tractor parts which are used throughout the course.

The course is divided between lectures, demonstration and practice work. Two one-hour lectures are given daily to the entire school. During the other six hours students working in groups of approximately 18 either operate tractors or attend demonstrations of motor repairing, magneto timing and trouble finding, carburetor adjusting, etc. Twelve makes of tractors will be used in the course.

For further information concerning this course write Director, Citrus Experiment Station, Riverside, California. The course is limited to 180. The students muts be over 18 years of age and ether own, operate or be directly interested in tractors. Enroll now if you wish to attend. Application should be accompanied by registration fee of $1, which is the only charge connected with the course. Rooming accommodations should be engaged in advance.

STAMPING INDIVIDUAL FRUITS

The offer of the Walnut Growers Association of a $10,000 prize for a machine which would stamp a trademark on each walnut shipped by the association has started several things. In the first place Mr. Wysong entered in the competition a most attractive machine for the purpose desired. This was only one of several entries. However, Mr. Wysong carried away the laurels, and if he has not yet carried away the $10,000 he will within a short time. In addition he has invented a machine for stamping oranges. It is quite probable it would be effective for using on apples or other fruits. Instead of impressing the trademark design by a die it is done by a vacuum process. Specimens of the trademarked oranges brought to the Cultivator office show trademarks impressed which seemed absolutely indelible and which were perfect from a mechanical standpoint and, we understand, economical of handling.

The protection given to the marketer of a high grade fruit by a trademark is well worth the slight cost which these machines involve. We believe it will give an impetus to the movement encouraging production of higher grade fruits and other products.

It has been pointed out that the labeling of such fruit as oranges, lemons and grapefruit would give especial protection in Eastern markets. Californians generaliy are more or less familiar with the fact that their citrus crops have different grades of quality. They are therefore able to judge more intelligently as to quality. However, the general public outside the citrus belt is not so well posted. This labeling device will enable the outside public to choose the quality of the fruit with certainty by selling the "brand" on the fruit itself.

HAVE A HEAD AND USE IT

We find your paper very useful as it is now printed, but we would like to hear more from practical farmers. We get so much advice from advisers. This does not refer to farmer county advisers, but to would-be advisers that are continually advising the farmer and broadly hinting that he ought to use his head as well as his hands. We find that class willing to use their heads, but offer them a job at so much per day—they leave you quickly. Would you change your method of pruning if you had found this method to be profitable for a new, unproven method? I believe we ought to try a few trees in the new style, but not a whole orchard. Orchardists, open up and show that we sometimes use our heads.—Alex McGregor, Newhall.

Mr. McGregor gives some excellent suggestions. Best of all, we take it, the tone of his note indicates the advisability of the farmer having a head and then using it. It has been the custom of the Cultivator to encourage these practical suggestions from the practical worker. We want, however, all the advice the adviser can give us, whether he be the county farm agent, who is an official employed to give us the best and latest information, or any other whose lifework has been given to investigation and to determining basic facts. There are still long questions and unsolved questions which the agriculturist has to answer, and the more help he can secure from the keen observer the quicker will come the larger profits. But here is where it is up to the farmer to sift out, and perhaps the best way to sift out is to try out many of these suggestions, but if a pruner or a sprayer or a soil specialist offers plans which are contrary to those which have proven satisfactory in the hands of the farmer, there should be no immediate change in procedure until careful testing has proven the suggestions to be good or otherwise.

SET NURSERY STOCK CAREFULLY

Nursery stock which is worth buying is worth proper planting and care. Even if the nurseryman has guaranteed to replace stock which does not grow the first year, it is to the advantage of every planter to care properly for the plants. Even if the plants are replaced the grower is out the time spent in planting, and the greater loss—one year's growth and development in the plant.

Get the stock as soon as possible after it arrives at your station. Don't wait until it is convenient if plants in the best condition are desired. Open the package at once and determine the condition of the plants or trees. If planting is to be delayed several days, heel in the stock to prevent the roots drying out. If already dry, soak the roots in water for 15 to 20 minutes before heeling in.

Most planters send their orders early to the nurseryman so as to get better service and better stock. Bear in mind that the nurseryman should have your order well in advance of the shipping date.

AN INTERESTING CATALOG

Few seedmen's catalogs contain so much of interest outside plant descriptions as the 1920 issue of Aggeler & Musser Seed Co. For 27 years this catalog has been steadily built up to its present high standard by including answers to the more common questions asked in store or correspondence, until it has become, in part, an agricultural almanac.

Many novelties may be found in these pages, one of which is a branching corn, strongly recommended for ensilage, and a picture is shown of one stalk with two main ears and five branches each bearing an ear. Large space is given to grasses suitable to dry hillsides, desert soils or those too strongly alkaline for other crops.

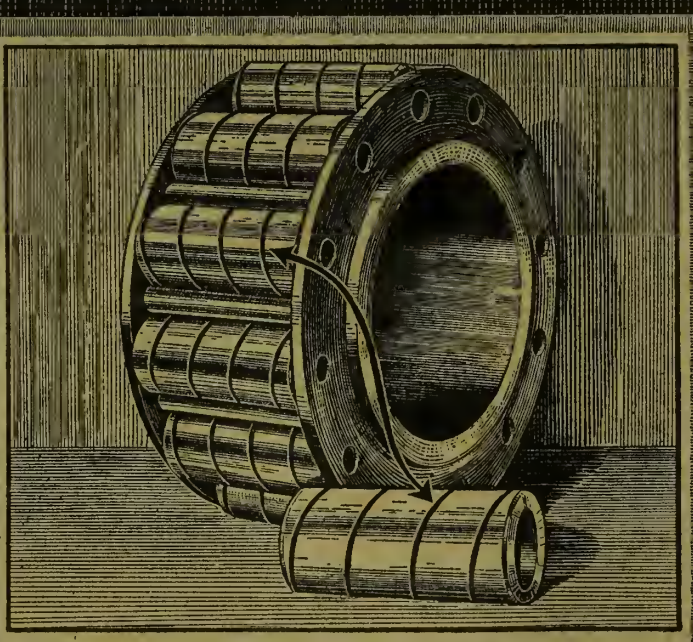
A HALF CENTURY RECORD

The fiftieth annual edition of the catalog of the Germain Seed and Plant Company is out as "Germain's Garden Cyclopedia for 1920." It is 48 pages larger than last year's book and has many interesting features not before included. One of these is three pages of recipes for the best handling of vegetables and other garden produce in the kitchen; and tables of useful information to the farmer have been enlarged. The most noticeable of the 1920 novelties is the "Big Jim Corn" named for James J. Jeffries, the famous heavyweight among men as this novelty is among corn. The firm will present a silver loving cup, valued at $60, to the person sending in the three biggest ears of Big Jim Corn, to be judged November, 1920.

TEHAMA FARM BUREAU MEETING

Oak Park, January 9; Antelope, 13; Dairyville, 14; Bend, 16; Richfield, 19; Corning, 21; Los Molinos, 26; Proberta, 28; organization meeting at Liberal school, 30. Directors' meeting on January 23 at 10:30 a. m. A meeting date for a new center at Capay Ranch will be set during the month.

HYATT
ROLLER BEARINGS



There's No Bearing Like Hyatt

THE Hyatt Bearing stands alone because it is the only bearing having a Hollow Spiral Roller.

This construction gives to the Hyatt Bearing all of the desirable advantages found in any other type of bearing—plus the additional advantages of the Hyatt Spiral Roller.

Because this hollow Spiral Roller is less affected by vibration and shock than a mere piece of solid steel Hyatt Bearings provide against wear most effectively. They give a *permanent* protection that lasts as long as the shafts themselves.

Hyatt Bearings never need adjustment.

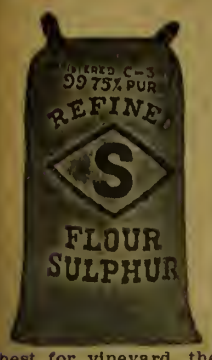
SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphur that money can buy; the best for vineyard, the best for bleaching purposes, LEAVING NO ASH.

VENTILATED sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste Sulphur.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California Street, San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR." Price List, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred.

Place Your Order NOW for Nitrate of Lime

Guaranteed not less than 13 per cent Nitrogen—almost 100 per cent Pure.

Nitrate of Lime supplies Nitrogen in the most available form. Packed in solid wooden casks about 240 pounds.

Ask for prices, delivery from warehouse, Los Angeles and San Francisco, or steamer, January, 1920.

IRON AGE GARDEN TOOLS

Answer the farmer's big questions: How can I have a good garden with least expense? How can the wife have plenty of fresh vegetables for the home table with least labor?

This Hill or Drill Seeder and Wheel Hoe Combined

solves the garden labor problem. Takes the place of many tools—stored in small space. Sows, covers, cultivates, weeds, ridges, etc., better than old-time tools. A woman, boy or girl can push it and do a day's hand-work in 60 minutes. Many combinations and prices. Write for free booklet today.

The California Cultivator Costs Only $1 Yearly

STATE DEPARTMENT OF AGRICULTURE SUBMITS STATISTICS

Director Hecke in presenting the following figures compiled by the division of animal industry, calls especial attention to the need for increased cattle and livestock production as a necessary part of well balanced and successful agriculture,

The office of dairy inspection has recently completed the figures representing the growth of the dairy industry in this state for the past year. Detailed tables by counties, with other information and results, will be published in January. At this time only a preliminary statement is given. It can be seen by this that the volume of production has trebled any yearly increase in the past six years.

With 501,000 producing dairy cows the sales of products for the year 1919 reached the enormous sum of $74,515,381, which, compared with last year is over $20,000,000 increase. But it must not be concluded that the dairymen of California have this amount on deposit in the banks; this sum represents the gross receipts and from it must be deducted the operating expenses, which for the past year have almost doubled, while the increase in price of milk and other products has not been proportionate.

$10 AN ACRE

An old time subscriber of the Cultivator, B. M. Hampton, now living in Florida, writes of the good old times in California in 1872 when he first came to this state. At that time he negotiated for a piece of fine level land, on which a part of the city of Los Angeles now stands, for $10 per acre. The town then had a population of 5,000, only 1,500 of whom were Americans. He had no sooner begun his negotiations for the land when "along came the knockers and scared me out of it. I've been down on knockers ever since. Yes, it was a desert town O. K., and none too healthy, either, for there were too many 'skeets,' fleas and bedbugs and poor water. Somehow I think Los Angeles about the most wonderful town or city in the United States." Connection with the outside world was then secured by stage to Bakersfield, where the Southern Pacific ended, or by stage to Santa Barbara, where a vessel could be taken to San Francisco.

RINGING FRUIT TREES

The practice of ringing vigorous but unfruitful branches of orchard trees is still quite common and a very effective method of changing the character of strong but sterile limbs. It is much in vogue by possessors of large avocados and tropical fruit trees that have not fruited, and the practice has met with success. With dooryard trees of apples and pears it has been successful, but with stone fruits it usually causes gumming without added fruit production. Grapes and tomatoes have also been ringed with good results. On deciduous trees a quarter inch ring should be taken out in April, down near the base of the branch. The ringing arrests the upward flow of thin crude sap and stops the downward sap which is used to force fruit buds.

THE ACRE RANCH

Examples are not uncommon where one person is making a living from one acre of ground. One suburbanite has six pure bred goats and a small patch of Napier grass to feed them that is cut every ten days from June 1 to November 1. The goat shed and chicken houses are covered with chayotes and the fences with cane berries. Some of the trees, shrubs and plants are in fruit each month of the year. No garden space is allowed to lie idle. Everything the owner consumes except meat and bread is raised on the place and the chickens and eggs sold buy both these essentials. The owner claims his bank account is slowly growing.

A Miller & Lux tract of 32,000 acres in Madera County is being sold in small parcels.

Orchardists of Sutter and Yolo Counties pay but one dollar a ton for barnyard manure.

Agri GYPSUM

Time was when crop producers plowed, planted and harvested. Seed was seed and ground was ground. Some still "farm in the ground." Many others, however, farm partly in the ground and do the most valuable work in their heads. Such farmers find AGRI GYPSUM, applied to land for crops of alfalfa, beans, beets, cotton, citrus and deciduous crops and truck gardens, releases bound up elements in the soil that are essential as plant foods. AGRI GYPSUM causes chemical changes in the soil that liberate nitrogen, potash, phosphorus, etc.

Potatoes are greatly benefited by an application of gypsum to the soil.

As a fertilizer AGRI GYPSUM contains about 44 per cent sulphur, a very much needed element in the growth of alfalfa and similar crops.

ARGI GYPSUM applied on alkali soil will neutralize the alkali, rendering it harmless to the growth of vegetation. This is officially recommended. Considering costs of nitrates, phosphates and other crop producing elements, you can save money by alternating fertilizers with ARGI GYPSUM and obtain equally good if not better results.

Gypsum applied to beet land produces a vigorous growth.

Ask your dealer for AGRI GYPSUM made by the largest manufacturers of gypsum in the world. And you will be sure of the product, ground fine to do the most good with the least amount used. If your dealer cannot supply you write

Money in Rabbits

Can I make money raising meat rabbits only or must I raise fancy stock also?—Subscriber.

You can make money raising rabbits for meat purposes only, but why raise stock which you can sell for meat purposes only when by raising better stock you can supply both the demand for meat stock and good breeding stock, and if by good line breeding one can produce prize winners, better still. Even Wall Street has put the seal of approval on this for none other than Thomas Lawson, the famous king of the copper market, has taken up rabbit raising. He has stocked up his estate with 1,000 rabbits of high standard and he affirms that raising rabbits is a safer bet than dabbling in the stock markets. We must get away from the old idea that rabbits are children's pets and only the demand for food has brought them into prominence. The truth of the matter is that rabbits for meat purposes rank higher than pigs and cattle and that we in the United States have overlooked this fact while foreign countries have known it and raised them for this purpose for years. The writer had for lunch today a piece of Himalayan rabbit, and not only did it furnish meat but a good hide for fur. One has only to ask any of the ladies of the Coney Fur Club of Los Angeles to find out the profits of raising rabbits for fur as well as meat. The writer raises the best rabbits he can of four varieties and supplies as best he can the demand for meat, fur and fancy. Not all raised are fancy nor are all raised good breeding stock, so those that fall below make good meat stock. If one will use the same laws of common sense and application, in short make a business of it, he will make a success of rabbit raising for meat purposes and better still for meat, fur and fancy.—W. D. W.

Walnut Irrigation

Herewith walnuts, blackened and dried hulls clinging to the shells. They have no marketable meats. A large proportion of the nuts on the trees are thus affected. The trees have been irrigated practically every week but have not had cultivation.—Subscriber, Los Angeles.

This looks like a case of improper irrigation method, though sufficient water may have been applied to the surface and at frequent intervals. Soil that is at all inclined to run together will become almost impervious to water after a few irrigations if it is not cultivated after each irrigation. Then, too, if a small amount of water is applied under such conditions, it would practically all evaporate before the next application, without going deep enough to reach the principal part of the tree roots. The evaporation from land which has not been cultivated is about the same as from a pool of standing water, and when there is a warm wind moving this may be half an inch of water a day from the surface. We would not like to irrigate any land as often as once a week. If the soil was porous at the top and of a heavier nature a foot or two lower we would expect the soil to become saturated and cause the tree roots to decay and in that way kill the trees. If the soil was porous down ten feet we would expect to leach out all the soluble fertility though the trees would live for a few years. It is very likely that frequent deep cultivation, with irrigation water applied in such quantities as will keep the soil always damp to a depth of five feet, is the remedy.—J. B. N.

Almonds

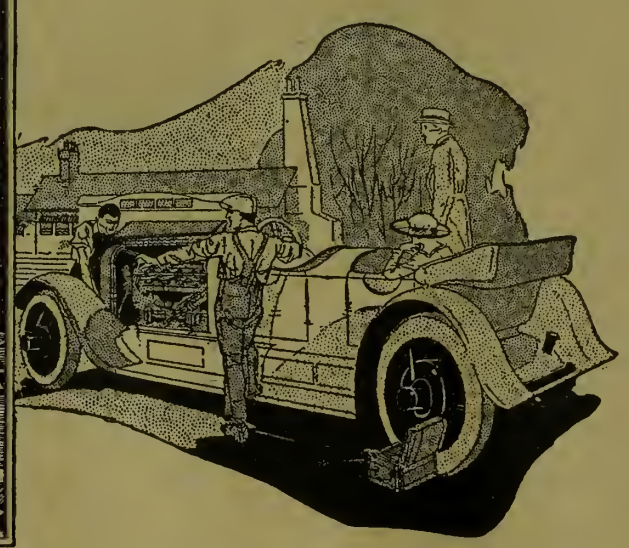
In the Cultivator of November 29 I notice an article on almond culture and as I am interested in the nut industry I would like some additional information along this line. I am just recently from the East and would like to know as to the best almond section, distance apart to plant almond trees, and at what age they will begin to bear.—Subscriber, Santa Cruz.

It would perhaps be impossible for anyone to say which is the best almond section of the state but one may get an idea by noting where the greater portion of the nuts of the state are produced. The three counties which produced above 1,000,000 pounds each in 1918 are Yolo, San Joaquin and Contra Costa. However, other large producing counties are Butte, Colusa, Merced, Riverside, Sacramento, Solano, Stanislaus and Sutter. San Luis Obispo County is becoming a large producer also. Requirements are: Mild or hot climate, combined with freedom from high humidity (fogs) and frosts at time of blossoming, which in the case of almonds is early; loose, warm, light soil, sandy loams, of good depths (12 feet) with sufficient slope to provide good air and water drainage; no alkali; ample moisture and moisture retaining soils are chosen; little irrigation is given. Distance apart is 28 by 28 feet, which makes a total of 55 trees per acre. Distance apart, however, depends upon soil conditions. They will give self-sustaining crop at six to eight years and perhaps full crop at ten years of age.

Begonia Leaves

Please give me names of plants from which I enclose leaves. Also tell me why these leaves die at edges, as you will see, and then fall off. There are no insects on them.—Subscriber, St. Helena.

The leaf with the small silver spots is from Begonia argentea guttata. The other begonia is hard to determine for



Carbon
a real danger to your engine

WHEN your car isn't pulling right—when the spark plugs start to miss fire and the engine knocks on the hills—when the water boils after a short run—then you know the engine is full of carbon again.

Carbon is the worst enemy of the gasoline or kerosene engine.

Ordinary Oil after use *Veedol after use*
Showing sediment formed after 500 miles of running

The causes of carbon and how to prevent its formation

You need not permit your engine to be fouled and damaged by excessive carbon deposits. There are but two natural causes of this rapid accumulation: 1. Inferior oil that forms sediment, or oil that is too heavy or too light in body. 2. Too rich a gasoline mixture. (This can be improved by a slight carburetor adjustment.)

Carbon is formed by ordinary lubricating oil which breaks down under the terrific heat of the engine—200°F. to 1000°F. Large quantities of black sediment are formed. The oil is left thin and watery. This thin oil fails to hold the piston seal. It permits the broken-down oil and sediment to pass the pistons. In the firing chamber, it rapidly forms great plates of carbon.

The striking superiority of Veedol over ordinary oil is clearly illustrated by the two bottles. Veedol reduces sediment 86%.

With the correct grade of Veedol in the crankcase and with a proper fuel mixture, *carbon does not form rapidly.*

Buy Veedol today

Leading dealers have Veedol in stock. Ask for it today. The new 100-page Veedol book will save you many dollars and help you keep your engine running at minimum cost. Send 10 cents for copy.

it has no marked characters to distinguish it from a score of closely allied hybrids. It resembles B. Thurston. The cause of the leaf-drop may be any one of many, lack of food, of water, of drainage, or improper soil. No one could tell you without examination of plants, soil, and exposure, for it may even be due to sunburn.

Apricot Pits for Planting

Please give me general directions for starting apricot pits for nursery. Can I follow the same directions which you give in your issue of December 13 in answer to question regarding peach pit planting?—Subscriber.

See Peach Pits for Planting on page 795 of the issue of December 13. Put apricot pits in moist sand at once and handle in same way as advised for peaches.

Ants Killing Pigs

Am troubled with infestation of ants in breeding pens. Young pigs are hardly farrowed before they are covered with a swarm of ants which sting them to death. The entire litter may be killed within a few hours after farrowing. What can I do to prevent this?—Subscriber, Calipatria.

This is a novel situation to most of us, though a leter from Horticultural Commissioner Waite shows piggeries in the Imperial Valley have been confronted by it for some time. Mr. Waite writes: "In answer to your letter of December 17 will say that this has been going on for years. Some seasons the ants are worse than others. The best remedy is to pour a saturated solution of potassium cyanide in their holes at noon or during the hot time of day when the ants are in the ground. A few applications will usually get them all."

FLOUR AND FLOUR PRICES

The United States Grain Corporation made no purchases of flour during the last two weeks on the Atlantic seaboard, although offers by the mills were fairly liberal, because the enormous flour stocks already on hand and the resulting congested condition of storage facilities for package goods at seaboard points continue to make purchases inadvisable at this time.

On the Pacific Coast purchases of flour are being made from the mills, but the amounts taken are less than the average of former months. The San Francisco office has accepted offers for about 100,000 barrels for January delivery at $9.90 per barrel f. a. s. and $9.75 per barrel f. o. b. track, packed in 140 lb. jutes. Three Shipping Board steamers, carrying about 250,000 barrels of flour, will be loaded and cleared from San Francisco Bay during the next ten days by the San Francisco office of the Grain Corporation, destined to the Atlantic seaboard for orders.

The Grain Corporation will continue to sell its standard pure wheat flour to the domestic trade during January at the same prices advertised for December.

Carload lots are offered by the Grain Corporation delivered to any main line rail point in the United States at $10.60 to $11.75 per bbl. Less than carload lots will be furnished at 75 cents per barrel additional to all points not able to buy flour of equal quality direct from the mills at similar prices.

The mills in California are now selling fair quantities of this flour to retailers in practically all the principal towns and cities. The maximum prices to be charged to the consumer by retailers are: ¼'s (49 lbs.), $3.15; ⅛'s (24½ lbs.), $1.60; 10 lb. packages, 69 cents.

ASHES KILL

A dispatch from Tokio, Japan, states that ashes from a volcano in Kyushu, falling upon grass, have caused the death of much livestock and also of plants. This is not usual, so far as killing of plants is concerned. While in the foothills some miles east of Los Angeles recently the writer saw bignonias and other vines on roofs apparently killed quite recently. Inquiry developed the fact that ashes from recent forest fires were blown down by a stiff wind and settled on the plants while the latter were damp with dew, destroying the life of at least the foliage. The vines were doubtless not seriously injured.—E. B.

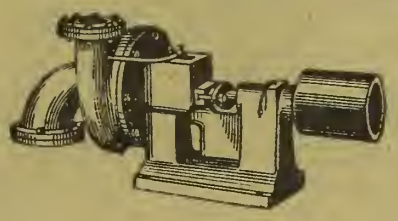
Our 1920 Catalog is the most complete book of its kind ever published.

it's FREE!



After 20 years

A PUMP developed out of a 20-year experience in building pumps is one from which to expect the highest efficiency.

Such is our BEAN UNIVERSAL PUMP—BELTED.

It's the pump we have selected out of a full line because it embodies all of the strong features found in all of the others.

Practically all centrifugal pump troubles, when they do occur, are stuffing box troubles. To prevent them we provide a generous water sealing bowl. Filled with water, the shaft is completely surrounded where it enters the case. As a result, danger of loss of priming is minimized, nor is it necessary to cinch the packing down so tight that the shaft is injured. It is not difficult to see the advantage of this feature.

This Bean Universal Pump

is provided with an automatic water balance and an extra heavy, oversize outboard bearing. This bearing provides almost unnecessary insurance against excessive vibration and makes belt changes easy and simple. An extra web of metal between the sealing bowl and the outboard bearing standard provides against strain and vibration. It's a liberally braced, sturdy pump. Both suction and discharge adjustable at any angle.

Let us tell you the kind of equipment to install to insure the largest head of water at the least cost.

Kill the Squirrels

THE squirrel campaign, inaugurated a few years ago as a public health measure, has increased in efficiency and become more largely an economic measure. California has spent millions in feeding ground squirrels and it has been found too expensive a luxury to continue. Horticultural Commissioner Ryan of Los Angeles starts the new year with an intensive campaign. He has just issued a circular giving methods for using carbon bisnlphide. He is ordering this material in carlots, and is prepared to supply campaigners at cost. It is distributed in five gallon cans at $5.00 per can but no future deliveries are guaranteed at any price. Jute waste balls, 800 to the sack, are supplied at $3 per sack. In circular just prepared Mr. Ryan gives explicit procedure. From it we quote:

"Put as many waste balls as convenient into a common bucket or other receptacle handy to carry, pour carbon bisulphide over until covered, pour a small quantity of water or kerosene over this to form a thin film (one-fourth inch) which will float on top and prevent evaporation and waste of material. It will require about one gallon of carbon bisulphide to 60 of the commercial waste balls. The waste balls should be of some absorbent material that when saturated will retain about two ounces of the carbon bisulphide. This amount of liquid when vaporized and mixed with air forms a gas of sufficient strength to kill a squirrel in the ordinary burrow.

"In treating an area infested with squirrels, place one saturated waste ball as far down each squirrel burrow as possible, then cover the entrance to the burrow with earth and tamp it well to prevent any of the gas from escaping. Waste balls can be taken from the liquid by means of a hook, forceps or the bare hands. No injury to the skin will result from handling this material as it is harmless as gasoline to the touch. The above method of squirrel control in many instances has proven on one application to be 100 per cent efficient.

"Due to some of the squirrel burrows being very extensive and so constructed that there are pockets formed by elevations in the burrow, the following method is given.

"After introducing the waste ball a period of time should be allowed to elapse to insure proper vaporization of the liquid, this depending on the weather. For instance, a warm day would require four or five minutes, a cold damp day as long as ten minutes. This period can be utilized by placing balls in other burrows. Following the waiting period, a match or torch can be applied to explode the gas formed. This explosion will tend to force the gas to the more distant recesses of the burrow. The exploding of the gas also increases the volume. Immediately following the explosion of the gas, the burrow should be tightly closed to prevent escape of gas.

"A suitable torch can be made by attaching a waste ball saturated with kerosene to a wire about two or three feet long. Care should be taken to stand at one side of the burrow while igniting the gas as in many cases the flame will shoot several feet out of the entrance.

"Exceptional precautions must be taken to keep fire away from containers holding carbon bisulphide in view of extremely inflammable nature of the material.

"In using carbon bisulphide as a follow-up method, i. e., where poison grain has reduced the squirrels to a minimum, or in cases where the number of burrows greatly exceeds the number of squirrels present, it would be advisable to go over the territory and close all open burrows and after waiting a week or ten days, treat all burrows that have been reopened."

More Wheat

By Norman F. D'Evelyn

The days of gold in California are not so far gone but that the oldest inhabitant of every town, and many of the younger inhabitants, can remember the thrilling days when countless thousands braved the long trail that led across sun baked deserts and snow capped mountains and countless other thousands preferred the terrors of the sea voyage crowded on board unseaworthy vessels to the possibility of being massacred by the Indians, just to "go West."

Those were the days when California justly earned her title of "the golden state"; not because of the vast wealth being taken from her soil in ore—Alaska has given far more gold to the world yet has never been called "golden" — but because of the great fields of golden grain, becanse of the wealth being taken from her soil in wheat. She was truly a golden state in those days.

The wheat growing industry came to California with the Spanish padres. Small fields about the missions were cultivated, and from this humble start the industry grew until in 1896 the wheat production of the state was 53,000,000 bushels.

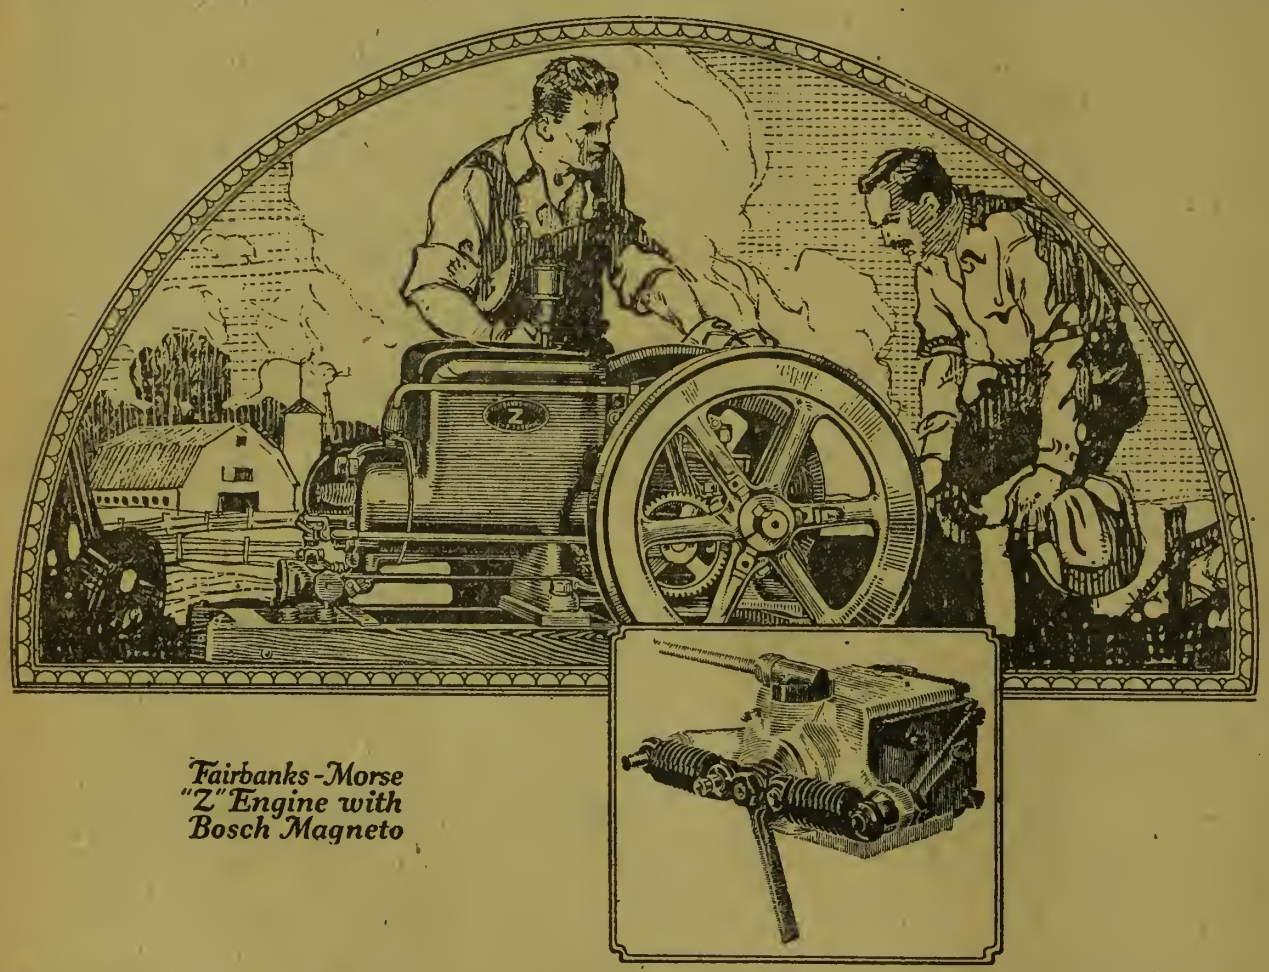
In the early days the wheat was cut by hand and taken to the nearest grist mill where it was ground into flour between two great fluted stones. Such was the early mill of Austin Sperry, established in 1852 at Stockton. In 1882 tne original mill was completely destroyed by fire, but a new one was immediately built and equipped with the most modern roller type machinery. The local demand for wheat has increased, many milling companies have sprung into existence, but the crops have dropped off annually—in 1918 there were but 7,000,000 bushels produced in the entire state.

The "Plant More and Better Wheat" campaign launched by the Sperry Flour Company is an earnest endeavor to raise California to her former and rightful place among the leading wheat producing states of the country, and comes as the culmination of four years of experiments with wheat and s ils.

In 1915, at the close of the Panama-Pacific International Exposition, this firm secured 23 varieties of wheat from the Australian exhibit, and with these as a foundation determined to develop an early maturing wheat adaptable to California conditions. Five farms have been leased and devoted to experimental work. The latest acquirement was the J. O. Robinson ranch of 680 acres, about 11 miles east of Stockton. On these farms the various varieties were planted and cared for under the direction of George B. McLeod, and it was finally found that the Early Baart and the Bunyip varieties wonld thrive in California soil.

All further efforts of the company were devoted to perfecting true-to-type seed of these two varieties, and the purpose of the present campaign is to release to the farmer the information gained through their investigations. Wheat experts visit the farmers at their farms, telling them of the problems which are apt to arise and of their solutions; and a series of bulletins has been issued containing information regarding the treatment of the soil, the market for wheat and barley throughout the world, and all other data that is of interest to the farmer about to put in his crops.

This year the early maturing wheats, Early Baart and Bunyip, have an excellent opportunity to prove their true worth. Though it is an adverse season—fully 30 days late—they can be planted with tho assurance of a good yield, whereas the later maturing standard varieties of the past might not come through. The acreage sowed in wheat this year is 22 per cent less



Fairbanks-Morse "Z" Engine with Bosch Magneto

Farm Engine Supremacy

THE famous "Z" Engine and the Bosch high tension, oscillating magneto combine to make the one SUPREME farm engine. ¶ The dependability of the Bosch in delivering a steady succession of hot, intensive sparks is well known and adds the one possible betterment to the "Z"—always recognized as America's foremost farm engine. ¶ Call on your "Z" Engine dealer and see the result of this newest combination—FAIRBANKS-MORSE "Z" WITH BOSCH MAGNETO. ¶ Over 200 Bosch Service Stations assist our dealers in delivering maximum engine service. ¶ Prices—1½ H. P., $75.00—3 H. P., $125.00—6 H. P., $200.00—all F. O. B. Factory.

than last year at this time. According to government figures last year's crop was 95 per cent normal and this year's prospective crop but 89 per cent normal, which gives promise of high prices.

"RECOMMENDED GRADE" POTATOES

Owing to the small quantity of California certified seed potatoes now being produced and the demand for a better grade than can be found in the general market, it has been found advisable to make a somewhat lower grade of inspected seed potatoes. A committee to formulate the standards for such a grade was appointed by the California Certified Seed Potato Growers Association at its meeting in Los Angeles, December 10. The certified seed potato inspector of the state department of agriculture was a member of this committee. Upon the recommendation of this committee the department has established the following standards for what will be known as "Recommended Grade" seed potatoes. These potatoes will be inspected by the state seed potato inspector and every sack passing such inspection will bear a tag stating they have been so inspected and bear the name "Recommended Grade." "Recommended Grade" seed potatoes shall pass the same rigid field inspection as does certified seed stock. The only difference is in the grading of the potatoes after they are harvested. After grading they shall come up to the following standards:

Freedom from dirt, frost injury, cracks, cuts, damages by insects, exclusive of tuber moth; an allowance of six per cent by weight will be permitted.

Damage by forks in harvesting, two per cent permitted.

Second growth, two per cent permitted.

Variation below 1½ ounces and above 14 ounces for round varieties, five per cent permitted.

Variation below 1½ ounces and above 16 ounces for long varieties, five per cent permitted.

No potatoes shall be included that show by inspection on vine or tuber the presence of the diseases known as black wart (Chrysophlyctis endobiotica Schilb), powdery scab (Spongospara subterranea (Wallr. Johns), and violet rhizoctonia (Rhizoctonia crocorum (Pers. D. C.), and the pest, eelworm (Heterodera radicicola (Greef. Mul.).

Tuber Moth: Slight injury by tuber moth shall be permitted up to five per cent by weight. No tubers seriously injured by this insect shall be included.

Scab: No tubers having over 20 per cent of the surface affected by scab shall be included. Twenty per cent by weight of tubers with less than 20 per cent surface infection of scab may be permitted.

Rhizoctonia: No tubers with more than 25 per cent of surface infection shall be included. Five per cent by weight of less than 25 per cent surface infection of rhizoctonia may be permitted.

Vascular infection: Not to exceed five per cent of the tubers, as determined by transverse sections of stem end of tuber in the final tuber inspection, shall be permitted. Vascular infection shall be interpreted as meaning wilt diseases such as Fusarium oxysporum (Schlecht), Verticillium albo-atrum (Reinke and Berth).

Late blight (Phytophthora infestans (Mont. de Bary): Not to exceed two per cent of the tubers infected with late blight rot spots, and no spot to exceed one-half of an inch.

The potatoes shall be true to name, practically free from mixtures of varieties and practically true to type.

BUY POTATO SEED

The next season will prove a big one in potato planting. This is proven by the fact tbat hundreds of growers have already laid in their supply of seed, and the entire certified sweet supply has been practically exhausted. Some growers have the habit of waiting until the seed is wanted and then taking whatever the market offers. This means indifferent results and sometimes material loss because of the higher prices.

Potato growers are getting themselves organized and are in a position to make some profits for the industry.

TOP DRESSING TALKS
No. 6

Don't Waste Time and Labor!

Can you afford to be bothered by a wet lumpy fertilizer that must be crushed and screened before it can be applied?

There is a better fertilizer—one which will greatly reduce your labor of hauling and application—

ARCADIAN
Sulphate of Ammonia

Arcadian Sulphate of Ammonia has proved itself to be the most economical fertilizer on the market.

Its crop-producing power per pound nitrogen is equal to any other nitrogenous fertilizer.

It contains one-third more nitrogen than any other top dressing material. Ammonia 25¼ per cent guaranteed.

It is all soluble and quickly available but is not readily leached from the soil. Being a by-product of the American coke ovens it is the lowest priced ammoniate obtainable.

It is the fertilizer for your orchard, meadows, grain and for your truck crops. Write for our free instructive booklet.

Ask your local dealer to secure stock or order direct from the larger dealers.

Pure Bred Hog Industry Offers Big Opportunity to Young Men

In a recent issue of the Poland China Journal, Ray Moore, a representative of that journal, makes some practical observations on the opportunities offered the young man who engages in the business of producing pure bred hogs. Moore's observations are based on his personal experiences and what he says may be applied to any of the breeds of pure bred swine. Moore writes in part as follows:

"This seems primarily an age of young men. Perhaps we are discounting too heavily the experience and wisdom of maturity in all the industries and professions, but the fact remains that youth has a share in the management of the affairs of the world, never accorded it in any previous era in history. America, particularly, accords the young man special opportunities to 'make good,' and here he finds hearty cooperation, even in many cases, from the aged incumbents who are to be supplanted by successful youthful contestants. The breeding, improvement and selling of purebred hogs offers unexcelled opportunities to the live young farmer of today, and in no business will he meet with more gentlemanly competition; in no other business will he be accorded so much genuine assistance in the way of thoughtful advice, careful guidance and even financial assistance to the limit of his desserts.

"The breeding of pedigreed livestock of any kind is peculiarly a business of stability. By rights it should be begun by a young man with his faculties all clear, his ability to learn and absorb unimpaired, and should be passed from him to his sons, to whom he has imparted the knowledge gained during his lifetime in the business. The successful conduct of a herd calls for permanent improvements on the farm that are more or less useless to other farm endeavors. A breeder who devotes a lifetime to the successful conduct of a breeding herd acquires a standing in the community—a sort of conservative, broad-minded outlook on life and its complexities, which makes him one of the valued members of a community's social life.

"Indeed, there is probably no business which exerts a stronger influence upon the character of its members than does this business of growing improved livestock. The possibilities of the business are so infinite, the rewards so liberal, that perhaps the dominant influence is one of optimism. Ordinary effort is rewarded so generously that pessimism becomes almost impossible. A breeder, by the very nature of his business, by watching his animals improve from year to year, and the slow but sure improvement of the breed, comes to have a farsighted faith in the future of the race, to expect a gradual development of the human family commensurate with the improvement of his own specialty.

"Few citizens are better respected by their neighbors than the breeders of purebred swine. The consciousness of this acts as a wonderful tonic to the self respect of any man, and in the very nature of things makes him try harder to deserve such respect as his friends accord. Surely these are strong arguments for any young man to ponder before he decides against entering such a field of highclass endeavor.

"The material rewards offered are no less real than the pleasures of achievement. The future of purebred livestock improvement is destined to reach such undreamed volume, to result in such financial rewards to men who are in the game early, that no promise is too optimistic. Any young man can enter this business expecting greater rewards than his father obtained pioneering the virgin fields of the Cornbelt. The business calls for the best any man is capable of putting into it, and the rewards, both in a material way, and in the higher sense of duty well done, are such as to tempt the best men who have capacity for success in any line of endeavor.

"As I see it, we are entering upon a great transition period in American livestock production. We are passing from scrub stock, which still constitutes practically an overwhelming proportion of our present livestock population to purebred and crossbred stock. and the change is much nearer than many imagine. It is preeminently an economic change, one forced upon us by changed standards of living and changed relative values. Mounting values preclude all thought of profit under the old haphazard system of grain farming, or combination of inferior grain crops and inferior livestock. We must have increased grain production, through better seed and more intensive farming methods, and we must market this grain in its most concentrated, most valuable form, viz., highest class livestock. My 'sum up' of the outlook is that the situation justifies confidence on the part of any young man who enters the business determined to make it his profession, that he will obtain greater financial rewards, and more of that superior satisfaction which comes from a realization of good work, well done, than will come to him in any other line of endeavor. I count it my good fortune to be associated with a publication, backed by a fraternity of breeders, which will have a part in the progress which is certain to come to the breed."

Eastern Publisher Pays Tribute to Bassett & Son

C. W. Walker of Kansas City, Missouri, publisher of the Poland China Journal, visited the Poland China breeders of this state last November and in a recent issue of his paper had the following to say about the veteran breeding firm, M. & A. L. Bassett of Hanford:

"The firm of M. & A. L. Bassett, Hanford, California, stands mighty high in Poland China affairs in California—and they have a right to. Probably the oldest established herd in the state, they have a quarter of a century of square dealing and fine breeding accomplishments to their credit. The records of the county and state Poland China shows of California show this firm to be consistent and heavy winners of the best prizes. Maintaining one of the largest herds on the coast, they show a full herd each year and as a result of their winnings and methods of doing business have built up a large and loyal clientelle. For a great many years their herd was strictly of the medium type, but they are gradually changing to the bigger Polands and it is predicted it will not be long until the herd will be made up exclusively of this kind. They maintain two ranches of 160 acres each—large farms out there—and raise on an average of 500 head of hogs a year. A feature of their showing each year is the high class lot of barrows brought out by them. They cleaned up in California this year and the same barrows shown at the recent International by the University of California won fourth and fifth in the under-a-year class and were second on pen. And the International barrow show was some strong competition—if anybody happens to ask."

The Bassetts will hold a sale in conjunction with Fred D. Ross and Dr. J. A. Crawshaw, January 17, at which time the three herds will contribute 60 head of bred sows and gilts that will be the equal of any ever sold from those herds.

It will be remembered that last spring announcement was made of the organization of an association by the Fresno district Duroc-Jersey breeders at which time J. W. Schmitz, Madera, was made president and H. H. Bereton, Sanger, secretary. They will hold their first public sale in Fresno, February 4, at which time they will offer 40 selected bred sows and gilts.

Epoch Making Duroc Sale

Sows Bred to Grand Champion Boars

ACE OF PATHFINDERS

Grand Champion 1919

This great boar was the sensation of the Los Angeles Livestock Show, 1919, winning the Grand Championship. Besides, he stood second only to the world's champion, Great Orion Sensation, at the 1919 National Swine Show. Sows and gilts bred to this wonderful son of Pathfinder will strengthen any herd.

MAMMOTH SENSATION JR.

Grand Champion 1919

The largest junior yearling shown at the California State Fair in 1919, winning first in his class and Reserve Grand Championship. He is the greatest son of Mammoth Sensation, the largest two-year-old boar that ever lived. Sows bred to this boar will insure you the big-type Durocs that everybody is clamoring for.

DIAMOND

DIAMOND

PLAN TO ATTEND

Here is the opportunity of a lifetime to secure big, roomy, motherly sows and gilts sired by the breed's most noted boars and bred to our super-sires. They are safe with pig for spring litters and all ready to go on and make a fortune for you.

Public Sale

40 SOWS AND GILTS

Wednesday, January 28

At this great sale you will find the utmost in Durocs—sows and gilts with strong backs, great stretch, well-sprung ribs, heavy bone and good feet. They are the fast-growing, easy-feeding kind with worlds of quality. Buy them and reap a golden harvest.

CHOLERA IMMUNE

DIAMOND

DIAMOND

California Great Wonder Grand Champion 1918

This undisputed Champion of 1918 stands today without doubt the greatest wonder sire on the Pacific Coast. He has sired some of the largest pigs for their age we have ever seen. At the Los Angeles Show his six-months' pigs averaged 226 lbs. If you want fast-growing qualities get sows bred to him.

Great Sensation 2d Winner in Class 1919

Here is a wonderful pig for his age, and a future champion. He won wherever shown and was defeated only by much older boars. He is a grandson of Great Wonder I Am, the largest boar that ever lived. We consider him one of our most valuable boars, and are breeding only a few sows to him.

Ranch is located 28 miles east of Los Angeles and four miles west of Pomona on the Valley Boulevard. Several auto stage lines pass the gate. See next week's advertisement for complete directions.

Delco-Light Life Plant
Started March 15 1917
Torn down October 31 - 1917
Number hours run 5,370
Cost to put plant in first class condition including labor and parts $28.90
12,000 hours service March 12 1919
Cost of overhauling at this time $25.80
July 15 1919 necessary repairs $8.50
TOTALS $63.20
Number hours run up to October 18 - 1919 — 13,875
Figuring on the basis that 10 hours per week represents average use of plant the total number hours represents better than 26 years, actual service.

This is an actual photograph, taken in the final test department at the Delco-Light factory.

TWO DUROC-JERSEY SALES NEXT WEEK

The spring series of Duroc-Jersey sales will be started next week when the California Duroc-Jersey Breeders Association will hold their first annual sale at the university farm, Davis, January 14. The following day Harvey M. Berglund of Dixon will hold his first sale. The two sales will afford an opportunity for those interested in Durocs to make selections from a number of varied lines of breeding that have proven sources of desirable stock. In the association sale 40 bred sows and gilts will be representative of the leading herds of this state. Many of them are sired by prize winning boars and not a few of them have been seen in California show rings themselves. The Berglund sale will consist of around 35 head and will include 25 bred sows and gilts, seven open gilts and three young boars. Few spring sales will contain any boars.

Men interested in the breed are urged by the breeders to attend the two sales and get acquainted with the men who are promoting the breed in this state. The members of the association feel that the extension of the breed on this coast is largely a matter of cooperation and that cooperation is dependent upon all breeders working together.

GATEWOOD TO RETIRE FROM POLAND RANKS

Poland China breeders in general are expressing keen regret over the fact that Chas. Gatewood of Fresno has found it necessary to retire from the breeding business. Mr. Gatewood is one of the pioneer breeders of this state and his herd has been responsible for the production of many of the best Polands brought out in recent years. At the 1919 state fair Giant Bob, a junior yearling son of the noted National Swine Show champion, Caldwell's Big Bob, developed and shown by Mr. Gatewood was made grand champion. Giant Bob is easily one of the best Poland China boars developed in this state. In a recent issue of 'the Poland China Journal, C. W. Walker, the publisher, commented as follows on Giant Bob. "This junior yearling son of the 1917 world's champion is unquestionably one of the best junior yearling boars brought out this year. He would have been a strong contender in the more hotly contested shows of the Cornbelt." This boar, along with the complete herd of sows will be sold at public auction at Fresno, January 26. Geo. W. Bell of Tulare will be the auctioneer.

DAIRY DIVISION OF SONOMA COUNTY FARM BUREAU

The organization of the dairy division of the Sonoma County farm bureau was perfected with the selection of the following officers: Director, J. R. Gallagher, Bodega; vice director, Arthur Purvine, Two Rock; executive committee, E. Seinbach, Two Rock; M. A. Luce, Santa Rosa; S. Gambonini, Lakeville, and Arthur Le Baron, Valley Ford.

Mr. Greene is kept busy with such meetings as these in the work of the California dairy council. Calls for his services are coming into the office of the council at 268 Market Street, San Francisco, faster than he can attend to them.

CALIFORNIA LIVESTOCK FOR GUAM

Glenn Briggs, agronomist for the agricultural experiment station, department of agriculture, Island of Guam, recently visited California breeders and selected a number of Berkshire boars and Ayrshire bulls for distribution among the native farmers of that island. Included in the shipment were six young boars selected from the Castleview herd, Santa Rosa, and 12 from the herd of Frank B. Anderson, Sacramento. E. B. McFarland of the Steybrae Farm, San Mateo, furnished two young Ayrshire bulls. According to Briggs this initial shipment is by way of an experiment but if the venture proves satisfactory it is expected that further shipments of the various breeds will be made from time to time, and of course California breeders will be called upon to supply the trade.

A Business Proposition, Mr Hog Raiser!

First Annual Bred Sow Sale

California Duroc-Jersey Breeder's Association

University Farm, Davis, Calif., Wednesday, Jan. 14.

40 High Class Bred Sows and Gilts 40

What We Offer In this, the initial sale of the official state organization, for the promotion of the Duroc-Jersey, it is but natural that the character of the offering be such as to reflect the greatest credit upon the breed. Accordingly, the leading herds of the state have been drawn upon to furnish a quality such as has never before been offered California buyers.

The offering includes bred sows and gilts carrying the demonstrated blood lines, and every animal is bred to or is sired by a boar that stands in the front rank.

In the pure bred livestock industry nothing is more certain than this fact: The best can only be produced from the best and the fact that the California Duroc-Jersey Breeders' Association stands back of this offering is proof that the entire lot is right and reliable.

The Test The practical test of the value of any farm animal is—"Does it pay to produce that animal on the farm? Is that animal profitable?" Whatever may be its good qualities or uses, the animal must make profit before the farmer will accept it.

The Proof The great American Farmer has placed his stamp of approval on Duroc-Jerseys and made them the most popular of all breeds of swine. Duroc-Jerseys could not have gained and held secure this enviable position if they did not produce pork at a profit. The profit in breeding Duroc-Jerseys is the basis of this universal popularity.

The Reason Durocs are prolific—Durocs mature rapidly—Durocs feed economically—Durocs breed uniformity in size, type, conformation and color—Durocs outnumber any other breed.

Grow Durocs - - - Grow Independent

An Opportunity. This sale furnishes an opportunity to buy a foundation herd of sows that will not only increase your pork profits, but will add to the pleasure of your feeding operations.

You can attend this sale with the greatest confidence and feel certain that the offering represents the best to be found in California. Come to the university farm and meet the men who are producing Durocs.

Shropshire Sheep

Geo. A. Stingle, Berkshire breeder of El Monte, has just purchased a young boar from E. J. Barker's herd at Thorntown, Indiana. This boar is sired by Real Type, one of the largest, if not the largest boar of the breed. Mr. Stingle has sold his senior herd boar, Master Gabriel, a grandson of Masterpiece to J. C. Biedebach of Pasadena and a young boar sired by Master Gabriel to J. H. L. Vogt of San Diego.

Dr. M. Creamer, owner of Ireland Ranch, will, in conjunction with Donald Graham and E. Avery Newton, hold a sale of Duroc-Jerseys on Ireland Ranch near Owensmouth, January 30. The sale will consist of 40 bred sows and gilts including four daughters of Reformer, a sire well known to all Duroc-Jersey breeders. Mr. Graham will sell four daughters of Orion King Gano while Mr. Newton sells six daughters of Crimson Col. Dr. Creamer in speaking of the sale states that for the past eight months he has had this sale in mind and has been reserving the animals to be sold, which will include several sows by Reformer.

Saturday, January 17, in Hanford, Bassett, Crawshaw and Ross will hold their next sale of Poland Chinas. Sixty head will be sold, mostly bred sows and gilts, and these will be bred to such boars as Big Timm, King's Gerstdale Jones, Some Price, King's Timm and Model Fellow Jr. In the past these sales have attracted buyers over a wide range and no doubt this sale will have ample support.

The next sale of Hale I. Marsh, Modesto, breeder of big type Poland Chinas, will be held on his farm six miles north of Modesto, January 28. Mr. Marsh is building a new circular farrowing house and the sale will be held in this, which assumes comfort in case the day should prove disagreeable. He will sell 30 young sows that have had their first litter and about ten proven sows mostly senior yearlings. Mr. Marsh states that they are all well grown out and will have plenty of size for age.

Developments on Diamond Bar Ranch, Spadra, will afford considerable interest to those attending their sale of Duroc-Jerseys, January 28. Some 800 hogs are fed twice daily and the automatic feeding system will probably be in operation by that time. That the blood lines of the animals to be sold in the sale are popular is shown by the requests for catalog over a wide range of territory. As this is their initial sale care has been used in making the selections and the matings have been made along the lines of individual merit and type. Arrangements have been made for housing a large crowd, so regardless of weather conditions those in attendance will be comfortable.

Tulare County has a new Poland China breeder in Z. M. Dickey whose ranch is near Dinuba. He has recently added a Poland China boar sired by Blue Valley Big Bone and his dam is Miss Big Bone Bob. The youngster has good stretch, big bone and straight legs. Mr. Dickey has also acquired a gilt by the 1918 world's champion Black Price.

Frank B. Anderson, Berkshire breeder of Sacramento, has recently established a small herd of registered Holsteins and the herd will be conducted under the name of Anderson & Fogarty. Fogarty was formerly connected with the dairy division of the university farm, Davis, and is an experienced dairy cattle and hog man.

W. S. Guilford of the Butte City Ranch has returned from an extended trip through the East where he visited many of the leading herds and flocks. Guilford made numerous purchases of Shropshire sheep from the leading flocks but says that he visited very few establishments that were producing a better quality of stock than will be found on the ranches of this state. It is the opinion of Guilford that the time is not distant when Eastern breeders will come to this state for breeding material. Guilford found that there is a general demand for size in breeding stock and he believes that because of the favorable growing climate of this state that more size for age can be produced in coast herds than in any other section.

Wm. Bond, Shorthorn breeder of Newark, calls attention to the fact that Roan Duchess H, grand champion milking Shorthorn female, shown by Thos. Harrison of Santa Rosa at the recent Pacific International Livestock Exposition, Portland, was bred at the Bond farm. Roan Duchess H was sired by Pacheco Lad 46th, a son of the Pacheco herd bull, True Dale, and her dam was Duchess Knight, a granddaughter of March Knight.

In a report just issued by H. E. Allen of the American Hereford Breeders' Association it is stated that 1,070 new members were added to the association, making a total membership of more than 11,000 breeders. Registrations for the year reached the total of 96,873 and 85,384 transfers were made on the books of the association. During the 11 months ending December 1, 1919, the cattle offered at public sales sold for more than $8,000,000 and averaged over $490 per lot.

The California Shorthorn Breeders Association will hold their annual spring sale February 26, during the proposed Livestock Week at the university farm, Davis. The offering will include a choice lot of females and a particularly desirable lot of young bulls of a quality to meet the needs of the breeder or the range operator. These association sales have served a highly useful purpose by making it possible for purchasers to select carefully chosen stock from the leading herds of this state and it is anticipated that the forthcoming sale will present an offering the superior of any yet sponsored by the association.

The California State Poland China Breeders Association plans a sale to be held at the university farm, Davis the morning of February 26. Secre

LES McCRACKENS

POLAND CHINA SALE

King's Big Bone Leader

I consider King's Big Bone Leader one of the greatest Poland China sires of the breed today. A champion and grand champion he has plenty of length and depth, a strong arched back and big bone. He imparts all these good qualities to his get. Go into any herd and you will usually find some of the outstanding animals are by King's Big Bone Leader. At the sales where anything by him has been sold it usually sells away above the average. This in itself should be convincing proof to the careful buyer that a litter by King's Big Bone Leader will give entire satisfaction and return a nice profit.

His Running Mate

I have selected, as a mate for King's Big Bone Leader, Giant Bob 2d, by Giant Bob, the 1919 grand champion boar. In Giant Bob 2nd I have a boar with a future that no one discounts. He is just such a boar as you would like to have in your own herd. I believe this young boar has a great future and will mate well with the daughters of King's Big Bone Leader.

My Herd

My herd now contains eighty-five sows and gilts of breeding age. Part of these I bred and part have been selected from a number of the good herds to be found in the state. They have been selected not only because of their blood lines but on account of their individual merit as well. I am putting into this sale a choice selection from the herd and I believe, after you have seen them, that you will agree with me that I am offering you a grand lot from which to choose.

The Date of the Sale:

The sale will be held on the farm, one mile north of

Ripon, Cal., Thursday, Jan. 29, 1920

Ample protection afforded against bad weather

Lunch at 11 A.M. *Sale Starts Promptly at 12.30 P.M.*

The Offering:

50 Poland China Sows and Gilts Bred to King's Big Bone Leader and Giant Bob 2nd

A Study of the Breeding
of the animals in the sale will be of interest. The sows and gilts are by such noted boars as: Blue Valley Tecumseh, Young Jumbo, King's Big Bone Leader, Giant Bob, Joe's King, Model Major, I B A Wonder, California Wonder, Caldwell's Big Bob.

Of Special Interest
will be the sale of a Caldwell's Big Bob sow bred to King's Big Bone Leader. This sow was first prize senior yearling at the last state fair. A first prize winner bred to a grand champion boar.

? What Will the Litter Be Worth ?
Write immediately for the catalog and study the breeding of the animals listed to sell. It will be interesting reading.

I Want the Farmer to Attend

I extend to every farmer and dairyman a special invitation to attend my sale. I think you will be pleased with my offering and I want your friendship in building up a great herd of Poland Chinas. I want you to come whether you buy or not as I want you to see what kind of hogs I am raising.

Everybody Come *Write for Catalog*

H. P. Slocum and Son
Willows, California

Breeders of Duroc-Jerseys. The Key Herd of the Pacific Coast.

tary McCarty says that the offering is not only planned to present the merits of the breed but the sale will furnish an outlet for the smaller breeders who are not producing stock on a scale that will permit them to hold their own sale. The members of the state association have mapped out a constructive campaign for the welfare of the breed, and the sale is but one way that the established breeders propose to make the business attractive. About 50 head of high class sows and gilts will be sold.

V. F. Dolcini, proprietor of the June Acres Stock Farm, Davis, has sold his young Holstein bull, Sir Aaggie Korndyke Mead, to C. L. Goodin, Derby, Kansas, for $3,500. Sir Aaggie Korndyke Mead was bred by A. W. Morris & Sons, Woodland, and was sired by Sir Aaggie De Kol Acme and is out of Lady Mead Salambo, a daughter of King Mead of Riverside, with a record of 950.01 pounds butter. She in turn is a daughter of Pet Salambo of Riverside, a 1,003.28 pound cow. Five of the seven nearest dams of Sir Aaggie Korndyke Mead have an average yearly production of 1,096.28 pounds butter in a year. Through the sire the Dolcini bull is a half brother to Sir Aaggie Mead De Kol, sold last summer in the Philadelphia sale for $11,000. These two bulls are the first to be sold by California breeders to Eastern buyers and their sale is evidence of the keen interest that the East is manifesting in California livestock of all kinds.

A. W. Morris & Sons, Woodland, have just made a notable sale of a two months old bull calf to Elmer Axelson of Mt. Vernon, Washington. The youngster was sired by Sir Aaggie De Kol Mead and is out of a daughter of Sir Aaggie De Kol Acme that has just completed a junior two year old record of over 21 pounds butter in seven days. The price received is said to be the highest ever paid in this state for a calf of that age.

Edward Cebrian, proprietor of the Caledonia herd of Shorthorns maintained near West Sacramento, has announced the purchase in England of the famous thoroughbred stallion, Troutdeck. Troutdeck was secured from the Duke of Westminster for $30,000. Cebrian maintains his thoroughbred establishment, Mira Monte, near San Jose.

A fire which destroyed the calf barn at the Palo Alto Stock Farm, Palo Alto, caused the loss of 53 head of Holstein and Guernsey calves valued at $25,000. The origin of the fire is not known.

H. M. Elberg, Woodland, owner of the Roselawn herd of Shorthorns, has returned from the East where, accompanied by his herdsman, Carl Johnson, he selected 11 head of high class females, all of Scotch breeding. One was secured in the International Sale and the balance come from the Hopley herd at Alantic, Iowa. From the latter herd come seven head bred to the great bull, Village Beau, counted one of the best sons of Villager.

Butte City Ranch, Butte City, reports the arrival of the Shetland stallion, General Boggs, purchased from J. C. Thompson of Jamaica, Iowa. General Boggs, a winner at the Iowa state fair, was sired by Grandee, the famous son of Prince of Wales—the two greatest ponies ever developed in the breed.

In the opinion of a great many Poland China breeders in no sale this year will there be offered a better lot than will be found in the sale of H. D. McCune which will be held in Hanford, January 24. Mr. McCune has an established reputation for properly growing out and developing his animals before offering them for sale and his consignments to past sales of the Kings County Poland China Breeders Association verify these facts. This will be his first public sale and as a special attraction he is offering a young boar and a gilt by Surprise Prospect and out of Edith Rose that are litter mates to the gilt that sold for $1,250 in the last consignment sale.

Pure Bred Registered Jerseys

At the Arden Dairy, one mile north of

EL MONTE

Friday, January 23rd at 10 A. M.

The Arden Dairy is offering on this date an exceptionally good herd of pure bred, registered Jerseys. They are young, in first class condition and combine type and production. Practically all of the females are sired by either Noble's Mayfair Hero 122139 by a son of Noble of Oaklands 95700 or Kathie's Eminent 115265 whose dam Eminent Kathie 271870 was a wonderful show cow. First prize at Murfresboro Fair, 1915, her sire being Eminent's Stockwell 79785, a show bull never defeated and he being out of an imported cow and by Imp. Stockwell 75264 who sold for $11,500 and sired 5 R. O. M. daughters. The two above mentioned bulls together with ten others from calves up to bulls old enough for service will also be sold.

This is a large sale of high class registered Jerseys, tuberculin tested and the kind that will make money for the buyers. It will pay you to attend.

Dispersal of Choice Holsteins

Owned by

C. F. Mohnike, Angiola, Tulare, Cal.

(on the old DIXIE RANCH)

Friday, January 30, 1920

This is one of the most attractive looking herds we have ever sold. While no official testing has been done in the herd the blood lines are substantial, and buyers should secure excellent values on sale day. The herd contains

45 --- Registered Holstein Cows, Heifers and Bulls --- 45

20 --- High Grade Holstein Cows and Heifers ---20

The herd sire is CREAMCUP FIDESSA CORNUCOPIA LAD, who is by a son of the 33.53 pound cow Fidessa Bloom. His dam is Anselogess of Sleepy Hollow, 32.68 pounds butter in 7 days, 897.08 pounds butter from 22751.7 pounds milk in one year. His dam and sire's dam average 33.10 pounds butter in 7 days. He is a high class individual in every respect, his calves are of high quality, and he merits consideration from owners of good registered herds. He will be sold, together with 11 of his young daughters, and all bred females in the sale are in calf to him.

A daughter of Juliana King of Riverside, two grand daughters of Ignaro De Kol, a daughter of Anselmo, and a grand daughter of De Kol 2nd's Butter Boy 3d are among the females to be sold.

Besides the herd sire there are a number of young bulls that should find places at the head of high class dairy herds.

This herd as a whole is above the average in type, and the cattle are in good physical condition.

Every animal guaranteed to be a breeder; no animal tuberculin tested.

We will also sell 30 Poland China feeder hogs, two teams of good mares, and one new No. 17 De Laval separator with 1 h. p. motor.

NEW COAST RECORD IN HOLLYWOOD HERD

A new Pacific Coast record for seven day butter production was lately made at Hollywood Farm, Hollywood, Washington, by the registered Holstein cow Hollywood Lilith Mercena, who at last report has 49.88 pounds butter from 726.4 pounds milk to her credit. This is also the third highest in the world according to the present status of seven day records. This cow has been a consistent producer from her first freshening, making 19.76 pounds butter in seven days as a junior two year old, 33.44 pounds in seven days as a junior three year old, and 49.88 pounds as a five year old. She is out of the 28 pound cow Hollywood Mercena, and is sired by Hollywood Lilith Palmyra, who is by King Palmyra Fayne, a son of King Fayne Segis, and out of a 32 pound dam that made 1,077.21 pounds butter from 26,135 pounds milk in one year. Mr. Fred S. Stimson, owner of Hollywood Farm, should derive a large measure of satisfaction from the fact that Hollywood Lilith Mercena, her sire, and her dam, were all bred at Hollywood Farm. It is reported that the great record maker and her son by Judge Segis will sell in the National Sale at St. Paul next June. A half sister to Hollywood Lilith Mercena, by the same sire but out of a granddaughter of Pontiac Korndyke, is owned by W. J. Higdon, Tulare.

SHORTHORN REGISTRATION FEE INCREASED

The board of directors of the American Shorthorn Breeders' Association, at the December 4th meeting, voted to increase the registration fee to $2.50 after January 10, 1920. This increase is necessary to meet the present cost of operations and in order to provide for the appropriations for Shorthorn prizes and meet the demand for extension work. The Shorthorn Association has been progressive and discreet. A broad foundation has been laid and is being laid for the growth of the breed in the future. Immediate results are in evidence in all sections. A greater demand exists today for Shorthorn cattle than ever in the history of the breed. The campaign of education which the Shorthorn Association has conducted has played no small part in the development of this demand. These are great days for Shorthorn breeders yet the prospect is that greater days lie just ahead. The policy of the association to use the income in the interests of the breeders generally in the expanding of Shorthorn influence and in the creating of Shorthorn sentiment based on practical utility has been an effective and useful one. Certainly any plan that will enable a more energetic and decisive effort along these lines will further stimulate the trade and encourage the industry.

ASSOCIATION HEREFORD BOOKLET

A most attractive booklet that should be of great benefit to the breed is one recently published by the American Hereford Cattle Breeders' Association, Kansas City, Missouri. The purpose of the publication, as set forth in the introduction, is to furnish information to interested parties, particularly farmers and prospective breeders.

On the front cover is a head cut in colors, a Hereford bull, and the back cover is a study in contrast showing an old time Texas longhorn and a purebred Hereford bull of the approved type. Illustrations throughout the book are designed to give the breeder the right idea of Hereford type and the possibilities in breeding Whitefaces. Data is given concerning the beef cattle situation and the purebred Hereford business, and to this is added advice and suggestions from some of the foremost Hereford breeders. It is a booklet that will be of great value to the man just starting in the breeding business as well as to the breeder of wide experience. The association will be glad to send copies upon application.

COW TESTING FORETELLS PROFITS IN DAIRYING

Tests conducted at the Ohio experiment station show that only about three hours time a year is required to determine the amount of milk and fat production of a cow.

The station points out that many tests of a cow's ability are required, for there are variations of both quality and quantity of the cow's milk from time to time. The weighing and testing of a single milking gives no reliable idea of the cow's productive ability, so that monthly records are required to determine the correct data.

Weighing scales and a common milk tester, which costs from $10 to $15, are practically the only materials needed to determine the data.

It is pointed out that the tests are also of value as a guide to proper feeding as well as locating low producing cows in the herd. This makes it possible to give extra feed to a heavy producer during the early part of the milking period, while a small producer would require less feed.

The old idea that high producers are unprofitable because of more exacting requirements in food and care is causing a loss to many dairy farmers, it is said.

Where a farmer determines the cow's ability to consume and make proper use of food beyond the maintenance requirements, it is quite possible to determine the exact value of the cow for dairy purposes.

AIDING THE SMALL BREEDER

There are many men in this state who would undoubtedly like to enter the pure bred livestock business but who feel that owing to their small capital they can not operate on a scale sufficient to provide a market for their surplus. Such men have the idea that the small breeder is shut off from the good markets and that only the man who is producing enough animals to hold his own sale or to justify considerable advertising can make the business pay.

The above condition has been recognized by the promoters of the various breeds and with few exceptions each breed now has the benefit of a state association organized for the furtherance of the breed and to assist the beginner and the small operator in disposing of his sale stuff.

For example the Holstein, Shorthorn, Hereford and several breeds of swine are backed by live organizations whose members and officers sponsor consignment sales.

During the past year there have been held a number of consignment sales for the different breeds, and for the most part these sales have been among the most successful. No breeder is operating on too small a scale to avail himself of the benefits of such sales. If he has well bred stock and has developed it properly he can consign with as great assurance that his offering will bring full value as the older established breeders. The buying public looks for merit and is willing to pay for it and values are established on the basis of worth rather than on the reputation of the man. Very often the top prices registered in association sales are secured by small breeders. It is quite possible that the man with but a few head is in a position to present his offering in better condition than the larger breeder for the reason that he is able to give his small herd more attention and care. And if when starting he has been careful to select the right type backed by proven blood lines there is no real reason why he can not attract the best custom.

Nearly all of the national breed associations have adopted broad and constructive plans for aiding the beginner and the small breeder in finding a market for his surplus for the reason that it is recognized that the strength of a breed depends largely upon the number of men engaged in the business and that if men are to be attracted to the business it is necessary that the business be made profitable through an active demand.

There never was a time in history when pure bred livestock of all kinds received more attention than now. The efficiency of pure bred livestock has been conclusively proven. There is no danger of an oversupply, and with a constantly widening market and national, state and local organiza-

Her Health Was Not Left to Chance

The cows that make the big milk records are well fed and well bred, to be sure. But, above all, they are in the pink of condition. The constant strain of heavy milk production will wear down the vitality of the digestive and genital organs of the best of cows, and the result is such ailments as Abortion, Retained Afterbirth, Barrenness, Scouring, Bunches and Milk Fever. Any of these diseases can be successfully treated and eliminated with KOW-KURE, the great cow medicine. The medicinal properties of this famous remedy act directly on the organs of production and reproduction, putting the cow's system back to normal, healthy action. A decided increase in the milk yield is sure to follow. Feed dealers and druggists sell KOW-KURE; 60c and $1.20 packages.

Consider cow-health first, and your dairy will be a leader, and a money-maker. Our free treatise,

"THE HOME COW DOCTOR,"

will give you valuable pointers on how to treat and prevent cow diseases. Ask for your copy,

Dairy Association Co.,
Lyndonville, Vermont

KOW-KURE

Health Pays!

This perfect three-year-old Jersey has a yearly milk record of 17,793 lbs. Nothing short of 100% health would make such a record possible.

tions lending every aid, any man can enter the business with confidence that he can dispose of his surplus at sound values in keeping with the quality he is producing.—R. P. R.

UNIVERSITY TESTS SHOW HIGH RECORD FOR COWS

High monthly records of pure bred cows on semi official tests were today made known by the University of California college of agriculture supervisor of advance registry tests.

Fairy's Last, Cretesia M. A.'s Frankie and Lily of S. B., Jerseys, owned by F. W. Elleby, aged nine years five months, nine years four months and ten years 11 months, produced respectively 66.09, 93.38 and 59.46 pounds butter fat, and 1,201.7, 1,083.5 and 1,152.3 pounds milk.

Flossie De Kol of Nevada, Miss Aaggie Acme Burke, owner by A. W. Morris & Sons, and K. P. Tola Joe, Holsteins, owned by Gotshall & Magruder, five years two months, two years four months and five years one month, produced respectively 88.981, 77.981 and 73.51 pounds butter fat and 2,704.6, 2,217.5 and 2,070.7 pounds milk.

Imp. Dosia of Sarnia, owned by A. B. Humphrey, and Little Beauty 2nd and Silvia of Frankland, Guernseys, owned by Elliott-Brant Rancho, all three years, produced respectively 61.86, 58.65 and 47.06 pounds butter fat and 1,212.9, 1,339 and 980.5 pounds milk.

LICE ARE EXPENSIVE

Lice on hogs are extremely expensive. Lousy hogs not only consume more food and make less meat but are uneasy and restless, a condition that lessens their pork producing abilities. When not eating the lice ridden swine spend most of their time rubbing themselves or running around.

In one experiment it cost exactly $1 a hundred pounds of pork more to feed hogs with lice than it did to feed clean animals. In another, it cost $1.50 more, and in the third, $2.94 more. But the lice ridden hogs can not make up for the blood sucked by their parasites. For instance, at the beginning of one experiment 15 hogs with lice weighed a total of 1,167 pounds, and 15 hogs without lice weighed 1,025 pounds. At the end of the experiment the lousy hogs weighed 2,872 pounds and the clean hogs weighed 3,150 pounds, although the total feed consumed by the clean hogs weighed only 203 pounds more than that eaten by the animals with lice.

THE ART OF JUDGING STOCK

The art of judging is the foundation of all beef cattle shows and is also largely the means of determining the value of cattle offered in public sales, says Farmers' Bulletin No. 1068, "Judging Beef Cattle," recently issued by the United States department of agriculture. Each breeder, therefore, to attain success in his line must be a good judge so that he can select and mate individuals to get the best possible offspring. A thorough knowledg of judging feeders, for example, is important since profit in cattle feeding usually depends upon buying animals of the right type. Without definite standards stock judging can not be successful.

The Bulletin mentioned takes up in detail various phases of judging, together with an easily understood discussion of the various types of animals and the method of scoring them. It may be had free on application.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal. Unsigned communications receive no attention.

Chronic Lymphangitis

We have a large work mule on our place that has a big hind leg. It is as big as a six inch stove pipe way up to the gambrel joint and when worked hard it swells clear up to the body. Would you advise using caustic balsam or a rowel to cure him? We bought him very recently in a six mule team and have no idea how he came by the big leg. Would like to treat him if you think it will do any good. —Subscriber, Coachella.

The lymphatic glands have become inflamed and are not carrying off the worn out material so it is left in the tissues to swell out the skin. Those old chronic cases are slow to yield to treatment and you will have to have some patience and not give it up when you see that the first few doses do not make much change. By carefully following these directions you may be able to reduce it nearly to its normal size. Laxative feed will help. Feed very little grain although he must have enough to keep him up while working. Give him a feed of carrots once a day if you can get them. Give him a tablespoon of nitrate of potash in the feed once a day for ten days. Then have your druggist dissolve two ounces of iodide of potash in a pint of water. Give a tablespoon of the solution on the feed once a day while it lasts, which will be about a month. Do not apply the strong liniment that you suggest nor any other strong medicine to the leg. Brush the leg with a good stiff brush morning and evening and every evening apply the following lotion: Dissolve one ounce of the chloride of zinc in a gallon of soft water. Use rain water and boil and strain it. Use a gallon bottle for the solution. Every evening warm about a quart of the solution in a granite or earthen dish and after brushing the leg clean apply the lotion, rubbing it in well with the hands. This treatment may seem too mild to suit you but if you keep it up for some time you will probably feel paid for the trouble. Better get several one ounce bottles of the chloride of zinc. It is not expensive.

Dog with Skin Disease

We have a female Pekinese poodle that has something wrong with the skin. She rubs and scratches constantly and the irritation seems to be on the back near the tail. Have had her at a dog hospital for a week and have tried resinol ointment but she is no better. Please advise us what to do.—Subscriber, Los Angeles.

We take it for granted that the little dog is kept free from mites but even with the best of care they will sometimes get a start so would advise thorough scrubbing with tar soap. (Never use carbolic acid about a dog; it is more poisonous to dogs than any other animals.) When the skin is dry anoint it with oxide of zinc ointment which you can get from your druggist. The real trouble is probably caused by overfeeding of meat and sweetmeats. Dogs should not have cooked meat nor sweets of any kind. The dog's natural food is raw meat. Feed a little raw liver once a day or give her beef bones with a very little meat on so she will have to earn what she gets. A small dish of milk once a day is also good. A physic of salt will be good to start with but the bowels should be kept free by feeding lightly and of such food as suggested. Would also advise giving Fowler's solution of arsenic. Give two drops on the tongue or in a little milk once a day. It is good for skin troubles.

Make Your Milkers Pay

Good Health—Good Appetite—and Good Digestion are the essentials of a good milker.

Dr. Hess Stock Tonic promotes health—makes cows hungry. Remember, it takes a healthy, hungry cow to convert a big mess into pails of milk day after day.

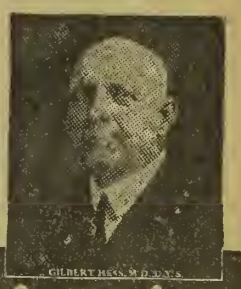
Dr. Hess Stock Tonic produces appetite, aids digestion, conditions a cow to stand the stuffing, cramming process necessary for heavy milking. Dr. Hess Stock Tonic contains the salts of Iron that supply rich red blood so necessary to cows in milk. It contains Laxatives and Diuretics that assist the kidneys and bowels to throw off and carry off the poisonous waste materials that so often clog up the system during heavy feeding.

Dr. Hess Stock Tonic

Ever notice a cow slack up on her milk—not quite so keen for her mess—apparently not sick? Her system is clogged. This never occurs where Dr. Hess Stock Tonic is fed. Start right—by conditioning your cows for calving with a course of Dr. Hess Stock Tonic before freshing.

There is not a day during lactation that Dr. Hess Stock Tonic cannot be fed to cows at a profit. This is especially true where heavy feeding is the practice. Dr. Hess Stock Tonic is good alike for cattle, horses, hogs and sheep. It makes the ailing animals healthy, the whole herd thrifty. It expels worms.

IMPORTANT: Always buy Dr. Hess Stock Tonic according to the size of your herd—five pounds for each cow to start with. Get it from the responsible dealer in your town. Feed as directed and note the results in the milk pail.



25-lb. Pail, $2.50; 100-lb. Drum, $8.00

Except in Canada.

Smaller packages in proportion.

HARDIE SPRAYERS

High pressure, light weight, large capacity, powerful engine, perfect agitation, simple construction.

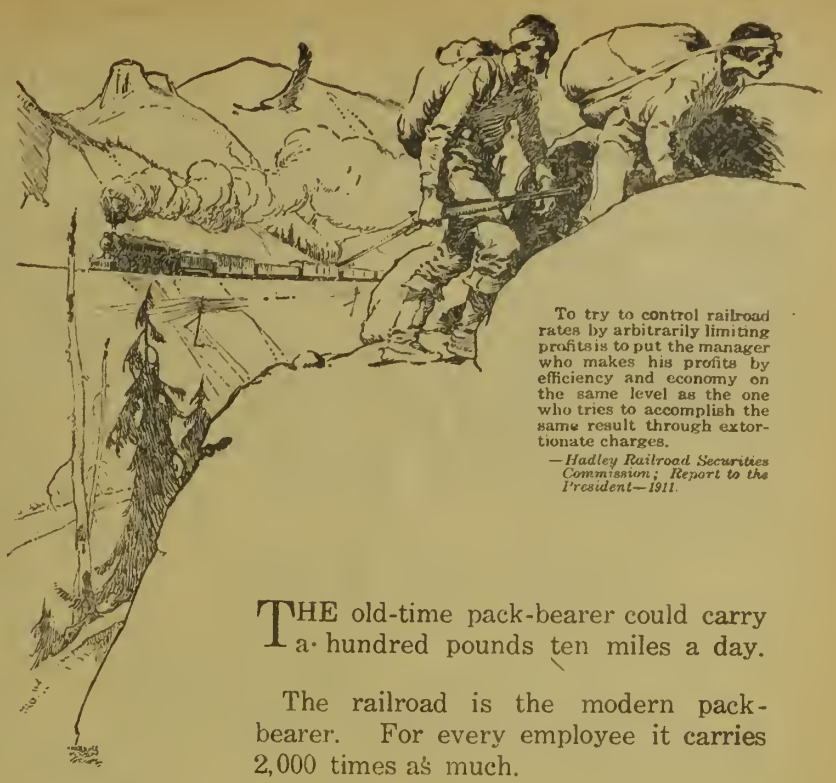
HARDIE Power Sprayers are the final word in sprayers. They represent not only years of experience, but also an accurate knowledge of spraying needs and the conditions that govern spraying. Where spraying is most difficult you will find **HARDIE** Sprayers in the majority.

HARDIE SPRAYERS are noted for their simplicity. No complicated devices to cause trouble when every minute counts. You can put any of the help to work with a **HARDIE** and get maximum results. Makes the work of spraying easier than ever before.

When you see a **HARDIE SPRAYER** you will readily understand its superiority. See how compact it is—the few working parts and how every one of them is quickly accessible. There are 21 **HARDIE** features that make it the leading power sprayer. The **HARDIE CATALOG** tells all about them. A **COPY** is yours for the asking. Send today. You can see a **HARDIE** at your dealer's.

The HARDIE MANUFACTURING COMPANY

224 N. Los Angeles St. Los Angeles, Calif.



To try to control railroad rates by arbitrarily limiting profits is to put the manager who makes his profits by efficiency and economy on the same level as the one who tries to accomplish the same result through extortionate charges.

—*Hadley Railroad Securities Commission; Report to the President—1911.*

THE old-time pack-bearer could carry a hundred pounds ten miles a day.

The railroad is the modern pack-bearer. For every employee it carries 2,000 times as much.

Back of each railroad worker there is a $10,000 investment in tracks and trains and terminals, with steam and electricity harnessed like a great beast of burden.

Without this mighty transportation machine the railroad worker could do no more than the old-time packer. But with it he is enabled to earn the highest railroad wages paid in the world, while the country gains the lowest-cost transportation in the world.

The modern railroad does as much work for half a cent as the pack-bearer could do for a full day's pay.

The investment of capital in transportation and other industries increases production, spreads prosperity and advances civilization.

To enlarge our railroads so that they may keep pace with the Nation's increasing production, to improve them so that freight may be hauled with less and less human effort—a constant stream of new capital needs to be attracted.

Under wise public regulation the growth of railroads will be stimulated, the country will be adequately and economically served, labor will receive its full share of the fruits of good management, and investors will be fairly rewarded.

This advertisement is published by the Association of Railway Executives

Those desiring information concerning the railroad situation may obtain literature by writing to The Association of Railway Executives, 61 Broadway, New York

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property.

Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops will bring good prices next year, so take advantage of this condition and get your land under cultivation now.

Write today, stating location of land and number of acres.

Heart to Heart Talk with Beginners

By Jean A. Koethen

ADVICE to beginners is handed out in such generous doses by writers and speakers alike that I hesitate to add my mite to the already immense stock on hand. Advice is worth just what it costs and is usually accepted at its face value. It is only because I have not forgotten my own costly and precipitate beginning that I dare to venture.

It seems to me nine-tenths of all shipwrecks in poultry work are due to a failure to visualize the fundamentals of poultry husbandry. The novice, seeing the great numbers of eggs offered for sale concludes that hens, being hens, must lay and lay profitably under any and all conditions. It is only when he has tried it out that he learns that hens kept under any but the most favorable conditions are a liability rather than an asset.

Before the beginner with chickens can decide whether his inclinations lie with the fancy or with commercial production, he must learn a few things about chickens and their care. He must understand the four fundamentals, sanitation, feeding, breeding and brooding. Most beginners, I presume, recognize this. The question is, just how is one to learn these things.

If I were a young man or a young woman with a taste for poultry culture and without incumbrance, I would go up to the University of California and take a full course in agriculture with as much special work with poultry as I could manage. Poultry keeping, let us not forget, is a branch of agriculture. The poultryman ought to know not only how to raise the greens for his chickens but how to utilize his poultry manure in raising fruit and other crops. The specialty poultryman puts his eggs all into one basket. It is far better to plan for diversified agriculture with chickens as a profitable side line than to plan for poultry alone.

Begin Where You Are

But I am writing today to the man or woman who is busy with other employment, earning a living or caring for the house, and has only a limited time and space to devote to poultry. Such a man came to see me a few weeks ago, a man who had some spare time during the day, but only a few square feet of ground at his command, to ask how he should prepare himself to make the best use of the ten acres he had bought for a future poultry and fruit ranch. What I said to him I would say to any beginner: Start right where you are.

If I had had some experience in raising chicks with hens, as this man had, I would order 50 White Legborn chicks from a first class breeder or hatchery, and I would make very sure that they were chicks with some pedigree, all I could pay for or command. I would try to have them delivered in February, because February pullets are sure to lay in the fall. Then I would set about making a place for them and at the same time gathering information about caring for them.

Literature for Beginners

My first step in providing myself with literature would be to register for the poultry correspondence course given by the University of California. Full information regarding this course may be had by writing Extension Department, University of California, Berkeley. It costs $5, I believe, but is worth many times five dollars. As it extends over some months it will not take the place of general literature on the subject.

My second step would be to write College of Agriculture, Berkeley, asking for bulletins on raising chicks and feeding for eggs. I would also write to Maine Agricultural Experiment Station, Orono; the Cornell Agricultural Experiment Station, Ithaca, New York; Purdue Agricultural Experiment Station, Lafayette, Indiana; Iowa Agricultural Experiment Station, Ames, Iowa; Oregon Agricultural Experiment Station, Corvallis, Oregon, and Poultry Experiment Station, Storrs, Connecticut, for bulletins on these same subjects. You may have to pay for what you get, and you may may not be able to get anything, but excellent bulletins have been issued by all these stations, and if the supply is more than sufficient for home needs they are glad to distribute them. The only government bulletin I have seen that is worth while is "Important Poultry Diseases," by Dr. Salmon. All the others lag far behind those issued by the experiment stations.

Then you will want one good poultry book. Modesty makes me hesitate to recommend the Cultivator book, "Poultry for Profit," but it was written for beginners and tries to cover all they will need in a simple, practical way. For those who wish something more ambitious, Professor Dryden's new book on poultry husbandry is excellent. Particulars regarding it may be had from the Oregon station.

What Shall the Novice Do?

The above advice as to literature is for both the beginner who knows a little about chickens, and the novice who knows nothing. For both practice and precept must go hand in hand. There isn't much use reading about chickens unless you have a few to practice on, and trying to raise chickens without something to go by is like raising a baby without a good book to fall back on. The thing has been done again and again, but it is expensive.

By the word "novice" I mean the person who has never raised a chick. These people are more easily beguiled than any one else by the lovely display of fluffiness in the hatchery window. They take home a box full, put them in a box without air or heat, and that is the end of all that beautiful young life. The novice should begin with a sitting hen and a setting of eggs, follow the directions in the book in setting the hen and in caring for her during incubation, provide her with a comfortable coop, and watch Mrs. Biddy raise her family. You can learn a lot in one season from a few mother hens, with a good book to direct your investigations. When you have learned what little chicks need in the way of warmth and feeding you can branch out in any direction you please, by purchasing either hatchery chicks or fancy eggs, but by all means learn first how to raise chicks. The sacrifice of life on the altar of knowledge is too harrowing.

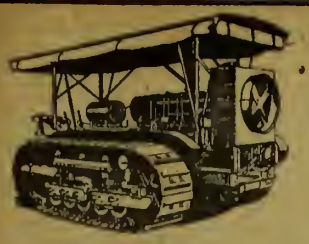
Poultry Queries

Conducted by J. A. Koethen

Weeks House

Doubtless you have heard of the Weeks system of management intended to increase egg production at the minimum expenditure of effort and designed to be followed by those whose plot of ground is limited in extent. It seems to me that this method might be followed with some success in the cooler—mountain or coast — sections of California, but would fail if put into practice in the warmer localities where the mercury frequently reaches 100 degrees or more. Crowding the hens in small space in territory subject to high temperatures would appear to invite disease and other troubles. Am I not right? And what do you know of the Weeks system anyway as a general proposition? — Subscriber, Keokuk Iowa.

The Charles Weeks house (I hardly think he calls it a system) was designed and is used by Charles Weeks of Palo Alto. I have seen two such houses and only two in Southern California, and I do not know how satisfactory they have proved. So far as I can see the house is as suitable for a warm climate as any kind of no yard house, for it provides just as much ventilation and about as much floor room and keeps the hens in smaller flocks. The main difference is that in this house 20 hens are kept in a space eight feet square, and that is all the room they have to exercise in. When 800 hens are kept in a house 16 by 100 each hen has but two square feet of floor space but she is privileged to roam over every other hen's two feet, so she has a much better exercising ground. The Charles Weeks house, as you probably know, is a long house, but only eight feet wide



"Accuracy"

—the title of a booklet, sent free, describing the ingenious instruments used in the Holt Plant to insure *hair-breadth* accuracy in size and fit of various parts of the "Caterpillar" Tractor—painstaking accuracy that accounts largely for the wonderful endurance of the "Caterpillar" Tractor and its low operating expense. Send for booklet 414 if interested in tractors.

GERMOZONE The Best Pet Stock Remedy

For Poultry, Pigeons, Dogs, Cats, Rabbits, Parrots, Canary and other birds or pet animals, Garmozone is a universal and safe remedy; for colds, snuffles, roup, sore throat, loss of voice or singing, influenza, bowel trouble, distemper, sora eyes or ears, canker, sleet, loss of fur or feathers, sores, wounds, skin disease, —or other affections of skin or mucous membrane.

"My hens have never done so well as this year and haven't lost a single chick"—Mrs. Flora Kapple, Walker, Ia. "Simply grand for rabbits"—L. W. Browning, Boone, Ia. "Cannot praise Germozone enough. I use it for chickens, stock and household"—Mrs. Wm. Hoeppel, Hugo, Okla. "My bird puppies don't know what distemper is and I never had such good success before with chicks"—Curly Smith, Kennett, Mo.

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c and $1.50 packages from Omaha. Book on treatment of diseases free with each package.

Two carloads of mules were last week shipped from Tulare to Arizona.

and divided into these square units which are entirely separate. Mr. Weeks claims that he gets more eggs by dividing the hens into these small flocks and that there is less chance for disease to spread. The main objection to the plan is that it makes too much work. Most poultrymen find that by keeping their hens in flocks of from 80 to 200 birds they get as good results with less labor. I never expect to see the house in general use anywhere. As for the adaptability of the no-yard house in general to a hot climate, that is a problem a good many people are working on. Theoretically you are right. Practically, the hens seem to do very well without yards wherever I have seen them.

Spineless Cactus for Green Feed

"You often have questions about feeding spineless cactus," writes A. F. Ames of Fallbrook. "I have fed it for five years to both hens and goats, and like it very much. For hens I commence feeding when slabs are about half grown, which is generally in June, and feed whole. Hens will not eat old, tough slabs, neither will goats unless they are starving. Goats will eat slabs six or seven months old, hut hens will not eat them well after three or four months. My hens have laid well while being fed cactus, often gaining in egg production. Goats also do well, for the cactus is laxative and keeps them in fine shape when they are on dry feed. They never go off their feed or have digestive troubles when fed cactus."

Oiled Floor for Coops

What objection, if any, is there to an oiled floor for poultry coops?—Subscriber, Fallbrook.

I do not see what objection there can be to oiled floors, unless it is that they cost some trouble and expense. I have read that the dirt floor, tamped down and oiled with road oil, makes a very fine hard floor. When a board floor is required to keep out rats and moisture, as in all our big commercial plants, it would not be much improved by oiling.

Raising Pullets

I have wondered if one could make a living raising pullets for sale. Is there always a demand for them around Los Angeles in August and Septemher at a fair advance on cost of raising? I have a deciduous orchard and alfalfa for them to run on, hut will have to huy all my feed. I have been very successful for the past six years raising chickens. Am getting along in years and feel the need of letting up a little on the work, and egg production confines one very close. One could use cheaper buildings and the land would be free from fowls for several months of the fall and early winter, in fact, nearly six months, so it would not get foul.—Subscriber, Fallbrook.

Yes, the demand for pullets in the fall always exceeds the supply. One who understands raising them ought to do very well by devoting himself exclusively to this branch of poultry work. Only last week I talked with a man who said he had hunted far and wide for some one to raise 500 pullets for him. I have sent him your address and hope you will get in touch with one another.

FARM BUREAU EGG LAYING CONTEST

The end of the sixth week of the California farm bureau egg laying contest shows W. J. Neef still in the lead.

Standing of pens to date:
W. J. Neef, Santa Cruz, 238 eggs.
D. B. Walls, Petaluma, 199 eggs.
C. Brown, Santa Cruz, 185 eggs.
S. L. Gibson, Santa Cruz, 183 eggs.
B. Rose, Santa Cruz, 170 eggs.
W. Wood, Santa Cruz, 160 eggs.
C. K. Hale, Santa Cruz, 153 eggs.
P. Pasquale, Inglewood, 153 eggs.

Leading pens for week: W. J. Neef, 46 eggs; D. B. Walls, 41; Enterprize Poultry Ranch, 40; P. Pasquale, 36; B. Rose, 35; S. L. Gibson, 33; C. Brown, 33.

Leading individuals to date: (These pullets all average over 70 per cent since start of the contest.) Owned by—D. B. Walls, 35 eggs; H. Peck, 32; Bellow Bros., 30; H. Peck, 31; A. M. Webb, 30; D. B. Walls, 30; Enterprize Poultry Ranch, 30; R. C. Gibson, 31; W. J. Neef, 31; P. Pasquale, 31; W. J. Neef, 30; W. J. Neef, 30; G. G. Barker, 30.

Heider

Fewer Parts—No Gears to Strip —More Power for the Pull

Heider Friction Drive does away with clutch, transmission gears and bevel gears. No gears to strip. Power ordinarily used by these parts is put into drawbar pull or belt work. **7 speeds forward, 7 reverse,** for traction or belt with one motor speed, one lever. Saves wear—easier to operate. Simplest drive known.

12 Years Actual Field Work

You do not have to take a one or two days' "demonstration" as proof. America's leading power farmers have been using Heiders for 12 years. Many original Heiders are in use today.

Ask for Heider Catalog, which also describes the famous Rock Island CTX Tractor Plows and the Rock Island No. 38 One-Man Tractor Disc.

E. P. BOSBYSHELL

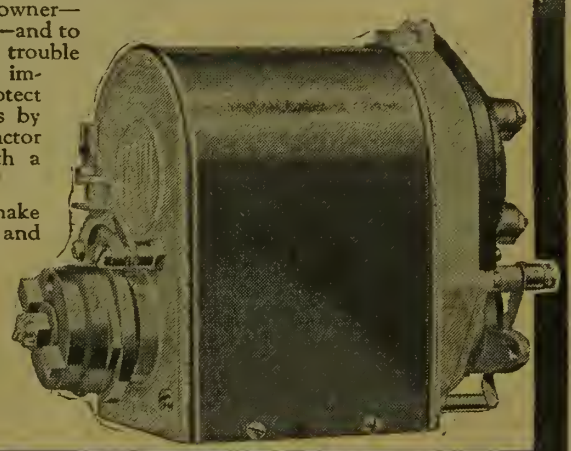
MONARCH TRACTOR
K W EQUIPPED
DOING WINTER WORK

The Power Farmer's Watch Dog

Every operation—every Farm Tool—every active power minute—the very power life of the tractor itself is centered on the Reliability and Efficiency of the K-W MAGNETO to keep the work of four seasons going.

That Vital Power which either means profit-producing operating machines, or failing, leaves a silent, useless mass of iron and steel, is directly dependent upon thousands of Hot, accurately-timed sparks per minute.

Tractor Dealers KNOW this fact—MOST manufacturers realize it, and YOU, the tractor owner—who pays the bills—and to whom constant, no trouble service is of vital importance, should protect your own interests by insisting on *your* tractor being equipped with a *K-W Magneto.*



Write us stating make of tractor you own, and tell us you Ignition Problems.

THE K-W IGNITION Co.

Citrus Markets

Los Angeles, January 7, 1920.

The output of navels will be far lower than anticipated earlier in the season. This is partly due to wind but more to the fruits running rather small. Independent buycrs are reported as paying four cents per pound for February delivery. F. o.b. price is ranging between $3.50 and $3.75. Auctions report as high as the $7 price but this is only occasionally, the prices generally ranging from $2.50 to $5.00.

Lemons are still extremely low, poor grade fruit in auction sometime selling around 40 and 50 cents. Good stock occasionally commands in the auction around $3.50 to $4.00. One sale reported last week in Boston reached $6.10.

Shipments

Shipmcnt of oranges from Southern California to date since November 1, 1919: Oranges, 3,622 cars; lemons, 602 total, 4,224. To samc date last season; Oranges, 2,222; lemons, 1,206; total, 3,432. Central California: Oranges, 3,259; lemons, 120; total, 3,379. To same date last scason; Orangcs, 2,074; lemons, 150; total, 2,224. Northern California: Oranges, 259; lemons, 20; total, 279. To samc date last season: Orangcs, 219.

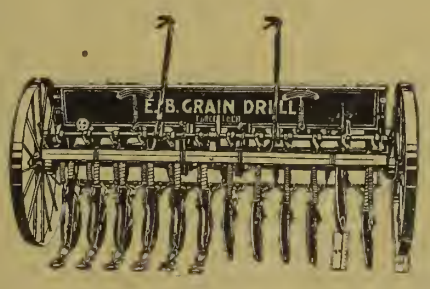
Important Now and at Harvest Time The Choice of the Right Grain Drill

Proper planting is the first step toward a successful crop. The choice of the right grain drill now means many extra bushels at harvest time. An investigation will show you why an E-B Drill assures you more bushels per acre, more bushels per man and more acres with the same seed.

Here are a few features that have made E-B Drills the choice of so many farmers:

1. Plants with equal facility in weedy or trashy ground, stubble or sod, or in soft ground.
2. Eccentric spring lift assists in raising discs or forcing them into ground. Adjustable so that 10 or 12 discs can be raised with one finger.
3. E-B Grain Feed combines fluted feed and double run or internal feed. Prevents bunching and cracking of seed. Sows all kinds of small grain.



4. E-B Single Disc Closed Delivery Opener deposits the seed in the bottom of the furrow.
5. E-B Double Disc Furrow Opener insures greatest crop return because all seed is planted at an even depth and well covered with soil.

Any E-B dealer will explain these superiorities and many more in detail. And if your needs are for a specialized type of drill, he can give you helpful information about the full E-B line.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Wife's Property Rights

A woman marries a widower with one son. Before marriage he owned a ranch upon which there was a mortgage. Subsequent to marriage the wife worked and helped pay the mortgage. Can the husband make a will leaving the ranch to his son? The two have taken out a homestead on new land which is not very good. Is it true that on the death of the husband the homestead belongs to the wife? If so, does the wife share in the other property? Can the ranch be sold without the wife signing the deed?—Subscriber, Stratford.

All property owned before marriage, and that acquired afterwards by gift, bequest, devise or descent with the rents, issues and profit thereof, is the separate property of the spouse owning the same. Such separate property may be encumbered, sold or devised by will without the consent of the other spouse. It would be very difficult for the wife to establish any claim in this separate property by reason of the fact that she assisted in paying off the mortgage. All property other than separate property is community property; such would be the case of the homestead taken up, and in came there was a declaration of homestead, under the state laws, upon the death of the husband, such homestead property would become the property of the wife. If the homestead is taken up under the government land laws, then it would follow the particular provisions of those laws and might become a part of the estate. All property other than separate property is community property in which, after payment of the debts against the community, the wife is entitled to her share.

Deed to Husband and Wife

A husband and wife with no children buy a ranch on contract made in the name of both. In case one should die, could the deed be made to the survivor without court proceedings? How should the deed be made so the property would revert to the survivor without expense? Would it be necessary to pay an inheritance tax in the case of the death of one of the parties when the deed is made jointly? —Subscriber, Redlands.

A contract or deed to the property may be so drawn that upon the death of one, the survivor will succeed to the rights of the deceased, in which case the survivor would be required to pay the proper inheritance tax based upon the valuation of the interest in the property. In order to draw such a contract or deed it would be best to go to someone skilled in such matters. The usual provision is that property is to be granted to the two persons named or their survivor in join tenancy.

Contract for Sale of Land

J. bought 40 acres of land from P., making cash payment and giving crop mortgage with the provision that in case the crop was insufficient to pay then the mortgage was to become a lien upon the land. Other payments were to be made subsequently. The crops were insufficient to pay the mortgage and nothing else has been paid. J. claims that he has an equity in the property for the amount of first payment and mortgage. How can the vendor proceed? — Subscriber, Imperial.

Without seeing the particular wording of the contracts it is impossible to give any direct opinion in the matter. It is probable that there was an original contract for the sale of the property at the total purchase price. It is possible that a mortgage could be so drawn that it would become an encumbrance upon the property. P. would probably take action to foreclose his vendor's lien in case of insufficiency in the agreements between the parties. He could undoubtedly foreclose his mortgage if it was a lien upon the property. Whether it was a lien or not could be determined only from the particular wording of the mortgage. The presumption is that it is not. You should probably take the matter to some attorney in your locality.

Mexican Land Patents

In the years past my father obtained patents to numerous property interests in this state from the Mexican government. On his death all of his property was willed to his wife. I have received no share in his property. Lately there has been a fire in the house which has burned up all of the papers. I understand that my father was drunk when he signed the will. Much of this property was never probated. What is the position in respect to it?—Subscriber, Pope Valley.

The title deeds and evidences of title were undoubtedly recorded in the office of the county recorder. Such records are prima facie evidence and would show the title so that the destruction by fire of the title deeds would probably be of comparatively little importance. If it can be shown that a will is executed when the testator is not of sound and disposing mind, as would be the case if under the influence of liquor or drugs, such will can be refused probate and the property would thereupon descend according to the manner provided by law as if there were no will. As to property which was never probated, there is a defect in the chain of title which is subject to attack by any heir of the party owning the property before death. During the early days in California there were many of such omissions to probate, and lately found heirs have in many cases been successful in recovering the property.

Kicking Horse

I sold a driving horse who kicks on driving down hill with buggy. The neighbor to whom I sold said he could handle her. He paid $10 on account of $30 purchase price, the balance to be paid in the next month. He now refuses to pay the balance and demands his $10 back. It seems the neighbor put the horse on a plow and she kicked the plow as well as the cultivator to pieces. I never misrepresented the horse. Can I recover my $20?—Subscriber, Pope Valley.

If the purchaser was fully acquainted with the characteristics of the horse as to kicking and temper, doubtless he can make no complaint and you are entitled to recover your $20. Such contracts, however, are difficult to prove and the matter is one purely of fact, as to whether or not the reputation of the horse was fully known.

Form C Single Phase Motor
25 Horsepower One Manpower — 1-6 HP.

Pumping 1000 Gallons Per Minute

This installation of a Vertical G. E. Motor connected to a Deep-Well Turbine Pump is operating at 1150 R. P. M. and pumps 1000 gallons per minute from a well 50 feet deep and 12 inches in diameter.

This one pump installed on a ranch at Santa Clara, Calif., is of ample capacity to irrigate 40 acres of prunes and in fact could easily supply 50 to 60 acres.

When selecting motors it is always well to remember cost is not price in the beginning, but cost in the long run.

The electric way is the modern way—the proven economical way.

HE ADVERTISED

here was an old geezer and he had a
lot of sense;
e started up a business on a dollar-
eighty cents—
he dollar for stock and the eighty for
an ad
rought him three lovely dollars in a
day, by dad.
Vell, he bought more goods and a little
more space,
nd he played that system with a smile
on his face.
he customers flocked to his two-by-four,
nd soon he had to hustle for a regular
store.
p on the square, where the people pass,
e gobbled up a corner that was all
plate glass.
e fixed up the windows with the best
that he had,
nd told 'em all about it in a half-
page ad.
e soon had 'em coming, and he never,
never quit,
nd he wouldn't cut down on his ads
one jit.
ell, he's kept things humping in the
town ever since,
nd everybody calls him the Merchant
Prince.
hy, he was doing business when the
times were punk.
eople have to purchase and the geezer
was wise—
or he knew the way to get 'em was to
advertise!

—E. F. McIntyre.

IN SPITE OF TERROR

Continued from last week.

Billy turned toward the deck house.
alf the nearer end and all one side
it were ablaze, as were two or three
rrels of lubricating oil and the deck
out them. Along the far side of the
bin, however, was a narrow strip
deck still free of flame; it led to
e iron ladder that climbed the
arer tank.
Billy ducked behind the low side of
e deck house and rushed for the iron
dder.
The moment his head came above
e deckhouse roof, the hot breath of
e flame seemed to flow over him, and
gasped and ducked involuntarily.
was a good deal worse than he had
pected. It seemed that the very air would scorch him before the blaze approached.

He drew a quick breath and climbed as fast as he could.

Reaching the end of the ladder, he stepped out on the broad, rounded top of the tank. The wide vent in the middle was large enough to admit a man's body. A flat iron lid closed it, and was fastened in place by turnbuckles with hand screws.

His hands were on the fastenings of the lid, and he was working with all his might, when a twist of the flames below swirled a fierce blaze against the side of the tank and up almost to his feet. The hot, thick smoke rushed into his eyes and nose and nearly strangled him. And it seemed as if the whole side of his hand and arm and face had been seared. He dodged and staggered and cried out with the pain, and he almost fell between the sloping sides of the two tanks. But a sudden little back flow of wind carried the blaze away, and he began again to work at the fastenings.

Two of the turnbuckles were already loose; the third and fourth turned easily. He grasped the handle of the lid and lifted with all his might. It rose, slipped, and slid over the edge and fell toward the fire; and a warm, sickening stench of gasoline swept up into his face.

Gasoline! It was the most inflammable and explosive thing of which he knew! Worse by far than gunpowder was that vast store of volatile liquid fuel under his feet! He leaped away to the second tank, and for a moment the temptation to dive off into the cool water below was almost too strong to resist. Would not the open tank explode at once? Then, with shaking hands, he attacked the fastenings of the second tank.

This task was easier. The lid came off quickly. He stood up, and then a sudden great flare of fire like an opened fan seemed to leap up out of the smoke, and a roaring boom, like the discharge of a cannon, shook the iron under him.

The whole air above the deck house seemed filled with spurts of pale blue and sapphire light. Something tremendously big and powerful—irresistible—suddenly caught him up and flung him headlong into the bay!

He came to the surface half-dazed; the salt water filled his nose and throat. He struck out desperately, with the instinct to swim away from the fire.

They picked him up — Claude and the tankboat man—a minute later. They had cast off from the stern, had come round toward the bow, and had shouted to him to jump. Then one of the barrels of lubricating oil on the deck had exploded. And Billy came back to his full senses in the boat to find himself unhurt, except that he was singed a little, and to learn that the tank-boat man, in spite of his broken ankle, was running the motor-boat engine.

Of course, by the time Claude turned The Chip up to the club dock, there were scores of people on the shore; and of course there were cheers on cheers when the story became known. For it was by the light of two huge, wonderful plumes of fire, that stood up 30 feet each from the opened vents of the gasoline boat's tanks, that the passengers of the motor boat were lifted out and led up to the club piazza. And those fountains of yellow flame, with the spray of fire that drifted seaward from them, showed clearly enough that Billy's work had been worth while.

To disagree with the other fellow and still remain friendly; to see the other fellow's viewpoint and still cling to your own opinion with a smile that is sincere; to travel the first fifty miles in company with a crowd quietly and not tell all you know; to smile at the breakfast table and then go to work, not willingly but anxiously, proves that you are a bigger man than the ordinary fellow we find on the pay roll.—Exchange.

DELICIOUS RIPE OLIVES

Every Californian knows how delicious ripe olives are, but here are suggestions for ways of using them, perhaps new to some Cultivator readers:

Olive Sandwiches

Pit one pint of ripe pickled olives; grind fine with one-half cup of California wainuts; moisten liberally with mayonnaise, and spread on lettuce leaves placed between thin slices of buttered bread.

An excellent sandwich is also made by combining equal parts of chopped olives and shrimps and mixing this with mayonnaise.

Minced Olives

Twelve ounces of ripe pickled olives; four ounces of preserved sweet peppers. Run the olives and peppers through a meat grinder. This mixture is very good for sandwiches.

Mixed with a few stalks of chopped celery and mayonnaise this makes a fine salad.

Olive Sauce

Four tablespoons butter; one sliced onion; five and one-half tablespoons flour; two cups brown stock; one tablespoon salt; one-fourth teaspoon pepper; one dozen ripe pickled olives. Melt butter in a saucepan; add onion and cook until slightly brown; remove onion and stir butter until well browned; add flour, sifted with seasonings; stir to a smooth paste and continue browning; add stock gradually, beating constantly. Pare the meat from olive pits, leaving it in one continuous curl; cover with boiling water and cook six or seven minutes; drain and add sauce. This is delicious with meats or wild fowl.

Artichoke Salad

Boil artichokes with a teaspoon of salt until tender; when cold, remove the center of the artichoke, chop it with pitted ripe olives; fill the mixture and serve with mayonnaise.

SHE has a good time at *her own* party—does the hostess who serves Ghirardelli's Ground Chocolate. Whether it's an "afternoon at home"—an informal evening—or some guests who "drop in" unexpectedly—Ghirardelli's offers the happiest solution to the refreshment problem. You save materials it is used with.

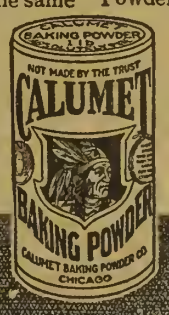
A perfect product of the world's largest, most up-to-date and sanitary Baking Powder Factory.

Contains only such ingredients as have been officially approved by U. S. Food Authorities.

Try it! Drive away bake-day failures. Reduce baking expense. Have most delicious and wholesome bakings.



BEST BY TEST

Style, Beauty and Rare Comfort

WOMEN who look for style and beauty first of all, find just what they want in Martha Washington Shoes. Late, correct styles always, and rare comfort built into every Martha Washington Shoe.

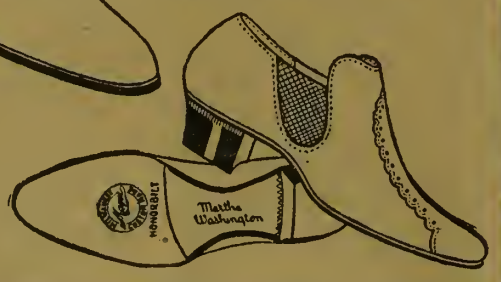
Try a pair of these famous shoes. You will like their comfort, the way they wear and the way they hold their shape.

Go to your dealer and choose from the many fashionable styles. After your first pair you will always want the complete satisfaction you get from Martha Washington Shoes.

Beware of imitations. Look for the Martha Washington name and Mayer Trade Mark on the Shoe. If your dealer doesn't handle them, write us.

F. Mayer Boot & Shoe Co.

Milwaukee, Wis.



This shoe has been widely imitated. Look for the name and trade-mark on the sole or label in the top.

Mayer Martha Washington Shoes

Olive Salad

To one pint of pitted ripe olives add one stalk of crisp celery, one or two tart apples and one-half teacup of California walnut meats. Chop all, not too fine, and serve on lettuce leaves with mayonnaise.

Stuffed Green Peppers

Six green peppers; one cupful bread crumbs; two level tablespoons butter; one-fourth of an onion, partly cooked; one-half cup chopped ripe olives; salt. Remove the tops and seeds of the peppers and boil them for ten minutes in salt water. Mix other ingredients and fill peppers. Bake for 15 minutes in a hot oven in a pan containing a little water. The peppers may be garnished with strips of pimentos.

Olives, Italian Style

Place ripe pickled olives in a pint or quart jar; cover with French dressing containing a clove of garlic. Allow this to stand for several hours, shaking occasionally. Serve as a relish.

Ripe Olives in Mexican and Italian Dishes

Ripe pickled olives should be used whole in chicken cooked Mexican style, and in all Italian and Mexican dishes, such as chili con carne, or tamales.

Olives in Croquettes

A ripe pickled olive in the center of a chicken croquette improves it wonderfully.

Crab Cocktail

Two-thirds cup mayonnaise; one-third cup tomato catsup; one head celery; one dozen ripe pickled olives; two green peppers; one crab. After removing the seeds from the peppers, run them, together with the celery, through a meat chopper; pit and chop the olives; pick the crab meat into bits, and mix all together with the liquid. Serve in cocktail glasses.

Beef Stew with Olives

Boil beef until tender; season with parsley, pepper, salt and a dash of paprika; add one cup ripe pickled olives pitted, and let them just come to a boil; thicken gravy with a tablespoonful of flour and serve with mashed potatoes.

Canapes

Cut stale bread into any desired shape and fry a delicate brown in deep lard; drain on brown paper. Mix equal parts of finely chopped ripe olives and English walnuts; season with cayenne and moisten with mayonnaise to the consistency to spread. Spread the mixture on the bread and garnish with thin strips of pimentos.

Oroville Olivettes

One pint ripe olives; one small can oysters; butter size of walnut; salt and pepper to taste; one cup milk; one heaping tablespoon of flour. Into a sauce pan put butter; when melted mix flour, add milk, olives and liquor from oysters; boil few minutes, add salt, pepper and oysters; serve on rounds of toast. (Will serve four persons.)

CAN APPLES

Apples that fall off the tree or are imperfect can be used satisfactorily to make apple products. Do not can any decayed part nor allow apples to become overripe before canning.

Canning Whole Apples

Wash the apples, which must be reasonably firm. Remove core and blemishes (pare if desirable for immediate use). Place whole apples in blanching tray or blanching cloth and blanch in boiling water for two minutes. Remove and plunge quickly into cold water. Pack in large, empty glass jars or gallon tin cans. Pour over the product a hot, thin syrup of about 18 degrees density. This is made in the proportion of two and one-fourth pounds of sugar to five and one-fourth quarts of water. Place rubber and top in position. Seal partially, not tight. If using tin cans, cap and tip completely. Process half gallon or gallon containers 20 minutes in boiling water, in homemade or hot-water bath outfit; 15 minutes in water seal; ten minutes in steam pressure outfit, with five pounds of steam pressure. Remove jars, tighten covers, invert to cool, and test joints. Wrap in paper and store. The time of heating will have to be varied according to ripeness and condition of the fruit. Use just enough time to sterilize perfectly, and yet not enough to change the color or reduce the pulp to sauce.

Uses for Canned Apples

Firm and tart apples may be cored and peeled first, then canned by the above recipe. Apples canned whole may be used for the following purposes:

A breakfast dish, with cream and sugar added; baked, like fresh apples; apple salad; a relish with roast pork—the apples may be fried in the pork fat; apple dumplings, deep apple pie and other desserts in which whole apples are desirable. The syrup of canned whole apples can be used for pudding sauces or fruit drinks.

HOUSEHOLD CONTEST

Read "This Week's Patterns" for prize offer for this month's household contest.

THIS WEEK'S PATTERNS

The feature of the newer dresses, the wide effect at the hips, is shown in the girls dress 3091 and the two dresses below. The bloused waist is also in evidence now, as in 3089. The wrinkled belt line in 3085 is new and very attractive. This waist with its vest, revere collar and odd closing is the very newest of the new and is used in varied form in the fashion books that depict Paris and New York styles.

The stores are already featuring summer materials. Especially is there a most fascinating showing of heavy cotton materials for children's clothes. The satisfactory Devonshire and similar weaves show solid colors in all shades, from dark navy blue, even black, through, browns, greens, pinks and yellows. Larger plaids are shown in the soft blending colors of the finer ginghams. An occasional sale can be taken advantage of, but beware of 27 inch widths which are less economical in making up and are sometimes offered at a few cents under the regular price for 36 inch material.

Soisette would be pretty and soft for the set of short clothes in pattern 3090. A tiny crocheted edge in white or colored mercerized cotton can be quickly made, would be dainty and wear well.

Prints and ginghams are now so expensive that one hesitates to buy them for house dresses and aprons. Just at present the city stores are selling men's shirtings in exceedingly good quality much cheaper. They are however, light in color and must make frequent trips through the tub and across the ironing board.

If anybody knows how to beat the H. C. of L. in the clothes sector, now is the time to pass the news along in the Cultivator columns. What are you going to do about it? The "simple art of doing without" is the main dependence, but some new things must be had. Where do you cut corners? Simple hints of the everyday economies will help us all. Send them to the Household Department, California Cultivator, Los Angeles.

For the best letter of suggestions $5 cash will be paid; for second best $1; all others published, one year's extension of subscription to California Cultivator, which is worth $1 in cash—and a lot more in real value.

All letters should be mailed by Saturday, January 17. That leaves just one week for getting them ready. They will be published in the issue of January 31.

The Little Foxes

It's the little foxes that spoil the grapes; so it is with health; mend the broken resistance and you have robustness, neglect and you have weakness.

Scott's Emulsion

concentrated tonic-nutriment, effectually mends the little weaknesses and sustains strength by building up the resistive powers of the body. If you would keep strong—use *Scott's Emulsion* often.

BE SURE TO SEND SIZE

3091. A Pretty Frock. Cut in 4 sizes: 8, 10, 12 and 14 years. Size 10 requires 4¾ yards of 27 inch material. Price, 10c.

3089-2644. A Unique Dinner or Afternoon Gown. Waist 3089 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 2644 cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. The width of skirt at lower edge is about 1¾ yard. For a medium size it will require 5⅝ yards of 45 inch material. Two separate patterns, 10c for each pattern.

3090. Set of Short Clothes. Cut in 4 sizes: 6 mos. to 1 year, 2, 3 and 4 years. Size 4 will require 2⅜ yards of material 36 inches wide for the Dress, ⅞ yard for the Drawers, and 1⅞ yard for the Petticoat. Price, 10c.

2697. Ladies' Apron. Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42, and Extra Large, 44-46 inches bust measure. Size Medium will require 4¼ yards of 36 inch material. Price, 10c.

2719. Girls' Dress. Cut in 4 sizes: 4, 6, 8 and 10 years. Size 8 requires 3¾ yards of 27 inch material. Price, 10c.

3085. Misses Dress. Cut in 3 sizes: 16, 18 and 20 years. Size 18 requires 5⅝ yards of 44 inch material. Skirt measures 1½ yard at lower edge. Price, 10c.

3084. Childs' Dress. Cut in 4 sizes: 2, 3, 4 and 5 years. Size 4 will require 3 yards of 27 inch material. Price, 10c.

3063. Dress for Home Wear. Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Size 38 requires 5¼ yards of 36 inch material. Width of skirt at lower edge is 1¾ yard. Price, 10c.

CATALOGUE NOTICE

Send 10 cents in silver or stamps for our Up-to-Date FALL AND WINTER 1919-1920 CATALOGUE, containing 550 designs of Ladies' Misses' and Children's Patterns, a CONCISE AND COMPREHENSIVE ARTICLE ON DRESS-MAKING, ALSO SOME POINTS FOR THE NEEDLE (illustrating 30 of the various, simple stitches) all valuable hints to the home dress-maker.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest Chicago styles, all pattern orders are filled in Chicago. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
California Cultivator
Los Angeles.

HOUSEKEEPING HELPS

If you have a carpet that looks worn and faded get a package of dye for wool of the desired shade, mix it in a pan of hot water and brush into the carpet with an ordinary paint brush.

After using the oil mop, instead of merely shaking the dust out, brush it thoroughly with an old whisk broom and keep the mop fluffy and unmatted.

Don't worry about your work. Do what you can, let the rest go, and smile all the time.

If you have an old kitchen table that you want to cover with oilcloth, paste it on with wall paper paste, smoothing out carefully. It will last much longer and always be in place.

If you have not an electric iron, save time and steps and heat by setting the flatiron on a heated brick or soapstone instead of on a cold iron stand.

There are so many uses for the meat grinder that it is handy to have it fastened to the kitchen table. Keep it clean by pulling over it a clean paper or cloth sack when not in use.

To prevent the wall paper being wet when you wash or oil woodwork, hold a strip of pasteboard along the wood facings. As you work slide it along, keeping it close to the woodwork, and taking a fresh piece when needed.

After you have paid for your steak don't let the butcher trim it and keep the trimmings to sell again. The scraps of meat and bone will help out the soup kettle, any fat can be melted and clarified for shortening.

A healthy baby cannot develop into a healthy man or woman if the mother relaxes her efforts toward health as soon as he can walk alone. There is never a time to "let up." Children are never too old to need careful supervision of their work, their play, their sleep and their food. If you would have your healthy babies healthy school children and healthy men and women pay as much attention to the years after they are two as to the months before they have reached that age.

TO OPEN FRUIT JARS

I note your offer to extend subscriptions on hints or suggestions that will benefit the readers of the Cultivator.

In mingling with people I find so many have such an effort to remove the caps of their fruit jars, and have often given them my way of opening sealed fruit jars.

To remove jar caps on sealed fruit jars, dip the jar with top down into boiling water several times until the glass is tempered, then leave in the hot water until the rubber is loosened, and it can be easily removed without prying up the lid; thus leaving the jar cap in good shape to use the following year.—Subscriber, Thermal.

CIRCLING WHEN LOST

"The tendency of the person who has entirely lost his sense of direction to 'circle' is well known and has been repeatedly proved by experiment," says George Gladden in Boys' Life. "The most plausible reason for this circling is that it is due to the unequal strength of the two sides of the body. That is, if the right side be stronger than the left—which usually is the case—longer strides will normally be taken with the right leg than with the left, and this will cause circling to the right. The circling seems always to occur when one becomes hopelessly lost and is likely to continue until the victim drops from sheer exhaustion. One instance on record is that of a lost man who, after walking steadily for six days and nights, finally stumbled into a camp only about six miles from his starting point. Five miles of travel in a straight line in any direction from that point would have brought him out of the woods and incidentally would have saved him from the loss of his feet, both of which were so badly frozen that their amputation was necessary.

"Traveling by landmark, or by compass, are the only sure ways to avoid circling. Landmarks should be observed carefully and frequently, for as one proceeds they are likely to change their appearance, sometimes very considerably. The importance of the compass to the lost man is, of course, very great, provided he uses it intelligently. And part of that intelligence will be shown by absolute confidence in the instrument for the present purposes. 'Magnetic variation,' that is, the difference between the magnetic north, as shown by the compass, and true north may be disregarded for ordinary pathfinding in the woods, as the deflection is not sufficient to throw the traveler seriously off his desired course. But beware of local attraction, such as would be established if the compass were held near any iron or steel object, like an axe or a knife or a belt buckle. To make sure that the needle is not being affected in this way put the compass on the ground and note whether the needle keeps its position in both places. Very rarely a compass will be affected by a mass of iron ore beneath the surface of the ground."

TO SAVE FOOD

Heating in a slow oven is a very simple and practical means of preventing infestation of foods or seeds. Where seeds are treated, care must be taken to prevent injury to germination, but in case of foods the strength of gas or the height of the temperature are not items so long as they are sufficient to kill the pest. Temperatures of from 120 degrees to 140 degrees Fahrenheit will soon kill any of the ordinary pests. This temperature, if maintained for only a short time, will also not seriously injure most ordinary seeds.

Simply spread out the food or other material to be treated in shallow pans or similar containers and place them in an ordinary stove in which the temperature should not go above 140 degrees Fahrenheit. Treat for from ten to 20 minutes and both eggs and feeding stages of all common pests will be destroyed. Foods or seeds should then be stored in clean containers, tight enough to insure that no pests may enter. Occasional inspection will be additional insurance.

SUCCESS FOR SALE

You want success. Are you willing to pay the price for it?

How much discouragement can you stand?

How much bruising can you take?

How long can you hang on in the face of obstacles?

Have you the grit to try to do what others have failed to do?

Have you the nerve to attempt things that the average man would never dream of tackling?

Have you the persistence to keep on trying after repeated failures?

Can you cut out luxuries? Can you do without things that others consider necessities?

Can you go up against skepticism, ridicule, friendly advice to quit, without flinching?

Can you keep your mind steadily on the single object you are pursuing, resisting all temptations to divide your attention?

Are you strong on the finish as well as quick at the start?

Success is sold in the open market. You can buy it—I can buy it—any man can buy it who is willing to pay the price for it.—Exchange.

PATENT WINDER

Seven years ago Henry J. Conners of Peterboro hung his vest on a fence in the barnyard. A calf chewed up the pocket of the garment in which was a standard gold watch.

Business of seven years passing, as they say in the movies. The butcher arrives on the scene, and the animal, a staid old milch cow, becomes steak and stew beef. But that isn't all; the missing watch was found in such a position between the lungs of the cow that the respiration—the closing and filling of the lungs—had kept the stem wound, and the watch, so Conners says, had lost only four minutes in seven years.

CARELESS OF HIM

Walter—Mr. Smith's left his umbrella again. I do believe he would leave his head if it were loose.

Robinson—I dare say you're right. I heard him say only yesterday he was going to Switzerland for his lungs.—Tit Bits.

Don't Give Decay an Eight-Hour Start

THE germ enemies of the teeth are most active at night. They can work undisturbed between the teeth where particles of food may remain unless you brush your teeth.

Don't give these enemies an unfair advantage—beat them by cleaning your teeth with Colgate's just before going to bed. This is safe, sane and delicious. Use it in the morning, too.

Teach the children this habit for health.

Colgate's is Recommended by More Dentists Than Any Other Dentifrice

The Car For All Roads

OVERLAND 4 is a car for all seasons and all roads; attractive in appearance; economical in operation. It glides over the roughest roads with a smooth steadiness that is amazing.

This remarkable car has the two-fold economy advantage of Three-Point Suspension Springs and light weight. Three-Point Suspension Springs give Overland 4, with 100-inch wheelbase, the riding ease usually associated with great weight and long wheelbase. They take most of the shock and rebound out of road jolts. They lessen greatly the fatigue of long rides.

By protecting car and motor from the constant racking blows which mean wear, these springs greatly reduce up-keep expense. They make possible riding comfort with light weight; and Overland 4's light weight gives the further economy of low fuel and oil consumption and greater tire mileage.

Overland 4 is a quality car throughout—in design, finish and riding qualities. Equipped complete from Auto-Lite Starting and Lighting to Demountable Rims.

JAN 20 1920

Is the World Going to Starve?

WE still watch for the census returns with intense interest. We ask: "Is the nearby city growing; is our state growing; are there more people to eat of our products; is our marketing field greater than it was ten years ago?"

The tendency must be toward the bigger and better. We must grow. The world must grow. So we are watching for the census returns.

But since the period of hunger of large portions of the world, which has followed war's destruction, the question sometimes suggested by the boast "See how fast we are growing," is "Can the world continue indefinitely to feed this ever increasing hoard of humans; will the soil of the earth produce enough a hundred or a thousand years hence?"

The answer to those questions might possibly include some sugestions as to the causes of the late war and certainly suggestions as to why nearly every one of the older nations of the earth is endeavoring to reach out and provide for its future peoples by colonizing and securing more of the earth's surface. They are looking to the preservation of their own kind.

Out of the bigness of her domain and bigness of her heart America has said—and still is saying; "Come, we have enough for you all, help us to reclaim our rich valleys, our hillsides, our deserts."

They came from all Europe; they came from Africa; and more recently, they have been coming from Asia. The European and African were true pioneers and did help in reclaiming swamp and desert; the Asiatic has been inclined to take advantage of the pioneering of the white race; he has pushed the white man from the improved land and taken only the richest and generally near the large cities.

Now Americans are beginning to think—a very few of us are beginning to think very seriously; we are asking ourselves; 'Has not the time come when we should become even bigger hearted than we have in the past and look more to the future of our own race?"

Take, for instance, the rich valleys around the city of Los Angeles. But a few years since they were filled with attractive homes of American gardeners and truck farmers. Today 85 per cent of Los Angeles' vegetables are grown by Japanese. The change has been gradual, in fact, almost imperceptible, excepting to the American farmer who has been forced off the farm. It is to be admitted that the Asiatic has proven himself economically the fittest to survive. His habits of living are such that the American farmer found it impossible at prices which were made to educate his children and provide comforts for his family and grow vegetables to supply Los Angeles markets. In other words, an unrestrained price war prevailed. The Asiatic proved himself superior for the American said: "Labor in the shipyard or in factories at shorter hours for higher wages suits me better." It is an axiom that the children born on the farms today rule the cities tomorrow. The birth rate on California farms is being increased with wonderful swiftness by the shipping to this country of women who are sent purely for breeding purposes, this in direct violation of the spirit of the agreement entered into between the two governments. And this violation in order to secure another violation of the agreement in that a "native born American" may hold title to land under the guardianship of his Japanese father.

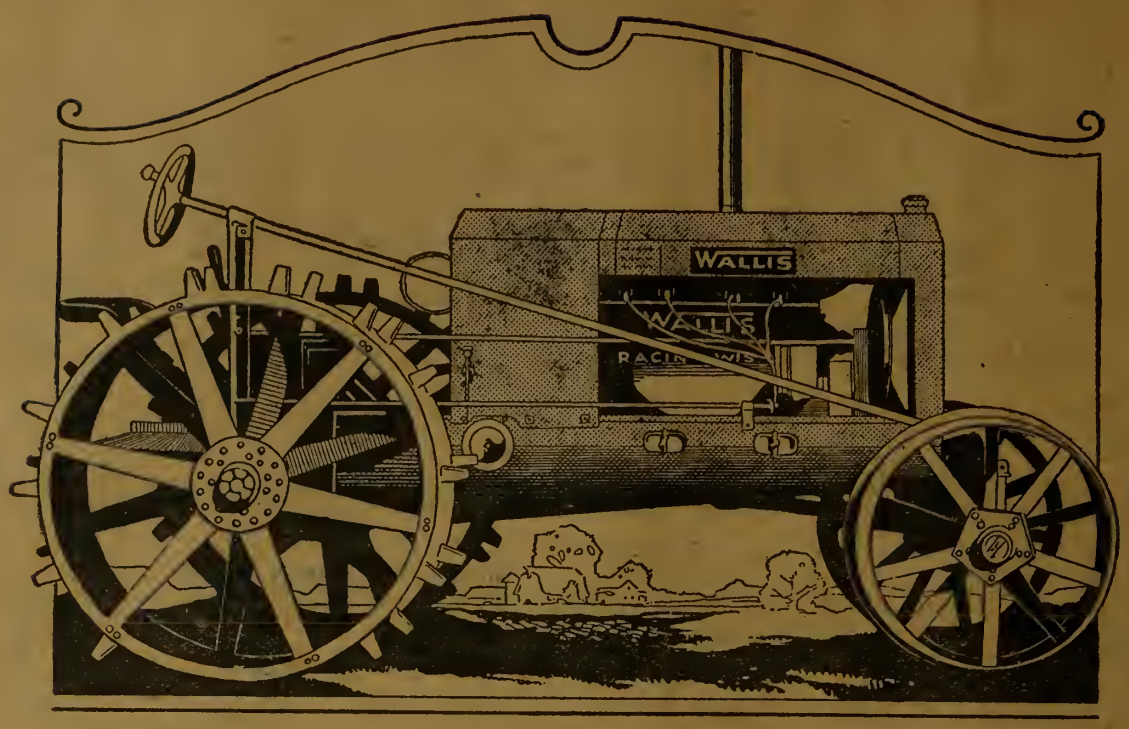
The people of the East are not in touch with these facts, are not in sympathy with our "race prejudice" and do not understand that we Californians are simply looking to the future of our own. "But if any provide not for his own, and especially for those of his own house, he hath denied the faith and is worse than an infidel."

The Japanese has proven his economic fitness, he is proving his wisdom by providing for the future of his own. The future generations of American born Asiatics will call him blessed.

The generations to come of our own will call us—

The East is saying "Business is good, don't disturb us."

The West is saying "Wait, we have commissions gathering facts."



DURING 12 years of service Wallis principles have proven above all else the attribute of constancy. We have established the incontestable fact that Wallis engineering is basically right—that this tractor is built to easily shoulder the strains of heavy farm work.

This important result is not a matter of chance. Wallis engineers have developed it by building on a basis of pure quality—by creating new standards and blazing new trails in tractor designing.

The Wallis owner knows the result: He has seen it in a sweet-running, powerful machine, which goes on day after day without faltering—a machine which serves him faithfully and teaches him the real meaning of tractor economy.

Any Wallis owner will point to his tractor with pride. He will show you the highly developed valve-in-head motor. He will point to the patented "U" frame—the lightest yet sturdiest foundation ever built into a tractor. It saves many pounds of needless weight—and practically eliminates vibration. Other important developments he will point out. For instance, the cut and hardened steel gears which run in dust-proof cases in a constant bath of clean oil; the removable cylinder sleeves which save the heavy cost of reboring cylinders and of new pistons if a cylinder is scored; machine finished combustion chambers—a refinement used only in a few of the finest automobiles.

The Wallis owner speaks of these things with enthusiasm because he knows that the rough work and terrific strains a tractor must overcome require even better engineering and materials, more careful and accurate workmanship than an automobile or truck. And he knows that his Wallis serves him faithfully because it is built upon such standards.

Today there is only one tractor of Wallis quality—and that is the Wallis. It represents a class entirely its own—a class extending back for 12 years when Wallis first proved that in quality—not bulk—is the only real tractor strength obtained.

Wallis owners know that the tractor is a perfected thing—a profitable investment. Wallis has proved it.

More and more men each day are finding in this quality machine the answer to their question "What Tractor?" The demand is heavy right now. This very day is the time to investigate, if you want a Wallis.

See the local dealer or write us.

Grafting Walnut Trees

By J. B. Neff

SUCCESS in grafting walnut trees requires greater care than in most of the deciduous fruit trees. There are certain rules to be observed which must be carefully followed and at the same time there are other supposed rules which have no bearing on success.

The larger part of the nursery grafting is done by persons who are expert hence we will confine our remarks to the grafting of older trees which have been planted in orchard form and are not producing as well as could be desired. It is not good policy to allow walnut trees which are not producing well to grow to the age of 15 or more years without top grafting, as those trees have large branches which have to be taken off, and scars are left which are slow in healing over and which, if not given more care than the average grower will have time to give, will eventually cause much damage to the trees. If however, there are thrifty trees in the orchard which are not producing well they can be greatly improved and will come into good bearing much sooner by top grafting than would be the case if the tree was removed and a new one planted.

If it is at all possible the scions should be placed in branches not more than three inches in diameter and two or three scions should be placed in each branch. If the scions should all grow they can be left the first year and the best one left at pruning time next winter. In most cases three to five branches will be enough to leave in which to place the scions, and the other branches should be cut close the body of the tree before beginning the work of placing the scions. Scions should always be of solid, mature wood, that is, with as small pith as can be conveniently found, and with good living buds. The growth having buds close together is best as shorter scions can be used, which is an advantage as they require less moisture and are not so liable to be moved by birds alighting on them.

The most convenient size is about one-fourth inch in diameter and three and one-half inches long, but equally good success is obtained with scions much smaller, or as large as five-eighths of an inch diameter if properly placed. It is probably well to state in this connection that the movement of the sap in the trees is upward through the white wood and downward through the cambium layer (between bark and wood), that the requirements for successful grafting are that the union of scion and stock be such that the upward flow of the sap in the stock can pass into the scion and that the downward flow can pass from the cambium of the scion to the cambium of the stock. Also that all cuts, on ends of scions as well as where the scion is inserted in the stock, shall be thoroughly covered with wax and air tight. Where clefts are made pour these full of hot wax after placing the scion.

When the stubs are cut at the proper place use a heavy butcher knife and mallet to make the clefts, placing the knife across the stub as if a chip one-half to five-eighths of an inch were to be split off. Then depress the handle of the knife to an angle of 30 to 45 degrees and split the edge down two and one-half or three inches, allowing the edge of the knife to reach the farther side of the stub but not cutting down on that side. Open the cleft with a steel wedge one-half inch wide and thickest on one edge, placing the thickest edge toward the outside and far enough from the bark to allow room for the scion. Trim the cleft in the stub so it will be smooth, using a sharp knife. Then cut the scion so it will fit perfectly and place it so the inner bark (cambium layer) of both will be on the same line or at least cross twice. Remove the wedge and put hot wax over all the cuts on both scion and stock at once. The work should be examined every three or four days until leaves are formed, and if threadlike cracks are found they should be covered with hot wax. Any cuts on the body of the tree should be covered with a coat of heavy mineral paint and the trunk and stubs should have a coat of whitewash. An excessive flow of sap for a week or two will kill the scions as the callus cannot form in water. This flow of sap can be controlled by boring one-quarter inch holes in the trunk of the tree near the ground. Bore one or two holes three or four inches deep and wait a few minutes to see the effect before boring more. Do not bore too many holes as three or four will be sufficient to control the flow on the largest trees. These holes soon callus over and do not damage the tree.

If the sap flow has damaged the wax covering wipe it off and cover again. The wax can be made of one pound beeswax, five pounds rosin, one teacup flaxseed oil and one ounce lamp black melted together. The object is to get a wax which is soft enough to be pliable without running in the hot weather. Be sure to get pure flaxseed oil as an oil that will not dry on exposure to the air will penetrate the bark and destroy the cambium, in that way killing the scions. The lamp black is added as coloring matter to show when all the cuts are covered. After the scions have made a foot of growth it will be necessary to nail laths to the stubs and on the tree in such a manner that the new growth can be trained in the desired direction. Care must be taken that the scions are not disturbed when nailing. Strong laths will be needed and can be made of Oregon pine, one inch by two inches by eight feet long. These will be needed two years before removing. Do not take off any of the sprouts at first except those within a few inches of the scions, but as the scions increase in size the sprouts may be thinned, and when the sprouts become two feet long they should be headed back but not removed entirely until the next winter. Do not head back any of the scions during the growing season.

The grafting can be done at any time after the middle of January, but if only a few trees are to be grafted it will be well to wait a month later since there will be less time in which they will require attention. The grafting can be continued until the sap begins to flow and causes the bark to slip. Scions can be cut at any time after the trees are dormant until the bark begins to slip and the buds swell and open. Scions should always be kept in a cool damp place but not where they will be wet. Damp sawdust inside a house is a suitable place.

It is not necessary that scions be cut in advance and "cured" as it is some-

Dairymen! On Your Guard!

By R. P. Royce

LAST week Attorney-General U. S. Webb granted permission to Mrs. M. M. Webster of Sacramento, George M. Renner of Stockton, S. M. Bailey of Imperial and R. Holcomb of Fresno to use the name of the state to sue the Associated Milk Producers of California and four affiliated corporations (the Northern California Milk Producers Association, the Milk Producers Association of Central California, the Imperial Valley Milk Producers Association and the San Joaquin Milk Producers Association).

The suits in question are the result of the request made last September by John W. Preston, representing the above named parties, and to which reference was made in our issue of September 27.

Judging from the reports in the daily press, the case against the milk producers is to be thoroughly tried in the metropolitan papers. And in the opinion made public by Webb the producers stand guilty of several crimes, for the attorney-general says: "I am satisfied from the records and statements before me that, due to the operation of some, if not all, of the respondents (and it is acknowledged that they all act in concert), both milk and manufactured dairy products have been diverted from their local and natural markets; that surplus milk has been destroyed for the apparent purpose of limiting the supply and thereby keeping up the price thereof to the consumer, and that the price of milk has been raised to the consumer in localities controlled by respondents while in localities not so controlled and where free or nearly free competition has obtained, similar raises in the price of milk to the consumer have not occurred."

And there you are!

The worthy attorney-general has evidently spent several months investigating the problem—but we wonder from what angle the study has been made. Has the attorney-general gone to the dairymen themselves and ascertained their problems? Did he take the trouble to discover how much production costs have mounted? Did he investigate the increased price of labor and feed? Did he come to the realization that the dairyman is a consumer and that, in common with all other consumers, his cost of living has mounted by leaps and bounds? Did he find that sugar, flour, shoes and clothing cost the dairyman as much as they do the city or town consumer? We take it that he did—otherwise he would have hesitated to lend the name of the great state of California to those who seek to sue the milk producers.—(Continued on Page 110).

Agricultural News Notes of the Pacific Coast

Northern California

The Alameda County farm bureau has been holding pruning demonstrations.

Lower Sacramento River sections are shipping about 15 cars of celery daily.

Willows, Glenn County, reports jujubes producing profitably in that county.

Low water has made serious situation in transportation on Sacramento River.

Canneries are contracting for next year's asparagus crop along the Sacramento River.

Livermore, Alameda County, has been selling its last wool clip on $1.35 to $1.40 scoured basis.

The Pacific Coast office of the United States sugar equalization board has been closed.

The bigh school at San Juan, Sacramento County, is conducting a short course in poultry culture.

Durbam, Butte County, Cooperative Stock Breeders Association will hold its fat hog auction sale January 19.

Nurserymen of Yolo County report sale of ten carloads of young almond trees to go to San Luis Obispo County.

Tehama County's farm bureau membersbip totals 256. The attendance at the meetings during the year totaled 2,837.

Glenn and Colusa County farmers have subscribed $100,000 to start work on Glenn-Colusa irrigation district.

Solano County farmers are subsoiling and winter irrigating in order to conserve moisture for next season's crops.

Butte County rice growers contemplate largely increased planting because of long price expected in the 1920 season.

Engineers are still investigating tbe Iron Canyon dam site with reasonable hope that a good base for foundation may yet be found.

San Francisco will hold a National Rabbit and Cavey Show January 29 to February 1. V. C. Howe of North San Leandro is secretary.

The Sutter County farm bureau directors contemplate erection of halls for exhibition and social gathering purposes at Meridian and Nicolaus.

California auto numbers now given out are reaching well up toward tbe 600,000 mark. It is said there are actually in the state 463,887 machines.

Rice growers and a great many otbers are hoping sportsmen will bear in mind that tbe duck season closes January 31 and keep their guns active meantime.

E. M. Sheeban, formerly secretary of the state viticultural commission, is urging construction of evaporators as an aid in handling the next wine grape crop.

Rights of way for state highway have been secured through northern Sonoma County and material extension of state highway construction is anticipated.

Modoc County livestock men are objecting to too much sunshine. Roads often closed by snowbanks at this period of the year are free and travel is good, but the livestock is suffering from lack of pasture because of rain shortage.

Central California

Ceres contemplates the erection of a fig cannery.

Raisins already marketed total practically 183,000 tons.

There are six times as many cattle as hogs in the Santa Clara Valley.

The Prune and Apricot Growers of Hanford bave purchased site for packing house.

Delhi, Merced County, held a New Year's rabbit drive which netted 115 of the pests.

Turlock board of trade has advanced money for financing hog auctions to be held monthly.

Navel orange shipments from Lindsay, Tulare County, to date reach above 1,000 carloads.

The total hay crop of Santa Clara County fell off 7,000 acres last year to make room for orchards.

The cotton growers of Fresno County organized for mutual benefit at a meeting at Fresno on January seventh.

Eastern returns on Tulare County navels indicate a price to the growers f. o. b. Porterville of $4.00 to $4.50 a box.

Santa Clara County has 7,652,000 prune trees on 76,520 acres, tbe next in importance being 665,800 apricots on 6,658 acres.

Tulare County has levied a special tax of $1.50 on $100 valuation to build roads connecting with improved state and county highways.

Tulare County farm bureau has appointed a delegate to the state federation. The county has conducted a campaign for new members.

Farmers of Crows Landing district, Stanislaus County, are planning the extension of irrigation ditches and reclaiming large tract of dry land.

January 16 the state will auction 6,825 acres of school land at San Luis Obispo and on the 19th at Salinas 8,489 acres in Monterey County.

Tbe new sweet potato curing plant at Turlock, Stanislaus County, is in operation and the first carloads of the product will be shipped before January 15.

Santa Clara County ranchers complain tbat ranch hands will not work horses because they have to care for them after working as many hours as other help.

County Commissioner Fred Roullard of Fresno reports inspection of 334,408 acres and the poisoning of 59,000 acres with 26,000 pounds of poisoned grain in squirrel campaign.

The San Joaquin County assessor says Japanese own $315,805 worth of land in that county and 213 Japanese own $250,345 worth of personal property outside incorporated cities.

Milk from 1,000 cows per day is being used at Tulare in the powdered milk factory. Nine pounds of powder is obtained from every 100 pounds of milk; the 91 pounds are water.

The head office of the California Prune and Apricot Growers Association at San Jose reports added acreage to date over last ycar's of 7,000 acrcs of prunes and 2,000 acres of apricots.

Farm home meetings for January in San Joaquin County are: Lockeford, 15; Manteca, 16; Acampo, 19; Linden, 20; Ripon, 21; Escalon, 23; Lodi, 24; Live Oak, 27; La Fayette, 28; French Camp, 29; Farmington, 30.

Southern California

Imperial Valley is now forwarding carlots of grapefruit.

Chino walnut growers are planning big packing and warehouse.

The San Diego poultry sbow is on this week; will end next Monday.

Commissioner Brock of Ventura County is making a gas drive on squirrels.

Claremont and Pomona packing houses are running full handed on navel shipments.

Newport Beach, Orange County, has ruled against locating of oriental fishermen in that section.

The Poultry Breeders of Southern California closed its annual poultry sbow at Los Angeles Tuesday.

San Bernardino County reports its crop of oranges, especially Valencias, much lighter than that of last year.

In San Diego County the 200 acres of cabbages are expected to yield 75 carloads, shipping to begin January 15.

The O. K. Fruit Exchange, comprising Ontario-Upland-Cucamonga district, shipped last year 3,356 cars of citrus fruits.

A new townsite named Hillgrove has been laid out between El Monte and Puente, Los Angeles County, on the Salt Lake railway.

The Goleta, Santa Barbara County, walnut warehouse is still handling nuts and gleaning and sorting will continue to Feburary 1.

Tbe Salt Lake citrus packing house at Riverside is being greatly improved in equipment. Several thousand dollars worth of machinery is being installed.

The farm bureau of Imperial County is urging county commissioners to postpone road building campaign until more definite plans as to best routes can be made.

El Cajon Valley, San Diego County, has begun its orange shipping season; its fruit is running largely to Sunkist grade and is being shipped under Cuyamaca label.

The new cotton compress at Los Angeles is working on its first order of 3,000 bales. Large cotton warehouse facilities have been provided at Los Angeles harbor.

Imperial cotton growers recently made a journey to the Salt River Valley cotton producing section of Arizona, gathering information as to long staple culture.

The Pomona Valley Poultry Association recently elected as president C. H. Taylor; first vice president, A. M. Green; secretary, H. G. Brown; treasurer, Carl Trebing.

Murray Horne of Los Angeles is shipping to a brother in Gladstone, Australia, one pure bred bull and one heifer of Polled Herefords, purchased at Des Moines, Iowa.

Rhodes grass is securing increased planting in many parts of the Imperial Valley. It was introduced there in 1902, being originally secured in South America by the department of agriculture.

There will be a short horticultural school course at Hemet, Riverside County, January 11-14. Profs. Bioletti and Whitten of the state agricultural college and Farm Adviser Hodgson of Los Angeles County will be present.

The Coast and General

The Washington state irrigation institute was recently held at Spokane

Tbere will be 120,000 acres about Phoenix, Arizona, planted to cotton in 1920.

The National Wool Growers Association will meet in Salt Lake City January 19-21.

The Washington Poultry Association recently held its annual sbow at Wenatchee.

The weather bureau's last report for Arizona stock ranges is: "Good, plenty of grass and water."

Idaho wool growers in session at Boise favored ten year grazing permits in public lands.

Cotton picking in Western Arizona is nearly endcd, the season being fully six weeks in advance of last.

The farmers of Washington recently met at Toppenish and organized a hay growers marketing association.

On January 15 the shipment of Mexican tomatoes from Sinaloa began —an anticipated crop of 1500 carloads

Brazil is so short of farm hands that it will pay the steamer farcs for 3,000 German farm hands from Amsterdam.

The Yakima Valley of Washington expects a total output of about 4,000 cars of hay valued at about $250 per car.

One old hen near Portland has had her life insured for $5,000. Sbe claims the record of 330 eggs in 365 days.

Benton County, Oregon, recently held its annual corn sbow, its principal feature being an enormous corn castle.

High water in all Arizona streams is giving ranchmen a grand crop of fuel and fencing material from driftwood.

Arizona wishes congress to amend the immigration laws to allow temporary importation of cotton pickers from Mexico.

Short length stove wood at Jerome, Arizona, is selling at $42, a greater cost for fuel than pine lumber at prevailing prices.

Oregon farmers are trying out sunflowers for ensilage. Good old Indian corn is still considered the standard, however.

Middle West cattle owners have combined and secured the services of W. G. McAdoo and Francis J. Heney to fight the packers trust.

Tbe war department is about to release 34,000,000 pounds of frozen beef to the wholesale trade at 20 per cent below Cbicago quotations.

Of 21,000 brands on the books of the livestock sanitary board of Arizona but 5,000 bave been legally registered and no others will be recognized.

Oak Harbor Fruit Growers Association, Washington, has agreed to contract 80 per cent of its crop of berries at seven and a half cents for a period

The Multnomah, Oregon, fair directors have sold their fair grounds to the county commissioners, and hereafter the fair will be under the management of the county.

Tbere are at present 15,000 Mexicans in tbe Salt River Valley, Arizona, that are temporarily in the United States as farm laborers holding government permits as a war measure of five years.

A Letter From England

By J. Raine

KELSHAM Farm House, Headcorn, Kent., December 13, 1919. Sir: I have been sitting over my fire reading your paper which made its ever welcome appearance this morning. It is growing late; the winter wind is roaring in the great cavernous chimney of this ancient farm house; the breath of the wind is touched with ice; the Christmas is once more drawing very nigh, and tonight I happen to be alone.

As I look musingly into the flames leaping on the hearth I see pictures, and they are pictures of your wonderland. There comes over me a feeling of fascination. I have passed the halfway mark to the century, and I am a fairly busy man without much time for dreams, but the California that your paper tells of seems to have laid a spell upon me, and I feel that I would give a good deal to see the reality of the vision which is pictured in the flame.

* * *

Every week you send a message of interest, and profit, from the new world to the old; can not the old, for once, find something to say that will interest the new? Would it interest some of your readers that the house in which I sit chatting to them was an old, old house, a hundred years before the Mayflower sailed on her history making voyage. About the year 1450 this house was built. There are men and women sleeping in the church yard here who ate their Christmas dinner under this roof 300 years ago and more. When the first fathers of your country left these shores for a land of freedom for religious opinions, the astonishing event would no doubt be much debated by the good folk round this hearth, all wondering what the new Exodus might portend. How tongues would wag and heads would shake, tongues that have been very still for such a long time now, and heads which, we will hope, have now much better information on religion than we have.

These very old houses make one realize something of the "oldness" of England herself, the motherland of so many mighty peoples, children of which she is really proud beyond words, though like other mothers she has not always understood why her children should wish to be different, sometimes, from what she was. But she gets wiser as she gets older, and she understands quite a lot now.

* * *

Now for some of your readers who do not care a cent for old houses, but who may be interested in, say, raisins. Looking down at me from the old oak chimney shelf is a blue packet. On the packet is a gorgeous sun in full blaze. In front of it is a charming young lady carrying a tray of the very finest grapes. Under is "California Sun-Maid Seeded Muscat Raisins." What do you think about it? I found the lady of the grapes—where do you think?——in our village shop. I promptly invited six of her to go home with me. (34 cents a time. Is this about right?) Anything more delicious than the good things your raisin lady hands out I don't want to taste. I am steadily eating them, straight out of the packet, and if I don't get the raisin habit it won't be the raisins' fault. The order has gone forth that Christmas pudding, mincemeat, etc., are to be made this year of Sun-Maid raisins only.

Having shown you that my disposition is thoroughly friendly, not to say grateful, will you allow me to touch on two points which I think deserve your attention. I am told in several quarters that your raisins are rather too dark for our market. Our housewives have so long been accustomed to light colored raisins for cooking purposes that they do not take kindly to dark ones. Is it possible to cure your grapes in a way that will meet our tastes? It seems obvious that you wish to get your product on to our market, and—well I am telling you what I am told.

You have, I hope, accepted my suggestion in the spirit in which it is offered, and will perhaps allow me to refer to a matter which appears to call for serious consideration. The raisins I have been praising are those of the Sun-Maid brand, packed by the California Associated Raisin Company, Fresno. They certainly are quite excellent in every way, and though our women folk may take time to appreciate them, they do you nothing but credit. But there are California seedless raisins in our shops which do not do credit to their producers, and which the shopmen surely cannot sell, and which the women will most certainly never want, and no wonder. Today I was shown an opened packet of a certain brand, which was just a nasty mess. A yellowish, viscid, sickly looking matter was oozing out of the said mess, and —well the stuff was on offer for three cents less than what the tradesman had given for it. I asked the man why he didn't stock Sun-Maid brand. He said that he had had some, and had sold it, and it had given satisfaction, and he was sorry he could not get any more till 1920. (The color had not interfered with this man's sales, but still "one swallow does not make a summer").

Now this is how it strikes me. I think I have read that the majority of your raisin growers are members of the association. The article they offer is first rate, but the credit of the California seedless raisin is in danger of suffering through stuff put on the market by a comparatively few men who perhaps are tempted by an extra cent or two offered by some smaller concern. Those extra cents have to be got back somehow if the finished article is to be able to compete in the same market as the brand of the big association, which also has, by reason of its size, facilities for successful advertisement which the smaller concern can not command. One thing is certain, there won't be any repeat orders for the brand I am referring to.

I hope you don't mind my mentioning these two points; if I am in the wrong through incorrect information, please forgive me.

* * *

What a great business the cattle and dairy industry seems to be in your state. The milk and butter fat records you have made are well ahead of anything we have done so far, I believe. However, I don't want to touch on that side of the business now. Christmas is the time of fat stock shows with us. Is it the same with you? Scarcity and cost of foodstuffs make fattening a difficult problem at present, but still there have been some fine Christmas beeves—as our fathers would have called them—in the shows. Smithfield Show, London, is the most important, and has just taken place. The King's Challenge cup for the best beast in the show went to G. F. Cumming's grey crossbred heifer. The champion cup for the best steer or ox went to Alexander Reid's black crossbred which had previously won the championship at Edinborough. The Duke of Portland's white heifer won the breed cup for the best Shorthorn, which reminds me that over a million pounds has been paid this year for pedigreed Shorthorns, most of which have gone abroad.

Speaking of Smithfield, the first show was held as long ago as 1798, and the prize money only amounted to 50 guineas, but there were evidently some fine animals competing. An ox belonging to a Mr. Westcar, which won first prize, was sold for 100 guineas, and measured eight feet 11 inches long, six feet seven inches high, ten feet four inches girth, and weighed 300 stones (1,400 pounds). So the record runs. Some ox.

At Smithfield this week—this will appeal to your poultry men—a pair of Rhode Island Red cockerels won the pure bred championship in the dressed poultry section, for, I believe the first time.

* * *

As you may be aware Kent is the great fruit and hop county of England and this year must have nearly set up a record for both. Of course in acreage hops are very low compared with pre war days. Last year only 15,000 acres were under cultivation. Replanting is now proceeding apace, and it will not be long before we are touching the old figures again. The average price of English hops is 18 pounds five per 112 pounds, and imported hops are said to be almost as much, some people say more. You ought to be able to grow a fine sample in your climate; but what are you going to do with them now that you have suddenly become so virtuously abstinent? I rather doubt if a sudden conversion is a lasting proposition. I see that one of your big hotel men is over here trying to fix up a $20,000,000 palace for London. That will mean accommodation for quite a lot of your folk, and will be a sort of "home from home" on very high class lines. I haven't heard whether a liquor license is to be applied for. Well, I'm on the dry side anyway, though I sometimes think that I miss quite a lot.

However, there will be a very sincere and hearty welcome to all of you who are looking forward to a visit to the old country, and the more the merrier. Let me say here that if I can be of any assistance to anyone in providing information, or perhaps even in showing some of the interesting things that this county is rather proud of, please make use of me. I have perhaps unusual opportunities for offering some service to those interested in fruit and hops as I look after an experiment department for one of the largest firms of insecticide makers in the country, Messrs. Robinson Bros.

A prosperous New Year to California and to the California Cultivator.

About Tractors and Trucks

By James De Camp

WITH the growth of the tractor industry the buying, selling and trading of second hand tractors is becoming a separate and well established business. It is inevitable that, as has been the case in the used automobile game, a certain class of unscrupulous speculators will traffic in unreliable machines.

Remember that a man who disposes of an automobile or a tractor has a mighty good reason for doing so. If you are in need of a tractor and cannot stretch your purse over the price of a new one it is advisable to deal with one of the large agencies selling new machines.

These houses usually take in used tractors in trade for later models and in many cases will give some sort of a guarantee or term of service. A tractor thus purchased is sure to have been overhauled and supplied with any necessary new parts.

Tractor Operating Under Difficult Conditions
Tractor negotiating light sandy soil and walking away with eight-foot double disk.

It is true that many good bargains are advertised by the individual owner. Unless you have had mechanical experience it will be to your interest to employ a competent mechanic to inspect your prospective buy. Piston slaps, bearing knocks and serious ailments of like nature are not detected by the untrained ear of the layman. The period of service of a tractor is not recorded in terms of miles on a speedometer dial. The usage to which

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

MINDING OUR OWN BUSINESS

Perhaps the most popular pastime in the United States is minding one's own business. Hence, at the last meeting of the National Grange, 4,000 farmer members being present, it was unanimously resolved that the farmer wants to be "neither subsidized, patronized nor uplifted." He wants the gambler to leave his products alone and give him a fair chance in the market; likewise that he shall not be legislated out of existence. If left alone, the farmer will como across.

PLANT MORE TREES

Hundreds of tons of olives were ruined this season because of winds sweeping through the orchards at ripening time. Some of the fruit was gathered from the ground and made into oil, but it is poor consolation to grow big, fine table olives only to send them to the oil mill. No series of windbreaks would have saved all of this loss, hut a reasonablo planting would have lessoned it and the state ed many an individual grower bo the ther. It requires somo littie land to grow windbreaks, but there are some sections of the state where best results with horticultural crops call for this protection.

Plant a tree; plant a row of them.

KILL THE VARMINTS

The gassing of bugs on the trees will soon be over for a very few months, but the gassing of squirrels in their holes is now in best of form. Where the rains have been sufficient to moisten the ground wasteballs and carbon bisulphide aro used with deadly effect on the squirrels. Ground squirrels are costing the country millions. The state and the various county rodent controls should have fullest support on the part of producers, for the money which is saved will easily pay for the cost of the control and leave a large profit.

MORE WEATHER, PLEASE

"Present prospects," according to crop review report, "for 1920 crops are classified as 'good' ". And so they are, but we have our weather eye on the sou'east and are hoping with a very long hope for a wee bit o' rain. The extreme northern end of the state has had only about half its normal precipitation up to this time. The south is somewhat above normal as to total quantity, but its distribution has not been as satisfactory as in some other years.

On the other hand, it has been somewhat cold, and in some citrus producing sections "no smoking" signs have been ignored.

GREAT CITRUS FAIR

The National Orange Show people announce that it will be bigger and better than ever. It will open on February 13 and continue till the 23d. The show will not be near the center of town as heretofore, but at Urbita Springs a short distance south of it. Ten acres will be covered with tents and temporary structures, and the small lake in the park makes possible a water carnival. It is presumed the attendance of Easterners will this year be greater than ever. Nearly all of the citrus producing districts of the state have given assurance of participation. Every variety of orange, lemon and grapefruit, as well as hundreds of by-products, together with implements and working appliances, will be exhibited.

FARM EDITORIALS

Many men of many minds are required to make up a republic. This republic of the United States has the goods. The time was when there were two very decided factions; one believing in abolition, the other in slave holding. That was our most serious difference of opinion. The question was settled, however, and both sides now agree it was settled right. Numberless other questions have come along. Some have been settled and some are up for argument. Today we have the League of Nations, prohibition, labor, and most of us on the Pacific Coast are hoping we may have a more general discussion on the matter of America for Americans. The Cultivator has touched upon this somewhat, and has brought out letters of commendation—or otherwise—and these letters make excellent farm editorial reading. The first one is from Edwin S. Petorsen of Altadena. He writes:

"In the discussion now going on about the Japanese, let me commend your moderation and evident desire to reach a conclusion calmly. Hysteria and yellow journalism can do no good, although both seem to be the ordinary spirit in which our papers discuss all vital questions.

"If the Japanese are a menace, of course, the United States has a right to meet the matter—no one questions that. On the other hand, there is a serious lack of labor in the state, and as long as that remains acute cost of living will stay up. This lack is on the increase for many foreigners not caring to live longer in a country of prohibition are leaving in large numbers. Los Angeles, I am told, has lost over 3,000 Italians. And in spite of all cries to the contrary, there are no vast hordes waiting to come here from Europe. Those who do leave Europe are bound for South America where the financial gain is as great and life less trammeled by Puritanical laws. With the loss of over a million workmen gone back to Europe, and the desire of many of our citizens to send the Japanese and Mexicans back to their countries, I ask you who is going to pick the oranges and lemons, as well as do the many similar tasks. The real Americans? I doubt it."

As Mr. Petersen says: "The United States has a right to meet the matter if the Japanese are a menace." Likewise, we may say the country has a right as to prohibition or other question which concerns all the people.

If booze is a menace, as the great majority of our people seem to think, it is wiped off the slate. The majority has ruled, as it must continue to if we remain a republic. As to the solution of the labor question it will be a long time before it is entirely solved, but there is a suggestion on this page.

A San Diego County subscriber, who requests that his name be withheld, writes:

"I read with great interest those articles in the Cultivator about the Japanese invasion of California. There is one point which no one seems to consider and that is the Japanese will not sell land in Japan to Americans, so why should Americans sell their land to the Japs? My informer was a Japanese man of the educated class. He said Japan was held for the Japanese only (if this is not correct I should like to know). He also said the word of his countrymen was not to be relied upon and that they could be very cruel, which we see is true from the accounts we get of the treatment they deal out to the Chinese of Shantung today. What virtues they do possess are actual dangers and weapons to be used against the Americans in some future time if the Americans tolerate them now. They have, in a way, so impressed the world with their good qualities that many people are quite blind to their bad qualities.

"Go ahead with those articles and may they open the eyes of those who are indifferent to the situation."

C. D. Hubbard of Santa Barbara County feels that more definite and immediate action should be taken by each one of us. He writes:

"I consider this the most serious matter that has ever come up in California and the United States. If our laws could only be made with the idea of the good old U. S. A. for white Americans and laws for right and justice instead of political and financial and selfish gain. I would like to join a club and take an oath something to this effect: 'I promise never to buy, rent or lease anything of a Jap or to hire a man, woman or child Jap, or sell, rent or lease anything to a Jap.'"

FARM LABOR PROBLEM

The farm labor problem is yet to he solved, that is, its solution is yet in the future unless the American has determined to allow the Japanese to settle it for him. Discussing this matter, the Los Angeles Times asserts that white workers prefer other employment, especially that where the more arduous work is performed by machinery and the mechanic furnishes the brains, and then regrets that the days of "hard labor" on the farm are largely over for white people. "Crops must be tended by hand; there must be laborious hours in the sun, employment of muscle rather than of brain. It is a wearying occupation."

We do not agree; we believe the most inspiring and noblest of all work is out in God's open, growing food and raiment. There is no more universal yearning than that of the human shut up within four walls for an opportunity to be out in the sunshine tilling the soil, but the trouble has been in the matter of compensation. The competition has been too keen and others who like the life of the outdoors were willing to forego many things which the American deems essential, and he was undersold and ultimately driven from the land. He will go back to it quickly if given the opportunity to earn honest bread and butter. However, the Times continues the discussion of the labor question from a new angle, so we quote liberally:

"So long as the Japanese continue to control the production of food stuffs in California there is no prospect of a reduction in the cost of living. Japanese labor is not cheap labor. The little brown traders know how to get as much for their products as the traffic will bear. The average price of vegetables has increased 200 per cent in five years. So long as the Japanese control production they will fix their own prices; and despite the so-called 'gentlemen's agreement' restricting Japanese immigration, Japanese workmen continue to find their way by the tens of thousands yearly to the agricultural districts of California. What is the remedy?

"There is a single source of adequate supply of labor to cultivate the idle acres of California at this time. That supply is to be found in China. The Chinese coolie offers the only present defense against the Japanese industrial invasion. The hasty reader will exclaim that the oriental menace would not be lessened if Chinese farmers were to be substituted for the Japs. But between the two there is a vast difference. The Times reiterates its suggestion that the Chinese Exclusion Act should be suspended for a period of three years; and that Chinese farmers should be permitted to come to this country to work for a three-year period, under contract to return to China at the end of that time.

"Once a Japanese gets into California through the meshes of that gentlemen's agreement, he stays here. He takes up land, holds it in the name of his offspring hy a picture bride, and the acres which he occupies are lost for all time to the white race. With the Chinese a different arrangement can be made. Bringing them to this country on a three years' contract to work does not mean giving them permanent residence here. At the end of that three-year term they must return to their own country. They do not become a menace to white sovereignty. They are a present help in time of need.

"If a machine were to be invented which could do all the arduous work now performed by hand on the farm it would be welcomed as a Godsend. That machine would mean increased production and a lowered cost of living. Why then the protest against employing a human machine to do the work? Who would he injured if 1,000,000 Chinamen were brought to this country to work on the farms or where needed, and if 100,000 of them were to be employed in California? They would replace none of the white workers in California industries. The only ones to be affected would be the Japanese farmers. This influx of Chinese workmen would break the Japanese corner on the food market. The workers of the city would be able to live for less. The grocery and vegetable hill of the average Los Angeles housewife would he cut in half within a year; and not a singie white person in Los Angeles would bo thrown out of employment. Why are we shrinking from a solution of the labor problem which would be of such general benefit?"

Copyright 1920, by The Goodyear Tire & Rubber Co., Akron, O.

"SINCE I changed over from solid tires to Goodyear Cord Tires, my motor trucking to Omaha, 31½ miles, has improved tremendously. I now deliver livestock in less than half the time, and with shrinkage greatly reduced. At 15,000 miles, my Goodyear Cord Tires look well able to travel much farther." — Roy Stokes, Rural Motor Express, Loveland, Iowa

HERE is a case, like many others, where the traction and cushioning of pneumatics help farmers to get better prices by making safer and more dependable deliveries.

It is consistently reported that pneumatics enable shippers to reduce the shrinkage of livestock in transit and to unload at stockyards on time despite weather conditions.

The scarcity of help is not such a handicap to these farmers, because they have thrown off the other handicap of slow hauling, either by teams or on solid truck tires.

They haul more loads per day on pneumatics without additional hands, and also get more work from their power-driven machinery, because a truck on pneumatic tires is the quickest feeder for this machinery.

The development of Goodyear Cord construction, extending over many years, has made the pneumatic principle most effective because it has given to the Goodyear Cord Tire a remarkable toughness.

Additional information, showing how farmers save drudgery and increase income with pneumatic-tired trucks, can be obtained from the nearest Goodyear Truck Tire Service Station, or by writing to The Goodyear Tire & Rubber Company, at Akron, Ohio.

GOODYEAR

CORD TIRES

The FRUIT GROWER says=

"for tree planting genuine GIANT is most satisfactory"

The Giant Farm Powders—Eureka Stumping and Giant Stumping—loosen and pulverize the soil instead of packing it and throwing it high in the air.

Western fruit growers have used hundreds of tons of these Giant Powders for blasting beds for trees. They have proved that blasting with genuine Giant Powders provides free drainage, increases moisture-storage capacity and insures vigorous growth and early bearing.

"My trees planted three years ago in beds blasted with Giant Powder are 75 to 100 per cent bigger and better than the trees that I planted in dug holes," writes H. H. Smith, Oregon City.

You will enjoy reading "Better Farming with Giant Farm Powders." It describes all the new and money-saving methods of blasting beds for trees, subsoiling established groves and orchards, clearing land, ditching, etc. Write for it now.

Harvest 20 to 45 Bushel to Acre Wheat in WESTERN CANADA

Think what that means to you in good hard dollars with the great demand for wheat at high prices. Many farmers in Western Canada have paid for their land from a single crop. The same success may still be yours, for you can buy on easy terms.

Farm Land at $15 to $30 an Acre

located near thriving towns, good markets, railways—land of a kind which grows 20 to 45 bushels of wheat to the acre. Good grazing lands at low prices convenient to your grain farm enable you to reap the profits from stock raising and dairying.

Learn the Facts About Western Canada

—low taxation (none on improvements), healthful climate, good schools, churches, pleasant social relationships, a prosperous and industrious people.

Olives and Grapes at Hemet

By Ernest Braunton

DOWN in the Little Laks district four miles east of Hemet the Riverside County farm bureau held a pruning demonstration on the Wilson and Moulton ranches, January 5. The subjects for surgery were olive trees and grape vines and the operating surgeon was Prof. F. T. Bioletti of the state college of agriculture. About 50 persons were present from nearby ranches, with J. E. Wherrell, president of the Riverside County farm bureau, R. M. Wilson, farm adviser, and R. E. Neblung, assistant adviser.

The first tree pruned was a large Mission olive 27 years old in an orchard where every other one had been taken out three years ago and those left are still too close together. These trees are very tall, of many stems or lowly divided trunks. Prof. Bioletti said the sole determining factor in topping them should be the cost of picking the crop. "Do not merely top such trees for you will cut away but half of the growth and a lot of new shoots will spring up to take its place and grow higher still. Cut down ten or 15 feet, perhaps more, and make a new head. Cut out the main upright just above a strong branch pitching outward and remember the reduced cost of picking must justify the expense of this topping or it should not be done. But either top heavily on large trees or not at all. This will encourage lateral growth, and judicious thinning annually will develop a heavy crop of olives much nearer the ground.

"Cut out old centers on any trees and encourage side branches, but each year thin, thin, thin. The sun and air must get in, so thin until you can see through all parts of the tree. While topping is occasional, thinning must be done annually. There are no specific rules for pruning olives; the main object to be obtained is a well-thinned tree."

At this point Prof. Bioletti was asked the cause of olives shrivelling on the trees about November. He said it was due to cold winds when the soil has become so cold that the roots will not function well and cannot therefore pump water to the fruit and foliage to overcome the exhaustion by the drying wind. This is technically a physiological drouth. A physical drouth is one where sufficient water is not present in the soil, but a physiological drouth is one where sufficient water may be present but the tree cannot use it because of partial dormancy of the feeding roots, caused in this case by reduced soil temperature."

Young Olive Trees

The next pruning was of three varieties of younger trees six years old, the first a Manzanillo. "This variety," said Prof. Bioletti, "is a drooping one and seldom grows too high. Open up the center, thin well and cut away the larger drooping branches. If this were a Mission I would not cut the lower branches so much as the growth is more upright." By the time Prof. Bioletti had said this much the tree was nearly pruned, the whole operation not requiring more than five minutes.

The next subject was a Mission. "Do very little pruning until five or six years of age. Leave the center growth until the side branches have got their proper angle. If you prune out before this takes place, when trees are young, the side branches will grow in toward the center, as the tendency of the Mission is to make upright growth. But thin, always thin, for three things: First, to let in sun and air so a well distributed crop will set; second, so too many olives will not set; third, to encourage good growth for next year. Again, do not be particular how you prune so long as you thin. The Ascolano is a straggly grower, also needs cross-pollination, and doubtless all olives would be better for it, too. This variety will droop, and at two years old it is better to tie the trunks and branches to stakes and keep them thus upright for two years, after which they will have become fairly fixed for proper position."

Fertilizing and Irrigating

Asked about fertilizer he said he had little to say for if soil is good olives need little or no fertilization but if they are fed a nitrogenous fertilizer only is needed, but a well chosen olive soil should not need fertilizing or the game is not worth while. Asked as to irrigation he said three irrigations are necessary if rainfall is insufficient but the first one need not be given in case of sufficient precipitation. The first should be to start the growth, in January or February; the second two or three weeks before time of blooming, in the Hemet section about April. The third application is for sizing up when the olives are half or two-thirds grown. Olives should be irrigated infrequently but heavily.

Grapes

The first grape pruned was a Thompson Seedless that had been left too long and built up too high. This variety is long pruned. "Leave fruit canes two to four or even six feet long, weak spurs to one eye, medium spurs two eyes, and strong spurs three eyes, or an average of about two. Also leave a strong spur near the base of each fruit cane (if present) so it will make the fruit cane for next year, for the old one should be cut away. Ninety-five per cent, rather more, of each season's growth should be cut away. Leave three to six canes, according to manifested vigor of vine and never use any but the one-hand pruning shears; the two-hand or hedge shears often split the canes and especially the spurs. Every vine or long-pruned grape should have a stake or trellis, and the latter is much the best. Canes of horizontal growth will sometimes break in pulling up to a stake, which they would not if fastened to a trellis. In staking take canes in both hands, and beginning at base keep bending them sharply all the way up in the direction you wish to draw them. This distributed bending will prevent snapping at one point and will check the sap flow so it will start growth all along the cane. Otherwise, and if tied upright, the sap will rush up and make the growth nearly all terminal. The best trellis is two wires strung 24 and 40 inches above the soil, the lower for the canes and the upper to care for the upright laterals."

The answer to the last question brought books and scraps of paper from pockets of nearly all present. The question was: "What are the best grapes for a family vineyard in the south?" The answer was: "I will give you three grapes in three classes, a white, a red, and a black in early, medium and late season, though there is no good flavored late grape. Nearly all these are new ones, but the best, and all but Black Monnukka and California Concord, or Pierce, are to be short pruned. The early varieties are: Kahlali, Duke of Magenta, and Black Monnukka, being white, red, and black as named, as are the other classes. For medium plant White Queen, Marvel of Malaga, and Black Muscat, or perhaps the Pierce where the Black Muscat is not good. In late varieties use Verdal, Gros Guillaume, Gros Colman or even Black Cornichon. One may get not more than two each of the new varieties from University Farm, Davis, for five cents a cutting so long as they last. Better allow them to substitute in case of shortage. Use these buds for grafting, to gain three or four years in fruiting. Or if grown from cuttings plant up near house and water well once a month. Next season the rooted cuttings may be set in permanent position. At Davis we have 400 varieties."

BLUE RIBBON PEACH NEWS

The California Peach Growers Inc. begins the new year with issue of Vol. I No. 1 of Blue Ribbon News, a house organ. This is for circulation among the members of the association and is full of live stuff of news interest to the peach grower.

"Through the columns of the Peach News we will endeavor to keep the membership informed from time to time on crop and market conditions, as well as to convey to each member any special report we may have on the progress and affecting the general welfare of the association."

Our Job

THE LIST of motor cars below is not merely impressive evidence of Willard leadership—but of a three-fold Willard responsibility—fully realized and fully accepted.

As the leader of a great industry, Willard is held responsible, and rightly, for storage battery improvement, for storage battery service, and for giving all necessary help and information to the great car-owning public.

And to make the new Willard battery owner's task easier, in addition to our responsibility for the quality of material and workmanship, we offer to all such as properly register the new battery at a Willard Service Station, a 90-day insurance free of charge. Besides that, any car owner can at any time obtain full and complete printed information on every point he needs to know.

The Nation-wide Willard Service Organization was established and is maintained for the car-owner's benefit, to assist him in getting a really trained service by men who know their job.

The lastest of many Willard contributions to battery improvement is the Still Better Willard with Threaded Rubber Insulation—an invention which entirely does away with what was previously an almost universal battery repair expense—re-insulation. Our one objective is the car owner's complete satisfaction, and this we pledge to those who make or sell motor cars and to the millions of men and women who drive them.

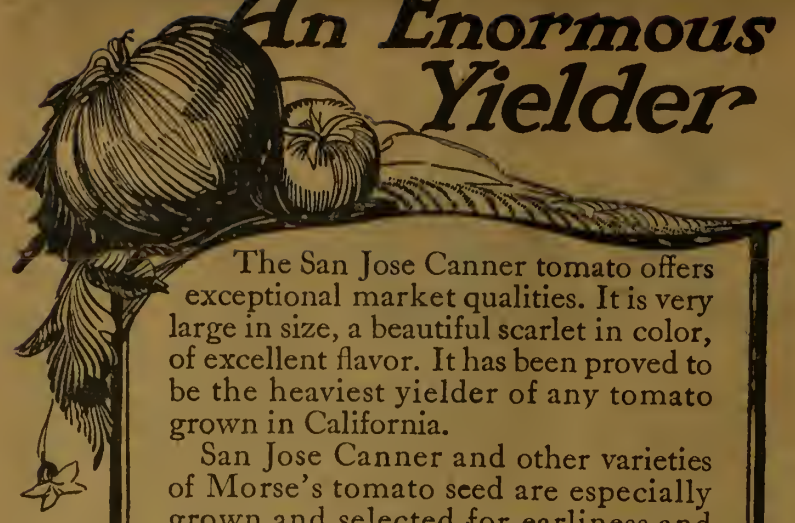
WILLARD STORAGE BATTERY COMPANY, Cleveland, Ohio

T. A. WILLARD, President

Willard STORAGE BATTERY



An Enormous Yielder

The San Jose Canner tomato offers exceptional market qualities. It is very large in size, a beautiful scarlet in color, of excellent flavor. It has been proved to be the heaviest yielder of any tomato grown in California.

San Jose Canner and other varieties of Morse's tomato seed are especially grown and selected for earliness and yield.

Like other Morse seeds—our tomato seed is *soil-tested*. That means that seeds are planted in the soil (not on a blotter or cloth) and we count the number that sprout. Morse's seeds are alive. They grow. They yield large crops.

Write us for quotations on any kind of field or farm seed. We operate the largest seed farms in the world. Consequently, you'll always find it profitable to get our prices on Morse's Grand Prize seeds. Send us a list of your seed needs today—and ask for our free 1920 Seed Guide or catalog.

ABOUT TRACTORS AND TRUCKS

Continued from Page 77

the outfit has been subjected can only he determined by the inspection of an experienced person.

In most cases a brand new tractor will be found cheaper in point of service and upkeep than the second-hand hargain. Many have found it a wise financial step to purchase a new tractor on terms rather than invest the cash at their disposal in a used machine.

The tractor industry has a future comparable only to that of the automohile business. Dealers in used automobiles have heen forced to hand together for protection against curbstone vendors and "fly-hy-nighters" who concealed "shot" bearings hy filling motors with heavy steam engine oil and are even alleged to have used an oil containing a high percentage of pulverized cork.

If your tractor is given one-third of the consideration accorded a horse, repair bills should he a curiosity. With the rainy season here it is in point to remark that a tractor left standing in the field through storm and shower will not perform with maximum efficiency and depreciates rapidly in value. Rust and exposure are deadly enemies of service while moisture often causes expensive short circuits.

Tractioneering is becoming a recognized profession. Many localities hoast of a plowing and cultivating contractor who will undertake piece work, using his tractor or tractors. Others, doing business on a larger scale, ship their machines ahout the state, working in the San Gahriel Valley one month and the Sacramento the next. These "taxis of the soil" prove convenient and economical for the man who does not own a tractor or has more work to do than his equipment can handle. It is reasonahle to predict that those living near the larger towns will soon be able to rent tractors without an operator, just as automohiles are hired out by the day, week or month without a chauffeur.

Accredited tractor schools are turning out qualified tractor mechanics. Many garages in the smaller towns now display signs, "Tractor Expert," or "Tractor Work Done Here."

The census of 1920 will demonstrate that Old Dohhin is not yet to be classed with the downtrodden buffalo. However, there will he a tremendous decline from the figures of 1910 in the number of his kind registered. The spread of the automobile retired the horse to the stronghold of the farm, which has since heen successfully invaded by the tractor. The tractor movement is of such recent growth that it has not had opportunity to make itself felt seriously at the time of the present census.

Figures compiled several months ago hy the sanitary bureau of the hoard of health of New York City show that 41 per cent of the horses accredited the metropolis by the census of 1910 have disappeared at the present time.

Users of solid motor truck tires seem to consider that the "feet" of their machines need no attention whatever. Mileage may he prolonged by treating cuts and chipped places at the side of the tread with cement and tire putty, just as a pneumatic casing is taken care of.

GRAFTING WALNUT TREES

Continued from Page 75

times termed. They can he kept two months or can he cut and placed in the tree at once with equal success. Any wax that will adhere to the wood without cracking or running and without any free oil to soak into the hark is equally good. Scions of mature wood of the last year, whether one-eighth or five-eighths of an inch in diameter, are equally good when properly placed. One part of the twig from which the scions are cut is as good as the other provided the wood is mature and the end huds are as good as those on the side and vice versa.

The Illinois experiment station made a series of experiments with fruit trees to determine whether there was a difference in propagating from large or small buds or whether cuttings from different parts of the tree had any influence on growth. The conclusion was that all huds from healthy wood were equally good, so far as growth of trees was concerned, and that there is no tangible basis for the assumption that large scions are superior to small diameter scions for purposes of propagation.

Turlock cantaloupe growers are receiving their supply of seed from Colorado.

~a farm-business machine

Built into every "Caterpillar" Tractor is a big, sound farming-business principle: lowest cost per working hour.

To the manufacturer this principle demands the construction of the very best, the most efficient machine manufacturing skill can produce—a machine accurate to a hair's breadth in every detail—one that stands up under the heaviest work any tractor can be called upon to perform.

To you this principle means that the "Caterpillar" Tractor will pay back in shortest time every dollar you invest in it. It is a farming-business proposition pure and simple. It enables you to plow better and more economically; it enables you to cultivate better and more economically; it enables you to harvest better and more economically.

"Caterpillar" Tractor owners all over the world have proved the truth of these statements. The "Caterpillar" Tractor's record in war and in peace is a story of exceptional performance at lowest cost per working hour.

If you are interested in cutting down your farming expenses by modern tractor methods—write today for the story of the "Caterpillar" Tractor so that you can judge for yourself.

ADVERTISING OLIVES

A constructive program looking to the greater development of the ripe olive industry of California through national educational advertising of olive products is about to be put into operation by the California Olive Association. This organization, composed of olive packers and growers from all parts of the state, represents in its membership more than 75 per cent of the olive tonnage of California. The association is being incorporated to enable it to undertake the work of market development and articles will soon be filled with the secretary of state.

The cost of advertising which will be conducted by the association is met by an assessment of $5 per ton on all olives grown and packed by the members of the state wide organization, the growers and packers each contributing to the fund in equal amount. The advertising policy is determined by the advisory board of the association, and this board is composed of three of the largest and best known growers and packers of olives in the industry. The members of the advisory board are: Frank Simonds, Los Angeles Olive Growers Association, chairman; B. B. Meek, Mt. Ida Packing Company, Oroville; R. C. Merryman, Exeter, the latter one of the largest growers of olives in the San Joaquin Valley.

"While the present membership of the California Olive Association takes in more than three-quarters of the packing concerns in the olive business, we will add several large firms to this number in the next few weeks," writes J. J. Hoey, secretary of the association. He adds, "The fact that our work of market development for olive products is to begin at a most logical period in the development of the industry, when it is apparent to all that we must provide markets ahead of our rapidly increasing production, and furthermore, that the cost of this work is distributed equitably over the industry, insures the support for this movement of almost every factor in the olive business."

CURING OF LEMONS WITH VASELINE

A Scone orchardist, anxious to keep some of a good crop of lemons for summer use, recently sought information as to the efficacy of a vaseline treatment and the comparative values of curing treatments. The department's reply was as follows:

The following experiments with Washington navel oranges and lemons were carried out fortnightly, commencing June 14, 1918, and ending August 7, 1918, at Yanco experiment farm:

Fruit wrapped and packed in paper lined cases, also in sand; fruit vaseline and packed in paper lined cases, also in sand; fruit unwrapped and packed in paper lined cases, also in sand; fruit dipped in borax and packed in paper lined cases, also in sand.

The results from those unwrapped and those treated with borax were not satisfactory, those that had received a coating of vaseline keeping best of all. The lemons so treated kept in perfect condition from June to January, though it would not be advisable to store for market past November on account of the deterioration of the fruit beyond this month.—Agricultural Gazette, N. S. W.

FIGHT GRAPE MEALYBUG IN JANUARY

January has been found to be the best month for attack against the grape mealybug, says the bureau of entomology, United States department of agriculture. Fumigation with cyanide of soda and with sulphur fumes has been satisfactory in the dormant season at night, but sulphur is considered better. Spraying has proved less effective than fumigation. A campaign among grape growers has been begun to secure their cooperation in restricting the spread of the pest on picking boxes and in other ways.

PROFITABLE APPLES

One of the newer producing apple sections is that of Greenfield, Monterey County, in a sense an extension of the Pajaro Valley apple section. The Greenfield fruit has been commanding higher price than that from most other sections of the state during the past season.

ORANGE TREE RECORDS

A. D. Shamel states in some of his talks on bud variation and bud selection that William Hertrich, superintendent of the H. E. Huntington ranches in the San Gabriel Valley, has the most complete set of records of orange tree performance on a large scale. With this statement in mind a member of the Cultivator staff spent some pleasant hours looking over these records, also those pertaining to fertilizers and packing house returns.

The experience of Mr. Hertrich calls to mind a remark made by C. C. Chapman of Fullerton. He was asked how he could afford to apply so much fertilizer to his orchards and his reply was: "How can I afford not to?" Some of the Huntington trees have been well fed and those best fed paid the best returns.

Value of Fertilizing

On a block of Valencias 25 years old with 69 trees to the acre, the application of fertilizer cost $1.72 per tree, total including everything, even cost of keeping records. This is $119.86 per acre. This was in 1917 and the treatment was much the same in 1918. The 1917 crop was 697 picking boxes per acre. The 1919 crop was 5,758 picking boxes to the acre. The 1918 crop is not given because it was a year of small crops everywhere, with high prices, so the monetary returns were satisfactory. Furthermore the fertilizing given in 1917 and followed in 1918 would show the full effect only in a two year lapse.

Many will be interested to know what was applied to these trees for the crop production in the average orchard in that neighborhood, on old trees, in 1917 and 1919 was about the same in quantity. Ten pounds of tankage was applied in March and a like amount in July; 200 pounds of Riverside lime rock in August, and 920 pounds of stable manure later in August. In September a cover crop Melilotus Indica, was sown, using 15 pounds to the acre. The figures given for fertilizer are per tree. The application of stable manure may seem considerable but it is only a pound and a half to the square foot. When fertilization and crop are figured against each other it shows that the investment has proven a good one. On orchard blocks where heavy applications were made year by year, heavier by far than those herein quoted, the returns were excellent. As an example, one block of trees which in 1918 cost $2.81 for food, returned a net profit of $16.03 a tree.

Crop Performance

On one ten acre block there were 666 trees 25 feet apart, the place of the other 24 trees being taken by a building. Of this number in 1918 there were six trees that bore one box of oranges; 13 trees, two boxes, 18 trees three boxes; 18 trees, four boxes; 29 trees, five boxes; 49 trees, six boxes; 53 trees, seven boxes; 71 trees, eight boxes; 121 trees, nine boxes; 105 trees, ten boxes; 65 trees, 11 boxes; 57 trees, 12 boxes; 37 trees, 13 boxes; 16 trees, 14 boxes; five trees, 15 boxes; two trees, 16 boxes; and one tree, 18 boxes. In another block of better performance three trees bore 19, 21, and 23 boxes each. These are one year's records. If three years' records show similar results those trees falling below the average of the figures given will be beheaded and top worked with buds from some of the best yielders bearing high grade fruit.—E. B.

FERTILIZE RAISIN VINEYARDS

Vineyard fertilization is perhaps the most essential thing confronting the raisin grower at this time if he wishes to continue his success, according to Fred K. Howard, consulting horticulturist for the Associated Raisin Company. In fact the need of applying plant food in some form is no longer questioned by most growers. The essential thing is to determine, if possible, what the soil needs to produce good crops.

According to Howard the matter is seriously affects the quality of the product that the association is prepared to meet the grower a little more than half way. Upon request fieldmen will call and obtain soil samples which will be tested and recommendations based on the results of the test will be given to the grower.

The Keynote to Bigger Profits

Spraying is not an expense —properly considered — but an investment that pays for itself over and over again by producing more and better fruit and bigger profits.

But spraying must be done properly—at the right time, in the right way, with the right materials.

For example, there's nothing better for a dormant winter spray than Universal Brand Crude Oil Emulsion. It cleans the limbs of insect pests. It softens the bark and makes your trees healthier and more productive.

We have a hulletin covering the whole prohlem of insect control in deciduous orchards. Write for your copy today — a post card hrings it.

PLANT QUARANTINE SERVICE

The state quarantine law provides that: "When any shipment of nursery stock, trees, vines, plants, shrubs, cuttings, grafts, sicons, buds, fruit pits or seed or vegetables or fruit, imported or brought into this state, is found infested or infected with any species of injurious insects, or their eggs, larvae or pupae or other animal or plant disease or there is reasonable cause to presume that they may he so infested or infected, which would cause damage, or be liable to cause damage, to the orchards, vineyards, gardens or farms of the state of California, or which would be or be liahle to be detrimental thereto or to any portion of said state, or to any of the orchards, vineyards, gardens or farms within said state such shipment shall be immediately destroyed by the state commissioner of horticulture, his deputy quarantine officer, quarantine guardians or other person or persons, who shall be commissioned by the state commissioner of horticulture, to make such inspection." It is further provided that under certain conditions such shipments may be sent out of the state. A careful study of the state quarantine law will show that quarantine officers are only given authority to inspect plant products to determine the presence or possible presence of "any injurious insects, or their eggs, larvae or pupae or other animal or plant disease." This law in no way grants authority to reject plant products because of poor physical condition, such as natural decay, sunburn or frost. The authority granted us to reject plant products offered for entry into California should be used with discretion, not abuse.

SPLIT ORANGES NOT STANDARD

The Fresh Fruit Standardization Law states that oranges when packed or sold shall be virtually free from insect and fungous diseases and other serious defects. Superintendent of Standardization A. W. Hoyt of the state department of agriculture has ruled that split navels are to be classed as serious defects. This is quite a proper application of the term and Los Angeles County inspectors are instructed that all splits showing fungous infection, decay, softening of the tissue of the fruit or injury extending through the rind into the fruit itself so that the orange is reudered susceptible to immediate rot infection and decay are harred, and such injuries should be classified as serious defects."

The inspector of fresh fruits will go far toward securing equitahle enforcement of standardization laws as applied to all comodities if he will try to maintain the viewpoint of the consumer, bearing in mind that the continued welfare of the producer is dependent upon the continued satisfaction of the customer.

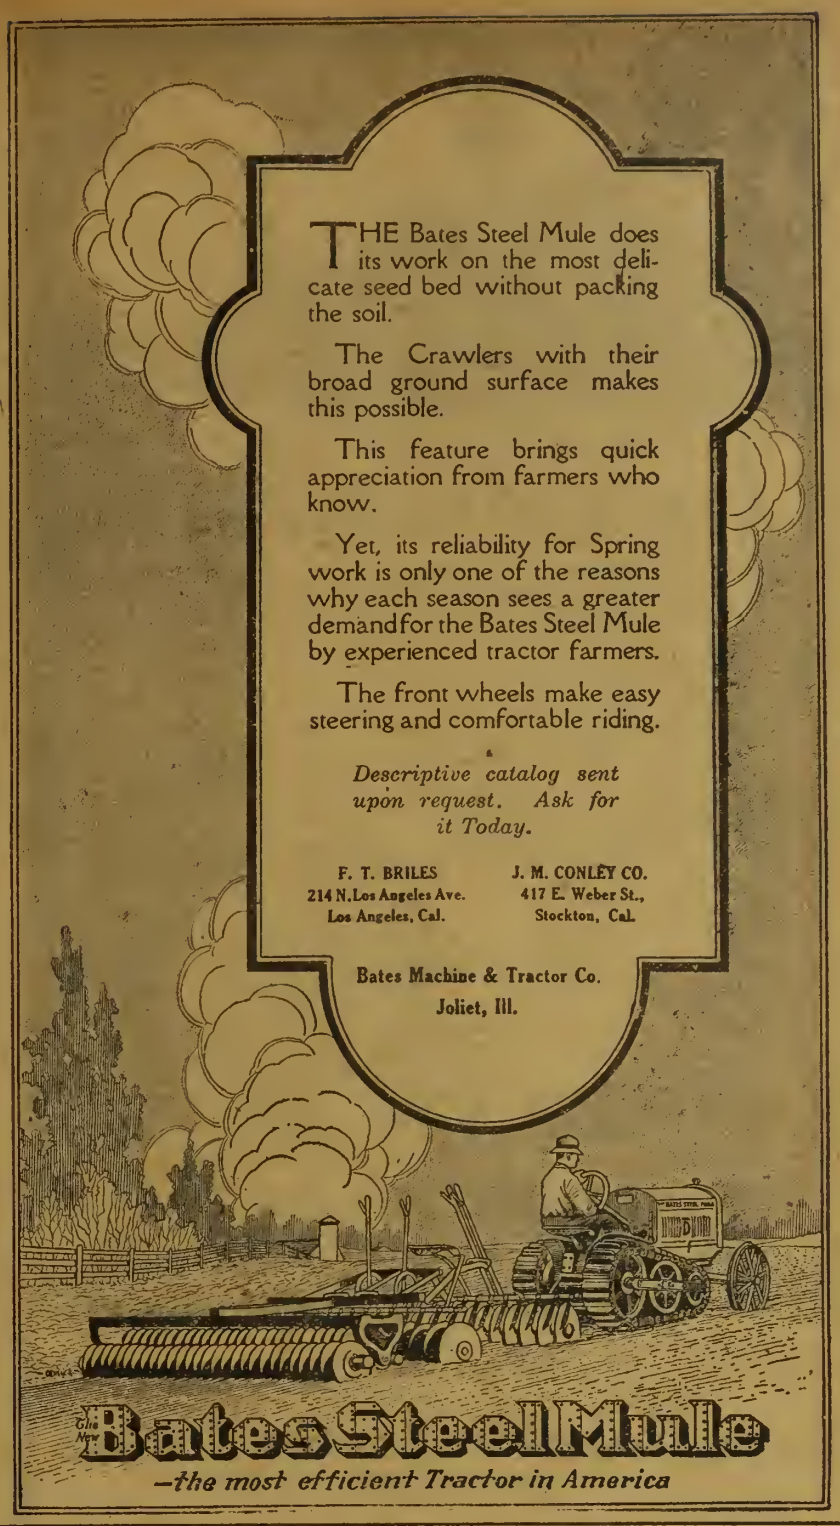
CITRUS CANKER CHECKED IN FLORIDA

Citrus canker, which had beeu effectively excluded from California hy a rigid quarantine, is now reported to be checked in Florida, as shown by a report just issued hy the state plant hoard. This disease threatened at one time to wipe out the entire citrus industry in Florida hut through the efforts of the plant board there is little if any danger of recurrence of this dreaded danger though there is not yet certainty that it is all stamped out.

The report shows that in May, 1914, 13,727 trees were found to be infected with citrus canker. At this time the plant board was formed and put forth to cope with the situation. The task looked as if it would be herculean, but the board went to work and it will be seen from the report that they have been successful, as in May of 1919, there was found only one tree infected.

During the five years in which the plant board has been in operation, 342,254 trees have heen found to be infected. Of this amount 234,998 were destroyed hy permission of the owners. The trees destroyed were burned on the premises. Nursery trees destroyed during this time amounted to 2,613,514.

The Arizona American-Egyptian Cotton Company of the Salt River Valley is planning a bonded warehouse and compress to cost $250,000.



THE Bates Steel Mule does its work on the most delicate seed bed without packing the soil.
The Crawlers with their broad ground surface makes this possible.
This feature brings quick appreciation from farmers who know.
Yet, its reliability for Spring work is only one of the reasons why each season sees a greater demand for the Bates Steel Mule by experienced tractor farmers.
The front wheels make easy steering and comfortable riding.

We Specialize in Fruit Bearing Trees

We grow our trees in the choicest spot in California—Fresno. Here in Central California the most favorable climatic, soil and water conditions prevail, making possible the production of superior trees and vines. Added to this is our intimate knowledge of the business which enables us to exercise the most intelligent care in growing and handling nursery stock.

You should have our catalogue. Our descriptions of varieties are more complete and comprehensive than in any other book. It tells you what you ought to know in order to select trees intelligently. Sent free on request.

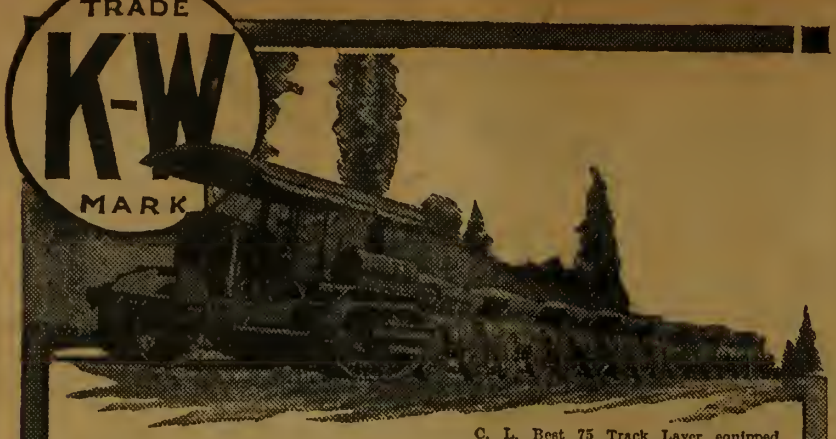
TRADE K-W MARK



C. L. Best 75 Track Layer equipped with K-W Magneto, pulling up grade with 70 tons of rock.

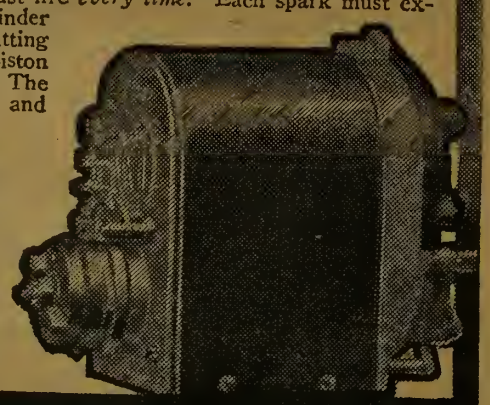
A Sure Spark for the Hard Pull

TO start this dead load of seventy tons and to keep it going steadily up grade requires extraordinary power and an absolutely "sure fire" magneto.

Like most tractors built to give unusual service this "Best 75" has a K-W Magneto.

When a gas engine has a light load and can speed up it is easy to generate the spark. The engine will even go in spite of an occasional miss or weak spark.

But on this job as on most tractor work the pull is slow and heavy. *Every cylinder* must fire *every time*. Each spark must explode all the gas in the cylinder completely and quickly putting the full punch behind the piston at just the proper instant. The K-W Magneto *does* this and *continues* to do it.



Write for booklet showing the simple construction of the K-W Magneto explaining how it makes your tractor do more work on less fuel.

THE K-W IGNITION Co. CLEVELAND, OHIO, U.S.A.

The Winter Garden in Southern Arizona

By M. E. Bemis.

ONE hesitates in these times to urge a general home gardening campaign. In the war period when food was scarce it was a matter of patriotism and one who produced in his own garden a part of the food for the family table felt that he was doing his bit to win the war. In passing it may not be out of place to say that this collective effort of many individuals was not without its result and with the hundreds of other denials of millions of people contributed in no small degree to the ending of the war.

Now we lack the patriotic appeal but still have an advantage from the economic standpoint; the benefit in health due to a larger use of vegetables and the convenience of having fresh food are all as applicable now as ever. It is a little hard to convince the farmer who is making so much money in raising cotton, or some other crop which is farmed on a big scale, that he feels his time to be worth $10 to $25 a day, that he should spend any considerable portion of that day in raising a few radishes or squash or a few turnips. As well, almost, undertake to persuade the president of a bank that he would save money if he would do the janitor work himself.

But not all farmers are in the above class. There are yet a good many—shall I say "old fashioned"—farmers that think a farm incomplete without a garden. To those a small amount of information may be helpful at this season of the year when the brightly covered seed catalogues are beginning to make their appearance.

At this time of the year the spring garden should have attention in Southern Arizona (except the higher elevations) and in the Imperial Valley of California. The variety of vegetables and the ease with which one may raise them in the Southwest is a constant delight as well as a surprise to Eastern people. Most of the older residents take it as a matter of course and regard gardening as a trifling business that is hardly worth the effort or consideration of a busy farmer. So many farmers claim that it does not pay them to plant a garden that I am inclined to accept their testimony as a fact, but there is something more than mere dollars to be considered. To paraphrase St. Paul's famous expression, one might well say, "Thou shalt eat a few fresh vegetables for the stomach's sake."

The most successful gardeners I have known are those who have the faculty of giving to all details that attention which is demanded. This would mean the thorough preparation of the soil, working up a fine seed bed and irrigating so as to thoroughly saturate the soil. This is usually accomplished by laying off the bed into rows, the distance apart depending upon the vegetables to be grown. Generally the water is run for several hours through the rows. When partially dried out the seed is planted just above the water line, the presumption being that there will be sufficient moisture in the ground to germinate the seed. If there is not and all the plants do not come up then a second irrigation becomes necessary, but the danger of a crust forming after irrigation before the plants break through makes this somewhat of a last measure procedure.

Beginning with January the things which may be planted are beets, carrots, collards, kohl rabi, lettuce, mustard, onion seed, onion sets, parsley, parsnips, peas, radishes, spinach Swiss chard and turnips. In February practically the same things and in addition potatoes, and toward the latter part of February sweet corn, or as is more commonly grown in Arizona, the Mexican June corn. This is strictly speaking a field corn, but makes excellent roasting ears. About three years ago I gave an ear of this corn to a friend who lives in Downey, not far from Los Angeles. He planted this, saved some seed, and for the past two years he and his neighbors have been raising it and selling it for roasting ears under the name of Arizona Sweet Corn. It has yielded well and the customers are highly pleased.

Of varieties that have been found best adapted to Southwest irrigated gardens might be mentioned the following: Beets, Early Egyptian, Crosby's Egyptian and Early Eclipse; carrots, Danver's Half-long and Early Chatenay; onion sets, Yellow Bottom, White Bottom; onion seed, Bermuda, Australian Brown and Prizetaker; lettuce, New York Market, Denver Market, California Butter. In a variety test of lettuce at the experiment station at Mesa a few years ago the New York Market showed such superiority over all other varieties as to leave no doubt of its value as a market lettuce; for family use there are some others that do very well. Only the early varieties of peas should be planted in the spring, such as American Wonder, Extra Early Alaskan, etc., spinach, Prickly Seeded Winter has been found to do well.

In the flower garden one may plant in January, cosmos, larkspur, petunias and sweet alyssum. Bulbs of the following may also be put out: Anemone, amaryllis, canna, calla lily, gladiolus, Spanish daffodils and jonquils.

Gardening in a Large Way

Cow peas being grown at the Arizona state hospital as a preparation for gardening

CALIFORNIA A WINTER GARDEN

From near San Francisco south to the Mexican line California in midwinter is a great vegetable garden. So strong is the Eastern demand for California vegetables in winter that every effort is put forth for a crop at that time, no matter what other uses the land may be put to through the remainder of the year. Nowhere is vegetable production more of a science and nowhere is the acreage increasing more rapidly year by year. One must know how to take advantage of the varying seasons in planting, tillage, irrigation and harvesting, and not only must he keep close watch on market and prices but frequently must anticipate the market or "figure ahead of the game."

The Pajaro Valley has shipped fewer apples to England than for several years.

The 1919-1920 Arizona Lettuce Crop

By E. W. Stillwell, Bureau of Crop Estimates

LETTUCE growing in Arizona is confined to three principal districts; first that comprising Phoenix, the Fairgrounds and Glendale; second, an area close to Mesa; third, a new section near Toltec. Climatic conditions and growing methods are about the same in the three districts. The contract system common in the Imperial Valley of California is followed for the most part, although some growers raise their crop for independent sale.

The growing of the crop in the Phoenix-Glendale district has been attended by a number of mishaps this season. The other sections have fared better. The following shows first, revised estimate of original acreage and, second, estimate of the acreage at the present time available for harvest: Glendale, 400, 150; Fairgrounds, 300, 125; Phoenix, 150, 25; Mesa, 150, 125; Toltec, 100, 100. Total 1,100, 525. This acreage compares with 150 acres for the state in 1919 and 125 in 1918.

A glance at these figures shows that over one-half of the original acreage planted this season has been abandoned. The abandonment was especially heavy at Phoenix, the Fairgrounds, and Glendale. In these districts the same deterrent factors operated. The first planting early in September failed to germinate properly because of hot weather and new seed which the growers were forced to use on account of a shortage of old seed. Most of the acreage thus affected was planted again although perhaps ten per cent was abandoned at this time. The second planting was hardly out of the ground before it was attacked and many fields entirely destroyed by caterpillars which migrated from adjacent corn and cotton fields. The only lettuce to entirely escape was that which was not near corn or cotton and comprised a very limited proportion of the whole planting. This second crop failure discouraged a large number of the growers and few replanted. The greatest part of the lettuce remaining is late.

The small decrease in the Mesa district was due mostly to poor germination of seed in the early plantings. The caterpillars did not appear there.

Lettuce has never been grown in the district near Toltec, therefore the results obtained are especially interesting. It perhaps will be noted that there has been no decrease from the original acreage planted. However, most of the present acerage was secured by a second planting. Irrigation is furnished by pumping water from wells. After bringing the first planting of lettuce safely through the ground the pumping plant broke down and the plants died from lack of water. This second planting was late but the stand is reported as almost perfect, and as there has been practically no damage from pests of any kind the crop is in excellent condition. An estimated yield of 200 Brawley crates per acre is expected. Carlot shipment probably will start February 15, continuing through March with the heaviest movement the latter part of that month. It is thought at this time that 60 cars averaging 330 crates each will be shipped from Toltec.

The present condition of the fields remaining in other sections is good, probably 85 per cent normal. Growing conditions have been favorable since the caterpillars were banished. The only visible damage to the crop is a yellowing of the outer leaves and tips of plants in some fields of early plantings which were hit by frost This damage is evident on not over five per cent of the crop and hurts the appearance rather than condition or carrying quality.

The effect of late planting upon the yield is not known and it is difficult to obtain an accurate estimate upon this point. The best authorities however seem to agree on about 200 Brawley crates per acre. Using this as a base the estimated commercial production for the Phoenix-Glendale and Mesa districts would be approximately 258 cars of 330 crates each. In figuring the actual carlots which will be shipped, however, it is necessary to take into consideration local factors which influence this item. The acreage at Toltec and Mesa will all, or practically all, move in carlots. That at Phoenix will be used largely for local consumption, the remainder going out in l. c. l. lots. The Glendale and Fairgrounds acreages will go out in carlots, in l. c. l. lots and some will be used for local consumption. Considering these facts it is believed that the carlot shipments probably will be about as follows: Glendale, 40 cars, Fairgounds 75 cars, Mesa 75 cars, balance l. c. l and local, 68 cars.

In previous years the so-called "2-3 crate" has been the popular package, but this year only one shipper will use it. The rest will use the Brawley crate. The 2-3 crate measures eight by 18 by 23½ inches. Lettuce is packed in two layers with ice between. The number of heads in a crate runs from 30 to 48, three packs being used, 30, 42, and 48, the former two being the most common. The Brawley crate is well known to the trade and measures 13 by 18 by 24½ inches. The contents usually are packed in four layers, the number of heads varying from three dozen to as high as nine or ten dozen in some instances. The popular and most common pack is from four to five dozen. These crates average 330 to the car while the 2-3 crate runs from 420 to 448 per car.

Carlot shipments probably will begin from Glendale, the Fairgrounds and Mesa the first week in January but will be light during that month. Perhaps 15 cars will move from the first two points combined and as many from Mesa. Forty to 50 cars are expected to move from Mesa in February, the remainder in March. The movement from Glendale and the Fairgrounds should be fairly uniform throughout February and March, probably heaviest about March 1st. The movement from Toltec has already been discussed.

Figures secured from the railroads by the bureau of weights show the total carlot movement of lettuce from Arizona in 1919 and 1918 as 40 and 64 cars, respectively. The relatively light shipments in 1919 were because of poor yields.

Raymond Ellis is the new assistant farm adviser in Tulare County.

GRASS FOR ALL

Much land in the southern third of California supports no native grasses, and the search for suitable species for the varied soils and climates has been both interesting and profitable. The federal government, the state, and enterprising seedsmen have all contributed their share, until now we have grasses or forage plants for all soils and situations. One man on the shores of the Salton Sea has 320 acres of Rhodes grass on soil so strongly alkaline no other crops will grow, land upon which not a single spear of grass ever grew before. Others are growing good grass crops on what heretofore has been dry desert sand or barren hillside.

TRACTOR AND IMPLEMENT PLAN FOR 1920

The California Tractor and Implement Association, with headquarters in San Francisco, has decided not to hold large public demonstrations during 1920. A fund of at least $12,000 is being raised, however, and smaller demonstrations and large still exhibits will be made at state and other fairs.

Hudson's Four Year Old Prophecy Fulfilled

The Super-Six Motor Patented, Controlled And Exclusive to Hudson Has Met Every Promise

"The superior type which all must concede" is a claim we made for the Hudson Super-Six nearly five years ago.

Today close to 80,000 Super-Six owners and scores of official records reveal the truth of that prophecy.

Hudson originated through the Super-Six a principle which added 72% to power and 80% to motor efficiency. It reduced vibration almost to nil and thereby increased motor life. The forces which in other types destroy are in the Super-Six directed to useful employment.

They account for Hudson becoming the greatest speed, hill-climbing and transcontinental car ever built. Its position is not questioned. Everyone knows it.

Hudson Alone Controls the Super-Six

There is little doubt that all would adopt its invention were it not for the patents which Hudson holds.

Think what it means to add 80% to efficiency without increase of weight or sacrifice of simplicity. That advantage was recognized by engineers as soon as the principle was revealed. Everyone admits the unrivaled position of Hudson. Who questions its superior ability in any performance that calls for power, flexibility and endurance?

Further development of the first Super-Six was inevitable. But nothing has called for a change in the principle which gives it exclusive advantage. Improvements have come through refinement and in raising other car units to the standard of its motor.

Each Year Has Seen a Greater Hudson

No one at first realized the Super-Six capable of withstanding such punishment as it has taken in the hardest tests ever imposed on a motor car.

The fastest 100 miles ever officially recorded of a stock car did not show Hudson's limit. So harder tests were imposed. The twenty-four hour run was one; and although a Super-Six stock chassis in that time traveled a distance greater than from New York to Denver, its endurance limit remained unknown. The trip across the continent from San Francisco to New York, in a seven-passenger touring car, was made in 13 hours less time than its nearest rival. And then, since that did not show its endurance limit, the car was turned about and completed a test never attempted by any automobile before or since. The round trip was made in 10 days, 21 hours.

So the Present Hudson Is Even Greater

Each successive Super-Six model has added to Hudson's leadership. Each Hudson has become even more dependable, and now it seems to be as nearly perfect as it is possible to make an automobile.

And Everyone Admits Hudson Leads in Style

Look about in any assemblage of fine automobiles and note the dominant distinction of Hudson. Even sellers of rival cars, unwilling to admit the mechanical superiority of the Super-Six, because in that particular they know none other can use its motor, openly say Hudson sets the style in body types.

The Super-Six motor made Hudson the largest selling fine car in the world. Buyers have always had to wait for delivery of favorite models. They are waiting today. You will surely want a Super-Six sometime within the next year. Now is not too early to order.

A Blow at High Cost of Living

Through the efforts of Georgia farmers a bean has been developed which fills the requirements of coffee. A new plant, brought recently from South America, its success has been demonstrated by enormous yields in Southeastern States. The government analysis shows it similar to coffee, but without any trace of caffeine, while coffee experts have pronounced it superior in taste and aroma.

Every man with a small plot of ground can grow, roast and grind this remarkable bean, thus securing a drink of unexcelled quality at an enormous saving.

A pound of seed should produce three hundred to four hundred pounds; sixteen pounds plants an acre, yielding five thousand to six thousand pounds. We are planting several thousand pounds for market purposes, but wish to buy your surplus yield, at a good market price.

The bean grows on a bush, maturing in a few months. After the harvest the stalk and leaves may be used as stock feed, as its analysis is practically identical to alfalfa. Its nitrogen contents make it invaluable for intercropping purposes. The plant requires no unusual method of cultivation.

This is California's latest industry. Help make it the greatest. We wish your cooperation.

CITRUS INSTITUTE

Declaring that the best authorities in the world on citrus fruit culture will be brought here for the citrus institute to be held in conjunction with the Tenth National Orange Show, Dr. H. J. Webber, director of the University of California citrus experiment station, has announced the conference of citrus fruit men for February 20 and 21. The Orange Show will be held February 13 to 23.

"The Institute program this year," said Dr. Webber, "will be an enlarged one. We will bring to San Bernardino some of the best authorities in the world on citrus fruit culture, men whose advice is invaluable to the grower. I am not ready to announce the program at this time and can do nothing more than assure the citrus fruit growers of California that it will be decidedly to their advantage to attend the institute, which after all, is the really practical side of the Orange Show."

The University of California citrus experiment station at Riverside will have a large and comprehensive exhibit at the Orange Show, said Dr. Webber. Last year the experiment station had on display 125 varieties of citrus fruit. This year there will be 300 varieties, and according to Dr. Webber the experiment station will within five years have completed a collection of between 500 to 600 varieties.

OAK ROOT FUNGUS HELD UP

The quarantine office at San Francisco has detected an infestation of oak fungus on apple trees received from a Portland, Oregon, nursery. "This pest,' writes the quarantine office, "is rather difficult to detect on nursery stock as ordinarily it has not progressed sufficiently to injure the roots of the trees. All one can detect is the black 'shoe strings' or rhizomorphs. If the roots are muddy their presence is almost certain to be overlooked as the fibrous tree roots and the rhizomorphs will appear almost identical. When the tree roots have been washed, the rhizomorphs are very easy to detect, as they are often almost coal black in color.

"The tree roots from this nursery were not washed as the trees happened to be apples, and in looking for aphis on the roots the fungus was discovered. If the stocks had been stone fruit, probably they would have been missed altogether. Each condemned tree was capable of starting an oak fungus spot in our orchards. To the best of our knowledge no method has ever been found which has proved successful in eradicating this fungus from the soil of an orchard after it has once become established.

"In our opinion this is one of the worst diseases the fruit grower has to contend with. It slowly but surely spreads through the soil, killing all stone fruit trees with which it comes in contact. The infested area continually gets larger until after a time a large area of land becomes absolutely valueless for fruit culture. The fungus seems to thrive particularly well in our best soils. The only trees which seem to survive it are the California black walnut, the pear and the fig. These are not very profitable in some localities, so the disease is capable of turning land valued at from $1,000 to $2,000 an acre into $300 an acre vegetable land.

"Washing of all tree roots would very largely prevent the introduction of this disease as it could be so much more easily detected. Borers, crown gall, hairy root, etc., would be much easier to discover and we would be very glad to see the time come when the washing of imported trees is made compulsory."

COTTON GROWERS TO ORGANIZE

An organization of cotton growers of the state is being urged by Director Hecke of the state agricultural department, for the general protection and promotion of the industry, including the inauguration of a system of regular inspection of the growing crops of cotton specifically planted as a source of seed supply, and the ultimate certification of cotton seed offered or sold. An organization meeting was held at Fresno, January 7.

Have you visited your local school this year? The teacher would like to have you do so. Better schools will result in any community if all take an interest in them.

WHY THE DIFFERENCE?

Orchard investigation by the Cultivator in three of the southern counties proves clearly that during the severe electrical windstorm about Thanksgiving Day the orange trees in some sections sustained severe damage. But in the same sections where orange trees lost much of their foliage lemon trees apparently lost none. In these few sections lemons are on one side of roads running in all directions and oranges just on the other side. Also orchards are planted to both lemons and oranges, the division running east and west as well as north and south. Also home groups of citrous trees were noted about dwellings. In every case the orange tree alone sustained injury. This was corroborated by L. B. Valla, traveling freight agent of the Southern Pacific Railroad, who has visited all citrous sections, and met a Cultivator investigator in the field. The Los Angeles County farm bureau has also noted these strange conditions and has asked the state college of agriculture if an expert cannot be detailed to fully investigate the matter in the hope of determining the cause of wind damage to orange foliage while that of the lemon is apparently immune. So far as noted no grape fruit trees were injured.

PROSCRIBED ORNAMENTALS SENT BACK TO FLORIDA

In checking up the reports of the state quarantine guardians received at the central quarantine station, Frederick Maskew reports a fine illustration of the diligence of the plant quarantine inspectors in the report of H. A. Spies of Ontario under date of December 5. In the brief, prosaic manner customary to the quarantine service, Mr. Spies reports the detection of a suspicious appearing parcel brought in as personal baggage by a passenger from Atlanta, Georgia. Upon examination the contents of this package were found to consist of 100 Cape Jessamine plants, from a white fly area, and brought into California in violation of the White Fly Quarantine No. 21. "Refused and returned to Ashford Park Nursery, Atlanta, Georgia" is the plain, straightforward statement of Mr. Spies.

EXPERIMENTS IN CONTROL OF MEALYBUGS

The Leffingwell Rancho Lemon Association, as the result of the success of the work of the office of pest control of the California department of agriculture in the control of mealy bugs by the biological method, has under consideration the erection of a insectary for the purpose of breeding beneficial insects. This insectary, it is planned, will be a community institution, to be supported by a number of citrus associations in the Whittier district. Superintendent Harry S. Smith was last week called in consultation with the officers of the Leffingwell Rancho Lemon Association and later with these officers and Messrs. Armitage and Harold Compere of this office visited the insectaries at Alhambra, Santa Paula, and on the Linonelra Ranch.

VACUUM FUMIGATION AT COACHELLA

Two vacuum fumigators designed and installed by Field Entomologist Mackie of the state department of agriculture, are now in full operation at Coachella. These fumigators are used to free dates of stored product pests. The work of these fumigators has been a complete success, the packing house manager being authority for the statement that not a single pest has been seen in the house this year. The date growers expressed complete satisfaction with the result of Mackie's work.

DIGGING MILLION DOLLARS WORTH OF NURSERY STOCK

Commissioner C. K. Turner of Placer County has advised Director Hecke under date of January 3, that nurserymen in Placer County are busy digging some 2,300,000 deciduous trees, a crop worth at current prices between $700,000 and $1,000,000. The only serious trouble with any of this stock is crown gall. Of this there is not as much as usual.

WHAT WASHES OUT OF SOIL?

When water percolates through earth, what does it carry out of the earth with it? That question, no doubt, was asked many thousands of years ago and has been repeated from time to time ever since, but it has never been completely answered. The answer, however, is being written bit by bit. The chemical and mineralogical nature of the materials extracted from soils by treatment with water has been under investigation by the bureau of soils. A number of minerals have been identified in these products and it has been shown that the evaporated water extract of soils leaves a residue showing considerable resemblance to the Stassfurt and other natural saline deposits. A material, provisionally called ultra clay, which consists of particles so fine they remain in practically permanent suspension, has also been obtained by these extractions and its properties are now under investigation. This ultra clay contains a much larger proportion of soluble salts than the soil from which it has been separated. A very significant attribute of ultra clay is its high absorptive power for potash. Soils containing a large proportion of ultra clay erode easily.

BULB INDUSTRY

The United States uses every year, in normal times, about $2,000,000 worth of bulbs and has produced hardly $25,000 worth of Dutch bulbs in any one year—this despite the fact that few plants are more widely adapted and few crops more easily grown than bulbs.

The reason for this situation, says the United States department of agriculture, is that it has always been thought that the bulbs could be bought cheaper than they could be grown. In the future, however, conditions are going to be different, and the department has published Bulletin No. 797, "Commercial Dutch-Bulb Culture in the United States." This 50 page discussion of the subject is available for limited distribution to interested persons.

Thus far, says the bulletin, commercial production of Dutch bulbs in this country has been confined to the Atlantic and Pacific seaboards, north of Norfolk and San Francisco, respectively. Good bulbs have been produced in both regions. The western area is confined to a rather narrow strip which receives suitable rainfall and is sufficiently affected by seacoast conditions to prevent rapid transition from winter to summer.

PROTECT YOUR TOOLS

Nearly every man owns at least a few tools such as chisels, hammers, augers, saws, wrenches, files, etc. These tools as a rule are infrequently used. They are often kept in places where they are exposed to moisture and consequently rust. Almost all tools, with the possible exception of hammers, are rendered less efficient by rust. When it is so easily prevented, it seems strange that steps are not taken to do it. It is well worth while to save the tools as every one knows that has had occasion to buy any new ones lately. Probably the best tool protector and carrying case for a small kit may be made in the shape of a roll from a piece of water proofed fabric.

A SQUARE DEAL NEEDED

Rural life is nowhere more attractive than in California. To the average adult of middle life it is almost entrancing. Yet the per cent of boys who leave the ranch at the first opportunity is nearly as great as leave the eastern farm. Rural attractions seem powerless to counteract or prevent this cityward trend. For good roads, automobiles, daily mail delivered at the door, telephones, electric light and power, even proximity to the city, fail to stem this ever-flowing tide.

The trouble, then, is not with the farm itself. Therefore it must lie with those who occupy it. Or must we admit the lure of the city to be stronger than the love of home and the farm? We believe that the fundamental cause for dissatisfaction is that the maturing boy, at least, does not get a square deal. It is an old and sad but true story that the farm boy is given a lamb, a calf or a colt for his "very own" and after it has grown to maturity it is sold by the father or turned into the general farm stock without the boy receiving any pecuniary benefit. Surely this is discouraging enough and sufficient to dull or crush the spirits, for a time, of any red-blooded boy.

But the boy finally becomes a man as able to cope with the problems of life as was his father at like age; perhaps better so. Doubtless he is as ambitious to start in business for himself as the average young man. What chance has he on the farm as compared to the city youth? The latter is a son, perhaps of John H. Smith, dealer in general merchandise. When he is 21 years of age the firm, if the boy prove worthy, becomes Smith & Son. But in the country it usually continues to be John H. Smith, proprietor of Meadowbrook Farm. The boy has no capital and sees no chance of starting in for himself. Too often he is less fortunate than the hired man, for the latter receives good wages and may therefrom, through strict economy, accumulate enough to make a modest beginning in farm operations of his own. Fathers, do you realize that your son has become a man, as much so in every way as yourself? Is your "boy" getting a square deal? If so, he will not leave a California farm that is able to support two men, but the fact must be recognized that both are men.—E. B.

According to W. C. Jacobson, superintendent of rodent control of the state department of agriculture, a large acreage of alfalfa and a great many fruit trees in some of the reclamation districts in northern Yolo County have suffered seriously from the depredations of pocket gophers. Grain lands have been literally honeycombed by the surface burrows of this pest, and since the grain has been removed and the stubble burned the gophers are making severe inroads into alfalfa fields and young orchards. On 300 acres of plum trees over 200 young trees could be readily lifted out of the ground, the tap roots having been cut off within a few inches of the surface. An alfalfa field which had a good stand for the past two years has been so invaded as to have only one-third of the crop secured before the invasion of this rodent pest. Methods and means of control are quite difficult because of the nature of the soil. However, arrangements have been made to flood a large area and drown as many as possible before proceeding with poisoning and trapping.

Ted—"I hope you gave your girl a Christmas present that will cause her to long remember you."

Ned—"I don't know about that; but it's a constant reminder to me, for I bought it on the installment plan."—Judge.

SPRAYING MATERIALS

The old saying that: "A stitch in time saves nine" is particularly applicable for the owners of fruit trees and vines.

There's another old saying you may apply in the same connection: "Better be sure than sorry."

Taken for granted that you realize the necessity for constant vigilance and the thorough application of spraying materials during this season of the year, the next question is what brand to use.

Orchard Brand spraying materials are made in California for Pacific Coast conditions. They are the result of many years' experience in orchard work by scientists, practical fruit growers, research, laboratory tests, and demonstrations which have proved their effectiveness.

There is a booklet full of carefully prepared information for fruit growers, which will be sent upon request. From it you may learn how to secure a profitable crop, and to preserve your trees or vines in healthy condition.

Write us for this booklet as soon as you have read this.

Also write for Bulletin No. 3 on Dormant Spraying of Deciduous Fruit Trees.

At this season these sprays are the best to use:

Orchard Brand Lime Sulphur Solution, Orchard Brand Bordeaux Mixture, Universal Brand Oil Sprays.

When you write for the booklet tell us the condition of your trees or vines. We will be glad to help you solve your problems.

The KILLEFER Way
is to Build Tractor Implements for Tractor Work

Killefer Quality — Killefer Efficiency

The term power farming as commonly applied means nothing, where the tractor only is given consideration, as is too often the case.

Successful tilage cannot be accomplished by the use of the tractor alone, no matter how efficient it may be.

Why overlook the fact that the implement behind the tractor is just as essential as the tractor itself but so frequently lost sight of by the purchaser.

To make your tractor a success use implements designed and constructed specially for the purpose.

The Killefer Manufacturing Company build only such implements. See this line on your dealer's floor.

(The above cut is only one of the many tractor implements which we make).

Catalogues and booklet on successful power farming on request.

The Killefer Manufacturing Co.

Plant Peaches

By A. Layman

IN 1914 when the peach growers were all in the hole, were not even getting the cost of production, and a "glut" prevailed, George Rooding said in an extended article written for the Cultivator:

"When four cents a pound is the ruling price for dried peaches, it is useless to deny the fact that the producer is in the hole. Everybody cries 'overproduction'. The packers start the music going and the echoes travel last to the great consuming public, reverberate and rebound until the poor grower, coming in with the refrain, actually believes he has engaged in a business which is absolutely hopeless.

"Let me ask you one question right here. Mr. Grower, do you think you are bettering your conditions when this state of affairs exists by going on year after year putting out an inferior product because you say it doesn't pay to make your fruit better? Right here I want to say that your reasoning is all wrong, for it is just such uninviting stuff which influences the consumer to say: 'Nay, nay, Pauline! this article does not appeal to me.'"

The remainder of the article from which the above is quoted filled a couple of pages and appealed for a more general planting of peaches of best varieties and producing highest quality of fruit. At that time it was commonly asserted that the business was overdone. "It's too common a fruit; it can be grown everywhere."

Today, in fact, for the past two years, the peach growers have come to the realization that the California peach, like the California navel orange, is grown to perfection nowhere else in the world. Still more, Eastern peach growing sections have suffered seriously from inroads of disease and from the fact that climatic conditions are not so well suited to peach growing as in this state. Of course, California success in peach growing has been increased, or rather, made possible, by cooperation. The peach growers were amongst the last, however, to realize the necessity of organization. They have succeeded wonderfully in perfecting an association which has handled the dried fruit production of the state. This association is now issuing a house organ, in the first issue of which is an article touching upon the necessity of planting a peach which will protect the Blue Ribbon brand. This article is written by George Feaver, Jr., president of the Fresno County farm bureau, in answer to the question, "What shall I plant?"

By George Feaver, Jr.

"What shall I plant?" is a question frequently asked. The person who undertakes to answer it wisely in the light of experience is taking grave risks. In view, however, of the fact that the planting of freestone peaches has been largely overlooked for several years past, it would seem that if you have suitable soil and would plant wisely for later years, you would do well to plant them now.

The drying peach is going to be very scarce in five years; it is already getting scarce. And at the same time prices are good, and I look for them to remain at 15 cents or better for several years.

Here in the Fowler district, most of the peach orchards are old, a large part of them so old that it is only a matter of a few years until practically all of them will be pulled out and replaced by vines or alfalfa. It is not customary to replace old trees immediately with new trees, owing to the possible presence of disease and the fact that a long series of crops have very likely more or less exhausted those elements in the soil which support the particular kind of tree pulled out. It is natural, therefore, for the farmer to plant vines, perhaps first planting alfalfa, sometimes planting the vines before the trees themselves are uprooted. It is not likely that the orchard acreage will be increased soon in this district. The same is true in most older districts. But observation proves that a large proportion of the trees coming into bearing in the next five years will be cling peaches for canning purpo If we expect the future to be tal care of, we have got to begin now.

Good Orchard Soil

Perhaps in planting peaches in future we will choose the soil a lit more wisely than in the past, tak care to avoid too sandy as well as heavy soils, alkali, and too much ha pan. Light, deep, rich, sandy loa well drained, are found ideal for peach. Peach trees will, howev grow well on some heavier soils.

While both Muscats and Thomps Seedless raisins are selling at go prices, it is hard to turn them do for the peach. The seedless com into bearing quicker and is a gene favorite. It is certainly far from purpose to discourage the culture the grape when I say that experien has often shown that the time to pla one fruit is when everybody else rushing into another. It so happe at this time that many old orchar which suffered from neglect in t financially disastrous days before t organization of the California Pea Growers are very far gone and may look for heavy losses of trees the next few years. The drouth th year killed thousands more, especial where water failed. The pendulum popularity which swings so often planting is sure to swing back aga to the peach. But what are we goi to do to fill our orders for the fin peaches in the world, say five or s years from now, if nobody plan peaches?

Kinds to Plant

The Muir, which is the best pea for drying, should be planted no The Lovell, a good drying peach, a more of an all-around fruit, al should be planted. However, it h one fault, that of carrying drying ov sometimes into the grape harvest. does not peel as well as the Muir. B it is a good peach. The Elberta, wh not sold for fresh fruit, bears a f tonnage for drying. I would not a vocate planting all drying peaches, all one variety, but rather I would lik to see general diversification in tr fruits, grapes, and alfalfa and oth products.

As the country settles up, the lab problem will be easier for the pea growers. By looking ahead a f weeks the peach grower can get h

Want Better Drying Sheds

I would like to make a suggesti for the handling of drying peaches understand that the cost of producin harvesting, and curing a ton of dri peaches this year amounted in so cases to $90 to $100 per ton. One re son, it appears to me, is the antiqua ed methods prevailing in the dryi sheds. The work is made too unhand Men are used to unload the truck place the boxes of fruit for the c ters and remove the trays. A litt mechanical ingenuity ought to provi a method of bringing in the trucks fruit, slipping the boxes to the cutt alongside and replacing them witho much handling. A mechanical a rangement for stacking the trays, low ering them a couple of inches, an finally placing the stack automaticall on the cars below for the men to mo to the sulphur house and the dryi yard ought to be devised. Such equi ment would release some of the to pick the fruit.

THE JUJUBE

By Forest E. Grow

The Zizyphus jujuba, or jujube, been grown by the Chinese for h dreds of years. Many varieties h naturally originated, and large chards of 100 acres in extent h been planted to the better sorts.

The seedling trees, like most ot fruit trees, are unreliable, but sin the better grafted varieties have b secured and planted, their real meri and value are just beginning to realized. The grafted trees comme bearing tho second year after pla ing, and often bear a small crop t first year. The trees are regula heavy bearers and have a decided or amental value.

The fruits ripen from September to November 15. Some varieties

good only when fresh, others may be dried like prunes or raisins, and keep in this condition for several years, and a few varieties will keep for an indefinite period. The dried fruit becomes sweeter with age.

When the fruit is desired to be eaten fresh from the tree, it should be picked when it shows a reddish brown or mahogany color, for at this stage it has a pleasant sub-acid flavor.

If the fruit is to be dried and stored away for winter use, it should be left on the tree until it is thoroughly colored and about ready to drop. A short exposure to the sun; usually about a week, under cheese cloth or a similar cloth covering for partial shade will prepare the fruits in condition for storing away in sacks. Laundered corn meal or flour sacks are very satisfactory.

It is generally conceded by those who have had the pleasure of testing the fruit that when the larger, finer flavored fruits can be produced in sufficient quantities and processed on a commercial basis that the product when properly introduced, would be a very popular seller in the confectionery and high class grocery stores. All who have sampled the processed fruits speak of the delicious flavor and texture, and I have yet to find one who dislikes the flavor of the jujube.

(Ways of using jujubes next week by Mr. Grow in household department. These are original, tested recipes.)

BETTER FARMING

The Los Angeles County farm bureau held an important and well attended meeting in Los Angeles December 20, the theme being "Better Farming." Addresses were made by J. B. Vaile, Prof. B. H. Crocheron and Elwood Mead, Carlyle Thorpe, Volney H. Craig and Dean T. F. Hunt. From Dean Hunt's address we quote:

"There have been two ideas underlying the development of agriculture in this and other countries. One is that cheap food and the rising prices of real estate help to build up cities. The idea is based partly upon the population increment. The greater the population the more profitable monopolized business becomes. It is based also upon another idea, so well expressed by President Wheeler: 'No American will have anything to do with anything that is not growing.' The most significant factor in the life of an individual or a city or a country is progress.

"The first question to consider, therefore, when one proceeds to discuss better farming, is whether your motive is to build a better rural civilization in the county or to increase the fame and wealth of the county seat, or both. George E. Roberts, the ex-treasurer of the United States, and now member of the National City Bank of New York, was not far from the truth when he said recently: 'A large decline in important farm products has occurred in the last two months, but the town wage earners are still engaged in trying to push their wages higher. In the long run equity must rule * * *. The essential truth to be absorbed is that the situation is not one of a struggle between capital and labor, but between groups of producers.' Doubtless, this is not quite the whole truth, but it is near enough to it to be mighty significant.

"I come now to the second idea underlying the development of agriculture. It is to create those conditions in the open country which will make it possible for those who actually do the work on the land to make successful homes. No one should be permitted the monopoly that ownership in land implies unless he intends to raise and educate a family from the proceeds thereof. The idea that people who live on the land shall be upstanding, God fearing, intelligent, well educated people is not based on altruism; it is due to the fact that the grandchildren of the people who now occupy the land will occupy the cities. This idea of a successful family life, this idea that the home and not the individual is the essential unit, which seems to have become a bit old fashioned, has a wider sweep than the farm home.

"For the 60 years ending 1910 about 1,500 farm families had been added to California annually. The number added yearly has not varied materially throughout this period, except during the Civil War when the numbers were of course greatly reduced. This addition is not important, therefore, from the standpoint of numbers. Its importance lies in the recognition that an unsuccessful farmer is not an asset to the state; that the fertile land of the United States must be reserved for those who wish to rear and educate children as well as to raise food and clothing materials; and that it is in the interests of the people of the cities, as well as those of the country, that the conditions of ownership and development shall be such as to cause intelligent, capable Americans to seek homes in the open country. If we are compelled to admit that food and clothing can be produced only under conditions requiring a submerged foreign laboring class, then we must make the further admission that democracy will fail and Americanization is a will o' the wisp. The primary purpose for better farming is not necessarily cheap food, however important that may be, but the primary purpose is a virile educated citizenship."

IS BORAX IN POTASH FERTILIZERS INJURIOUS?

Numerous cases where farmers who use much fertilizer injured their crops by applying potash either alone or in mixed fertilizers were reported last year. This was due to the fact that much American potash contains borax in sufficient quantity to be harmful where large amounts of fertilizer are applied. This condition has caused the department of agriculture to issue an order that all fertilizers containing more than one-tenth of one per cent show on the bag or other package just how much borax is contained. This has a tendency to make fertilizer users afraid of American potash. For ordinary conditions, however, this fear should not prevent most farmers who want some potash from using the American variety. This is due to the fact that farmers generally do not make large applications of fertilizer. They seldom apply more than 300 pounds to the acre and these or smaller amounts will not carry borax enough to do any harm.

It has been found that to do harm to crops ten pounds of borax per acre is required when applied with the wheat drill or broadcasted. This would require 1,000 pounds per acre of a fertilizer containing as much as one per cent of borax, and one per cent is very unusual. Where fertilizer is drilled in the row with a corn planter attachment there is a little more danger from borax, since it only takes two pounds of borax per acre to be harmful in that case. This would require 200 pounds of fertilizer containing one per cent borax, and it is unsafe to apply more than 100 pounds of any fertilizer in the corn row for the reason that heavy applications in the corn row do no good when hot, dry weather comes on. Harm may even result from firing or other causes. Farmers need have little fear of American potash.

A Machine that Solves Your Drainage Problem

The Austin Farm Ditcher, Terracer and Road Grader does many things and does them well.

It is unequalled for digging drainage ditches. It will dig a V-shaped ditch 4 feet deep, whose sides slope at an angle of 45 degrees. A ditch of this shape will not cave in or wash out. The Austin Ditcher will grade a road and keep it in repair. It will terrace hillsides so as to prevent soil washing and to make slopes hold moisture. Send for free literature.

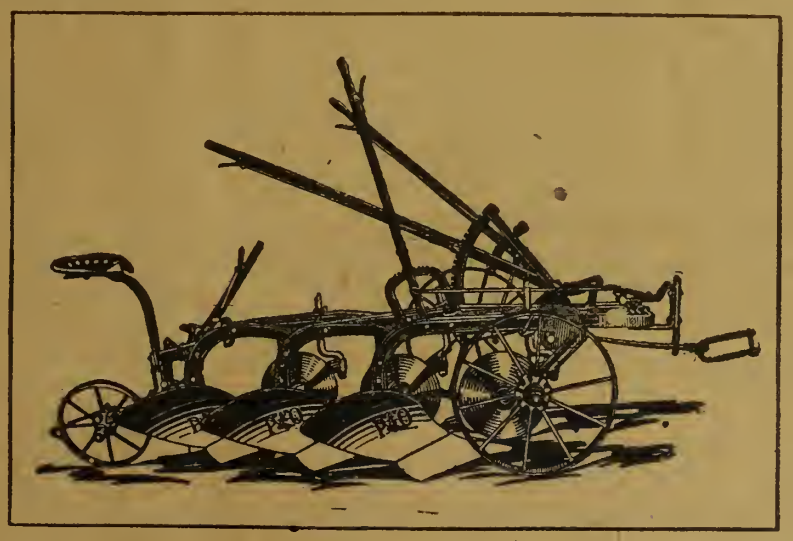
Light-Draft Plows

EVERY detail in the construction of the P&O Line of Light-Draft Plows is worked out on the lines laid down by the founders—making for Simplicity and Strength. The popularity of these famous plows shows that the policy of the founders was right—they "knew how."

Used by Three Generations of American Farmers



78 Years of "Knowing How" Hammered into Every One of Them

P&O Light-Draft Plows cover a wide range of work, not only for all ordinary plowing, but for the unusual and the extraordinary. *For Horses:* Walking, Sulky and Gang, both moldboard and disk, in all standard sizes and models of bottoms. *For Tractors:* From 2 to 6 bottoms, both moldboard and disk. *Special:* For grading, ditching, hillsides, root ground, cut-over timber land, orchards, etc. There is a P&O plow for any section, and for any condition of soil.

Whether you own or operate a horse-plow farm or a tractor-plow farm, get a P&O Light-Draft Plow, and be a satisfied plowman.

Write for P&O Plow Catalog, or call on the nearest International dealer. Tell us your plowing problems—we believe we can help you.

WHERE COFFEE GOES

While we import all our coffee we export a large quantity. We get some from the West Indies and send some back. The bulk of our coffee comes from Brazil, but Central America, Mexico, the West Indies, and Hawaii and Porto Rico supply what are known as mild coffees; from Aden and Arabia comes the familiar Mocha; and the Dutch East Indies send Java coffee. We send these coffees to many countries, but Cuba is our best customer, to which country we sent 15,595,000 pounds in 1919, and 11,699,000 to Spain. Other customers in the order of their importance are: France, Belgium and the Philippine Islands. While we export coffee to Central America, Mexico, and the West Indies, it is not the varieties we receive from there, but Mocha and Java. But that we send to Cuba comes from Porto Rico.

SWEET CORN FOR BREAKFAST IN ENGLAND

A Tennesseee newspaper says: A novelty to Americans in London fruit store windows has been the display of sweet corn. The ears are exhibited in state along side hothouse peaches and grapes. The corn sells for 25 cents each (an ear), the peaches $2.25 each, and the grapes at $1.25 a pound.

An American who went into one of the fruit shops to make inquiries about the sweet corn was informed that it was grown in England with special care.

The impression prevails that it is the American custom to eat sweet corn for breakfast. Most of the English people who can afford sweet corn therefore have it prepared for the morning meal. It is boiled until the whole ear is tender, then it is sliced and the entire cob is eaten.

MORE AND BETTER ROADS

Of national interest to truck owners is a series of conferences which representatives of the National Grange are holding with Senator Townsend of Michigan relative to his bill in congress providing for the building and maintenance of a national highway system by the government under a federal commission.

M. L. Pulcher, vice president and general manager of the Federal Motor Truck Company, Detroit, Michigan, points out that the action of the National Grange, which comprises 700,000 farmers, in endorsing a national highway system at their annual convention in Grand Rapids recently is the most significant step yet taken to obtain legislation for the problem which the tremendous expansion and use of the highways by motor vehicles has brought to the front as a real necessity.

"The motor industry has played no small part in the development of the roads of the country," he said. "They have helped in the expansion of the network of roads which bind the towns and the villages, the cities and the farm hamlets.

"A national highway system will give a tremendous impetus to intercity haulage. The great highways of commerce will be strengthened and made more durable. The truck will become in reality the "little brother" of the railroad.

"If a great body of farm folk of this country believe that a national highway system will be beneficial to them, how much more beneficial will it not be to the manufacturers, part of whose transportation problem is vitally tied up in the motor truck.

"The farmers with great vision for the future and their own needs have gone on record in favor of a national highway system. When will the business men and manufacturers go on record?"

HOME CONSUMPTION OF COTTON

American cotton mills consumed 491,313 bales of cotton during September, a slight increase over that used in September, 1918. The 1919 figures include 23,552 bales of foreign and 2,458 bales of Sea Island cotton. On September 30, there was 1,074,457 bales in consuming establishments and 2,492,220 bales in public storage and compresses. During September 54,176 bales of foreign cotton was imported as against 313 bales only in September, 1918.

Own a "Selected" Farm in Western Canada

Make Bigger Profits!

THE most wonderful opportunity in the world for Business Farmers is in the "SELECTED" FARMS which can be bought for $15 to $40 an acre along the lines of the Canadian National Railways in Western Canada.

"Selected" Farms

These "SELECTED" Farms are carefully chosen from the cream of the richest wheat and cattle country in America, to meet your special needs, on the advice of experts representing 14,000 miles of railway, whose assistance, though free to home seekers, is of great practical value.

A Cordial Welcome

Western Canada extends a helpful hand to home seekers. Friendly neighbors, with the same customs and language—splendid schools, churches and social life—every benefit that you formerly enjoyed and many advantages that you could not get from higher priced land elsewhere—warm, sunny, growing summers and dry, cold, healthy winters—await you in this wonderfully prosperous "LAST WEST."

Taxes Are Low

Western Canada taxes fall lightly on the farmer. A small tax on land, but buildings, improvements, animals, machinery and personal property are all tax exempt.

Big Profits in Wheat and Dairying

Western Canada is famous for its big wheat yields. "SELECTED" FARMS along the lines of the Canadian National Railways average more than 20 bushels of wheat to the acre. Under specially favorable conditions a yield of 50 to 60 bushels per acre is not uncommon.

Dairying is exceptionally profitable. That soil and climate are well adapted to it is shown in greatly increased production and high quality maintained. A world-wide market awaits all that Western Canada can produce.

Fortunes from Beef and Dairy Cattle

Western Canada, the Cattle Man's Paradise! Beef and dairy cattle yield great profits. Stock thrive on the prairie grasses, which in many cases cure standing and make fine hay. Cattle and horses require only natural shelter most of the weather, and bring high prices without grain feeding.

Easy Terms

Terms on "SELECTED" Farms: About 10 per cent cash down, balance in equal payments over a term of years; interest *usually* 6 per cent.

Special Rates to Home Seekers

Special railway rates will be made for home seekers and their effects to encourage personal inspection of the Farms along the lines of the Canadian National Railways. Rates and full information will be sent free on request. *Write or mail coupon TODAY!*

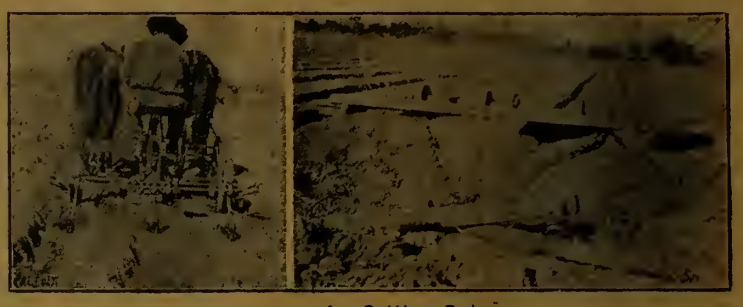
PACIFIC PIPE CO. 23 HOWARD STREET SAN FRANCISCO

Onions and Spinach in Coachella

By Ernest Braunton

NEVER was the outlook for the truck grower better in the Coachella Valley than at present. This is the message brought back by R. G. Risser, manager of the crop production department of the California Vegetable Union.

The onion acreage in this valley is 2,700, just planted, about three times the usual or past area, though doubtless it will not be reduced in years to come. The crop centers largely about Thermal, for that is the home of the heaviest grower, Geo. M. Beach, who is also president of the Thermal Growers Association. Mr. Beach has 120 acres of onions. The extended acreage is largely due to the high prices of 1919, prices which will doubtless hold firm for the coming crop, not far away, for the shipping begins in April, the bulk of the crop going out in May. During the past year the entire crop was shipped through the California Vegetable Union which paid the growers $3.15 net for 50 pound crates. This was above six cents a pound and as the yield was about 300 crates to the acre the grower received nearly $1,000 for each onion acre.



Preparing for Setting Onions

Picture at left shows the first operation after plowing by the two horse furrower. Picture at right shows smoother and marker.

The onion growing in the Coachella is almost entirely in the hands of Americans, there being a few Mexicans and still fewer Japanese. The varieties grown are Yellow Bermuda and Crystal Wax, principally the first named. Nearly all the seed used is grown at home; Mr. Beach has for several years raised his own. Those who buy get the Teneriffe-seed from the Canary Islands. Mr. Risser saw a five acre seed bed on the Beach ranch which contained sufficient young onions to plant 150 acres. The biggest competitor is Southern Texas where the acreage ranges from 8,000 to 18,000 and the crop is a little earlier than in California. There is also grown from 300 to 500 acres in the Imperial Valley where conditions are also very favorable for onions.

Standardization Law

This year will see the first enforcement of the new standardization law though the Vegetable Union has for years encouraged grading and the output will not be much changed because of present legal restrictions. The law will eliminate three classes, split onions, seed stock onions, and those of wrong color. The latter are of the best, of course, but each must go where it belongs. So the white onions will be looked over and the yellows and reds placed in their own color class. The split onions are due to a check in growth, perhaps a lack of water, followed by a new start, often the result of an irrigation too long delayed.

As the soil is light and easily worked it is trenched deeply with a cultivator making three furrows. Over this is run a smoother made of planks under which disks run that mark the lines and make tiny trenches for the little plants. They are planted in double rows about 13 or 14 inches apart and double that space between the double rows. The young onions are pulled out of the seed bed, cut down to two or three inches high and put in crates for hauling to field. This work is usually done by contract, the labor being largely Mexican. The price this year is $30 an acre as against $20 an acre last year. As soon as planted the crop is irrigated in the furrows made by the previous cultivation. The first cultivation of the young onions is by hand pushed wheel hoes, a row at a time, but later it is done on a wider plan and the patient burro is much used to plod across the field with a cultivator attachment. The onion's most serious enemy is the thrips and its best friend nitrate of soda.

The Succulent Spinach

The spinach crop is now being shipped, the most perishable of all crops shipped out of the state. It was once thought it could not be sent to Eastern markets and it is only three years ago that it was first shipped in carload lots, so it is one of our newer industries. But the perfectly packed and refrigerated crop now reaches the

A California Spinach Ranch

The upper portion of the picture depicts a spinach harvester or cutter turned on its edge to show the method of placing the knives which do the cutting.

Atlantic seaboard in 14 days. One grower in the Coachella Valley has an immense crop, running to 400 crates an acre, for which he is asking $3 a crate. If he gets his price the return of $1,200 an acre certainly should satisfy, but he is anxious to harvest the crop at once so he may immediately replant the land to onions. This is a phenomenal yield, for many fields run but 100 crates to the acre. The varieties grown are principally Broad-leaved Prickly and Bloomsdale Savoy, with the former dominant. Other growing centers are around Austin, Texas, and Norfolk, Virginia.

CROPS' VALUE ALMOST TRIPLED

The value of crops produced in the United States this year is nearly three times greater than the average annual value during the five years preceding the outbreak of the European war, according to the report of the secretary of agriculture. "On the basis of prices that have recently prevailed," says the secretary, "the total value of all crops produced in 1919 is $15,873,000,000, compared with $14,222,000,000 for 1918; $13,479,000,000 for 1917; $9,054,000,000 for 1916; $6,112,000,000 for 1914; and $5,829,000,000 for the five year average, 1910-1914. These values represent gross production and not net returns to the producer. The value of livestock on farms in 1919 was $8,830,000,000, compared with $8,284,000,000 in 1918; $6,736,000,000 in 1917; $6,021,000,000 in 1916; $5,890,000,000 in 1914; and $5,318,000,000 for the five year average, 1910-1914.

"This increased financial showing, it is again necessary to emphasize, does not mean that the nation is better off to that extent or that its real wealth has advanced in that proportion. Considering merely the domestic relations, the true state is indicated rather in terms of real commodities. The increased values, however, do reveal that the monetary returns to the farmers have increased proportionately with those of other groups of producers in the nation, and that their purchasing power has kept pace in the rising scale of prices."

POTATO SEED FOR SUBTROPICAL USE

It has been the experience of potato growers in practically all warm countries, such as Cuba, Bermuda, Florida, Louisiana and Texas, that it is impractical to try to produce their own seed potato stocks for more than one or two years, and in fact most early producing localities import their seed every year. The natural potato climate is one where the season is cool and usually short, and it is in such localities that the plants are little troubled with disease. They grow rapidly and the tubers from such plants make strong, vigorous seed which produce a new crop ten days or two weeks earlier than seed grown in a warm climate. Potatoes grown in a subtropical climate soon lose their vigor and become very susceptible to disease and "run out" to such an extent that it becomes necessary to replenish seed stocks from localities where the potato naturally thrives. Seed potatoes brought directly from cold climates to warm ones often do not give quite as large yields the first season as "acclimated" seed—that is seed grown for one year in the new locality. It is therefore possible to improve southern seed by selection of most vigorous plants and in this way carry over the homegrown seed one or two years.

THE FLANDERS POPPY

Some alarm may have been occasioned by reports that over there "in Flanders fields where poppies blow" lurks danger for agricultural America. The field poppy of Europe (Papaver Rhoeas) is the same old red poppy we have always grown in our gardens and from which the Shirley poppy is a sport. Though grown in the United States for centuries, no complaint of it has reached our ears. In California an occasional stray plant of it has been seen in damp sandy spots, as is the case with many other escapes, but not enough of it will ever grow wild flowers.

The manager of the Sutter Basin Company has been investigating irrigation systems of the southern part of the state and planning for irrigation extension in the Sutter district.

For Any Pumping System

BOSCH
HIGH TENSION MAGNETO

Power that is instantaneously ready—Power that is absolute in its dependability—Power that is enduring in its economy—is assured by the use of Bosch High Tension Magneto Ignition on a properly designed gas engine.

When Fairbanks-Morse Engineers conducted their extensive ignition investigation of 1919, they tried all ignition systems as compared with the world-famous Bosch Magneto. They exposed the Bosch High Tension Magneto to all kinds of weather—gave it far more severe tests than it could ever get under the hardest farm conditions, and then they had to agree that their newest and best engine, the famous "Z," should be Bosch magneto equipt.

The searching strain of farm work necessitates nothing less than Bosch High Tension Magneto Ignition—it is always efficient and dependable. For any piece of engine-driven farm machinery, insist on Bosch High Tension Magneto—America's Supreme Ignition System—you can get it.

Dayton Airless

PIERS of LIVE RUBBER take the place of a TUBE
This Tells the Story
I have used a set of Dayton Airless Tires, getting 44,000 miles out of the front and 20,000 miles out of the rear tires, the difference in mileage being due to my overloading my Ford Touring Car by hauling three barrels of oil constantly.
I used the tires constantly, nearly three years, and Dayton Airless Tires make no difference in the wear and tear of a car. I find the engine and steering apparatus as good or better than the average car of like age.
And the satisfaction of knowing that when a person starts he can get somewhere without distress of both body and mind by punctures, blowouts, and loss of time is a compensation in this age of progress for any difference in price. The fact is, in the long run, the cost of Dayton Airless is about half the pneumatic cost.
HAROLD T. SMITH, Asst. Treas.
HUMBLE & GULF COAST OIL COMPANY

Punctures Proof AND Easy Riding

Put Dayton Airless Tires on your car now and forget punctures, blowouts, pumps and patches. Seven years of service has proven their success and reliability. Over 100,000 are in use today. They don't bounce like a tight pneumatic nor d-r-a-g like a loose pneumatic. They are easy riding—and wear till there's nothing left but shreds.

GRAIN

Wheat: The prices are based upon federal grades and standards at the terminals in San Francisco Bay and Los Angeles, and are as follows, per bushel of 60 pounds:

	Per Bushel	Per Cental
Hard White—		
No. 1	$2.20	$3.66 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.13	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51⅓
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.09	3.48⅓

The above are minimum prices.

For sacked grain add 4½ cents per bushel of 60 pounds to above prices. Deductions of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.00@3.05; black, 3.00 3.20@3.30.

Corn: California yellow, 3.10@3.20 per cental; Egyptian, 3.65@3.75; milo maize

Rye: 3.35@3.45.

Barley: Spot feed, per cental, 3.50@ 3.60; brewing, 3.65@3.75.

HAY

Under date of January 10, Scott-Magner & Miller says:

Receipts past week 1,600 tons. Although demand in San Francisco is light there has been good country demand. Owing to cold, frosty weather and north winds grass has been very backward necessitating the feeding of hay throughout the country districts. The warm weather of last week gave every indication of some early grass for feeding but the cold weather of the past week changed very materially all these conditions. The market has been firm and at times prices in excess of our top quotations have been establishcd. Considerable alfalfa hay has been moved from Nevada to this state and promises to continue for some time.

We quote today wholesale prices in carload lots as appear from dealers transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses are to be added according to conditions:

Fancy Wheat Hay (light 5 wire bales)	26.00@28.00
No 1 Wheat or Wheat and Oat Hay	23.00@27.00
No. 2 Wheat or Wheat and and Oat Hay	22.00@24.00
Cholce Tame Oat Hay	25.00@28.00
Other Tame Oat Hay	22.00@25.00
Wild Oat Hay	21.00@24.00
Barley Hay	21.00@24.00
Alfalfa Hay	23.00@28.00
Stock Hay	18.00@21.00
No. 1 Barley Straw, bale	.50@ .9

Citrus Markets

Los Angeles, January 14, 1920

Valencias are recovering from the slump of last week though the recovery is exceedingly slow. Some very low sales are being made for some indifferent stuff. However, in auctions occasional toppers touch the $6.00 mark. At Atlantic seaboard ports lemons are running very low in price. Vast quantities of foreigns are being received. In Middlewest fair prices prevail.

Shipments

Shipment of oranges from Southern California to date since November 1, 1919: Oranges, 4,213 cars; lemons, 6 total, 4,898. To same date last season Oranges, 2,700; lemons, 1,272; total, 3,97 Central California: Oranges, 3,343; lemons, 133, total, 3,476. To same date last season; Oranges, 2,143; lemons, 154; total 2,297. Northern California: Oranges, 2 lemons, 20; total, 280. To same date last season: Oranges, 229.

REVIEW OF TRUCK CROP CONDITIONS

By E. W. Stillwell, Bureau of Crop Estimates

Asparagus (Imperial Valley): Estimated acreage 300, or about same as last year. Shipments expected to start about March 1, with estimated total carlot movement 40 to 45 cars.

Cabbage (Los Angeles and Orange Counties): Rains did not aid very much in eliminating aphis and growers in some sections spraying as precautionary measure, although little damage yet. Demand good and shipments increasing. Orange County acreage late, and shipments almost all from Los Angeles County. Planting fully as heavy as originally estimated, with probable slight increase both counties.

Cauliflower (Los Angeles County): Shipments heavy although cold weather retarded development and heavy winds slowed up loading. Quality of stock variable but tending to improve. Movement after February 1 will be lighter.

Celery (Los Angeles County): Considerable winter blight not previously noticed showed up in fields harvested the past week. This necessitates heavy trimming, and, consequently, smaller sizes. Damage difficult to estimate until crop is actually harvested, and not all fields affected, but believe will cut down total yield 15 per cent. Demand for large size stock keen, and price to growers running generally 90 cents for No. 1's, with top price of $1.00 reported. Growers with large percentage of small sizes finding difficulty to market crop. Crop would be benefited greatly by rain.

Lettuce (Los Angeles County). Shipments continue light, largely mixed cars. Quality only fair. Growers planting heavily for April and May shipment. Acreage appears now about 3,000. Buyers paying as high as $1.25 per field crate for best stock.

Lettuce (Imperial Valley: Rain January 3 tended to open mature heads and stopped shipping temporarily, but generally beneficial. Shipments expected to increase with movement next ten days, averaging 10 cars per day, and heavier the last week of this month. Quality of stock being shipped reported excellent. Weather entire season remarkably favorable. Sales carloads f. o. b. usual terms and cash track around $2.75 per crate, netting growers around $1.50 delivered to shed. Arizona: report from field agent states first car out December 24, second car probably past week, but January shipments light. Peak of movement February. Growing conditions past month exceptionally favorable. Previous estimates of yield and shipments stand.

Peas (San Diego County): Carlot shipments now moving from Carl about five per week. Recent unreasonably hot weather has not been best for development of crop, but it is not believed that yield is affected. Quality reported excellent.

Tomatoes (Mexico): Crop reported as developing normally, although not believed over 1200 cars will be shipped. First car has moved. Shipments expected to continue through May, with peak in March.

Spinach (Imperial Valley): Recent rains thought beneficial to crop. Damage by fungus does not appear to be increasing. Shipments steady—about five cars per day.

MARKET NOTES

Crop Investigator Stillwell of the local United States bureau of markets has just returned from the Imperial and Coachella Valleys, after a thorough canvass of that field. He reports the lettuce crop as 9,500 acres, the 1918 area being 2,650 acres. Spinach covers 1,200 acres, though last year but 75-100 acres. Peas total 865 acres as compared to 300 in 1918. Cabbages run about 295 acres. In the Coachella Valley there are 2,700 acres of onions and 145 acres of spinach.

The outstanding feature of the week has been the advance in cabbages, now selling at $70 to $75 per ton in carload lots, some growers claiming sales at $80. Ten cars daily are going forward, with some cabbages in the 30 cars each day of mixed vegetables. Cabbages are everywhere scarce.

Sweet potatoes are up and if quality was good would bring $5, but they are of poor keeping quality and many spoil in transit. Celery is going forward from both north and south fields and spinach and lettuce shipments from the Imperial Valley are heavy and increasing daily.

Northern Burbank potatoes are coming to Los Angeles market and bringing $5 to $5.25 in car lots; Idaho Russets bring $5. For the first time in several years potatoes are coming from as far east as Minnesota. The first car of Mexican potatoes came in during the week and sold readily at $3.50 to $4.00. These high prices are due to a general crop shortage in the United States of 15 per cent, the northern Maine crop alone being 40,000,000 bushels less than in 1918. French endive is new on the market and peppers and egg plant are coming from Florida, the local grown supply being exhausted.

BOUNDS FOR JAPANESE BEETLE

The Japanese beetle immigrated to the United States in 1911 in the grub stage on the soil surrounding iris plants. Finding residence in Burlington County, New Jersey, this colony of Japanese beetles prospered, multiplied and increased in compound measure to the extent that soon the horde of pests became so obnoxious that the state department of agriculture, in cooperation with the United States department of agriculture, had to exercise the ingenuity of science to hold them in check.

The Japenese beetle is a general feeder which attacks fruit trees, grapevines and many varieties of vegetables, a large number of ornamental plants, and a host of weeds, while it especially likes sweet corn. The beetle is a strong flyer during the warm periods of the day, and it is liable to be distributed on the clothing of autoists, pedestrians or others who travel through infested territories. It is likely to be shipped out on various farm crops, especially on sweet corn, as the beetles penetrate the ears of corn. In order as far as possible to limit distribution by such means a federal quarantine is now in effect providing for the inspection and certification of all green sweet corn used commercially in infested portions of Burlington County. Control measures which spell sure doom to the Japanese beetle consist of establishing a belt of poisoned foliage around the infested area. Destruction is also effected by means of poison sprays used copiously on green growth subject to attack, as well as by treating the soil with sodium cyanide in solution. Roadways are being cleaned of food plants which are attractive to the pests, in order to prevent dissemination of the infestation through the agency of passers by.

AMERICAN TRADE WITH INDIA

A trade commissioner writing on this subject says that American prices are too high and we must remember that of the 350,000,000 inhabitants, 300,000,000 have no purchasing power. Wages over the whole country do not average more than 25 cents a day and when the cost of living is taken out of this, not much remains. The prices of goods sent to India must, therefore, be within the reach of the people.

IMPORTS FROM MEXICO

It may not seem strange that our largest importation from Aguascalientes, Mexico, in 1918 was bones, of which we received 772,000 pounds, and of hides 130,918 pounds. So much for bulk, but in value we received $11,276,613 worth of copper bullion and $1,112,936 worth of lead bullion. Hides came third in value and next came goat skins.

AFRICAN ORANGES

Sir Percy Fitzpatrick, a leading orange grower residing at Clonave, South Africa, is visiting the orange growing sections of California. Author, politician and globe trotter, he has a thorough knowledge of the principal citrus sections of the world. About 100,000 acres of oranges are coming into bearing in his home section.

It has cost the American farmer and consumer literally billions of dollars in slow, small, costly, tedious hauling and frequent inability to get products to market. Inability to deliver regularly and at will on account of poor roads produces the most gluts and market dearths, which result in wide, unreasonable, and disastrous fluctuations that add largely to the cost of living, and farm failures.—B. F. Harris

Manufacturers of auto trailers report sales steadily increasing.

HE'D TRIED IT AND KNEW

Willis—Why don't you pronounce these foreign names correctly? Don't you know how?

Gills—Sure, but if I did nobody would understand what I was talking about.—Judge.

THERE'S a reason for everything. Nothing ever "just happens." My success with poultry is not an accident or a matter of "luck"—here are the three reasons my hens pay:

The FIRST reason:

My success begins with the baby chick. I start them on the right feed, and in that period when baby chicks so easily sicken and die, the pure dry buttermilk in Globe "A-1" Baby Chick Mash, and the fine balance of ground grain, grain hearts and meatine, builds them to vigorous youngsters, makes them grow, and acts as a safeguard against disease.

The SECOND reason:

My growing chicks are well fed. Experience has taught me not to "stint the ration and stunt the bird." During the stage of rapid growth, when the making of bone, muscle, flesh and feathers demands feeds high in protein, Globe "A-1" Growing Mash (containing Dry Buttermilk) brings them to maturity as strong, healthy birds ready and fit to lay.

The THIRD reason:

I know that it takes feed to make eggs—and so I feed an egg ration—Globe "A-1" Laying Mash (containing Dry Buttermilk).

DE LAVAL

the world's cream saver

"He wanted to see them start right"

Thousands of De Laval Cream Separators have been sold to young people just beginning to run a farm, because a father or friend wanted to see them start right.

The older people know from experience that the De Laval skims cleaner, runs easier and lasts longer. They also remember the service they have always received from the De Laval Company and its agents.

The superiority of the De Laval and the uninterrupted service back of it are responsible for the fact that there are more De Lavals in use than of all other makes combined.

Any time is a good time to buy a De Laval Cream Separator—to start saving cream, as well as time and energy.

If you want to "start right," see nearest De Laval agent. If you do not know his name, write to nearest De Laval office

Three Methods for Estimating Milk Prices

By Dean Hunt of State University

Dean Hunt of the University of California college of argiculture in a letter to R. W. Hodgson, farm adviser for Los Angeles County, presents three methods of estimating the reasonable price of milk at a given place or time:

"These threo methods are more or less applicable to all commodities but would appear to be particularly applicable to the price of milk at the present time. They are: Cost of production plus reasonable profit; Price compared to increase or decrease in price of other commoditios; Effect of price in securing necessary supply.

"Among the items which may be considered in determining the cost of production are: Land rental, price of eows, effect of climatic conditions on pasture, price of hay, grain and other feeds, price of equipment and repairs, wages and board of milkers, transportation, depreciation on eows and equipment, taxes and insurance.

"For seasonal reasons, some of these items are extremely variable, both from month to month and, especially in California, from year to year. For example, the cost of producing milk in 1915 was quite different from the eost in 1918. Data aceurately compiled and covering a sufficient number of cases may indicate what the cost was, but not necessarily what it will be or what it should be. For example, some of the dairymen included in any given survey may be unnecessarily ineffieient or may possess 'boarder' eows. With the recent inflation of currency, it is generally recognized that the commodity index offers the best standard of comparison. In order to compare wholesale prices, Bradstreet's index of 96 wholesale commodities furnishes a satisfactory standard. This index on December 1, 1919, indicated that it required $2.26 to buy as much of these 96 commodities at wholesale as $1.00 would buy during the average of five years preceding the war. Nothing was high at wholesale, therefore, on December 1, 1919, that did not cost $2.26 as eompared to $1.00 in pre-war times. Probably the best index for retail commodities is the one published by the United States department of labor.

"A supplementary, but perhaps less accurate, method would be to eompare the price paid by creameries for milk for the production of butter and other commercial products as compared to the wholesale price of market milk, since these two classes of milk are in competition with each other. Thus, if we should find that the price paid the farmer for butter fat for the five years preceding the war was 33 cents per pound and the wholesale price of 3.6 milk was during the same period 16 cents per gallon, we would conclude that when the creameries were paying 70 cents for butter fat, the wholesale price of market milk to sustain the same relationship should be 33.9 cents per gallon. I do not mean to say that these prices have actually existed. I am merely using this eoncrete example to illustrate the principle. Obviously, the usefulness of this method is in part dependent upon whether the dairyman was in pre-war times getting a living wage.

"Obviously, so far as the consumer is eoncerned, he is paying a given price in order to obtain a sufficient and regular supply of milk of a desired quality. If a certain price brings an insufficient supply of this quality, he must necessarily increase the price. If, on the other hand, a given price brings too much milk into the city to maintain a regular supply, the consumer must be charged more than is necessary. Unfortunately, the price that brings about this condition has not materially benefited the producers of milk, that is, the man who actually owns, feeds and milks the cows, because the surplus has been converted into cream, butter, cheese or other products which have sold for a less price.

"Thus, to take an extreme case, suppose that the price necessary to bring a sufficient and regular supply of milk of a desired quality is 30 cents per gallon. If a price of 45 cents per gallon should be artificially set, with the result that twice as much milk is delivered as is needed, tho surplus must be turned into butter or other low price products which may return only 15 cents per gallon. Under these circumstances the net return to the producer can be only 30 cents a gallon less overhead expenses. In other words, any surplus over that necessary to insure a regular supply not only creates an increased charge to the consumer, but in the long run is of no advantage to the producer of milk, that is, the man who owns and feeds and milks the cows. Any such excess is an economic waste. It is of advantage to no one.

"It is of particular importance to the producer to have this waste stopped because it curtails the demand for his commodity without increasing the net priee which he receives. It is of the utmost importance to society, because anything which unnecessarily curtails the consumption of milk, not only by babies but by children and adults as well, lessens the health and vigor of the city population. Any plan of betterment of the milk supply of a city, therefore, should give careful consideration to this question, which is only a phase of that old question which people so often try to beat but cannot—supply and demand. The blind senator from Oklahoma once remarked on the floor of the upper house that there were three things that appealed especially to the imagination of the people, namely; squaring the circle, perpetual motion and price fixing."

1920 FAIR DATES FIXED

At a meeting held in San Francisco, Monday, January 4, managers of a number of the leading Western fairs met and organized the Western Fair Association.

C. R. Thomas of Los Angeles was elected president; Frank M. Rothrock, Spokane, vice president; Charles W. Paine, Sacramento, secretary-treasurer, and Walter C. Ficklin of Fresno and O. M. Plummer of Portland, members of the executive committee.

The following dates were placed in a tentative program: Sacramento State Fair, September 4 to 12; Tulare County Livestock Show, September 14 to 18; Hanford, Kings County, Fair, September 21 to 25; Glenn County Livestock Show, September 27 to October 2; Fresno District Fair, September 28 to October 2; Los Angeles Livestock Show, October 2 to 10; Riverside Southern California Fair, October 11 to 16; San Francisco, International Livestock Show, October 16 to 24; Spokane, Western Royal Livestock Show, November 1 to 5; Lewiston, Northwestern Livestock Show, November 8 to 12; Portland-Pacific International Livestock Show, November 15.

NEW IDEAS ON ANIMAL DISEASE

At the short course at Davis, Dr. K. F. Mayer, of the Hooper Foundation of Research of the University of California, drew attention to the similarity of bacillus abortus of Bang of contagious abortion to the B. melitensis of Malta fever, and pointed out that all abortion disease of cattle is not due to the bacillus of Bang. He suggests importance of pasteurizing certified milk.

Dr. Edward Rocords of the veterinary control service of Nevada, in diseussing the so-called hemorrhagic septicemia in Nevada and California, which has proved such a baffling problem, objects to the use of hemorrhagic septicemia and suggests the popular term, "Red Water," although this is also applied to Texas fever. Dr J. J. Frey of the state department of agriculture advises that all cattle owners in anthrax districts immunize all cattle during spring or early summer, by vaccinating, using triple injections of spore vaccine.

CATTLE PROTECTION BOARD MOVES

The office of cattlo protection has been moved to the Sacramento headquarters of the department of agriculture. All letters, checks and remittances should be addressed, Division of Animal Industry, Department of Agriculture, Sacramento, California.

INTERSTATE SHIPMENTS OF CATTLE

The United States bureau of animal industry regulation seven now prevents the sale for interstate shipment of tubercular cattle, except when shipment is so marked or designated.

Going! Going!

To the Highest Bidder

Will It Be You?

I have cried registered Duroc-Jersey sales from Oregon to the Mexican line, but never before have I had the opportunity of offering to my friends and customers such high-class stock as will go under my hammer at the Diamond Bar Ranch sale.

Think of it! You can secure at your own prices sows and gilts of the same blood lines as animals that have been establishing world records in both sale and show ring back in the Corn Belt. Some of the sows are full and half sisters to these world record animals, and they are bred to boars that not only represent the best blood lines of the breed, but have won in the show ring this season and established enviable reputations for themselves.

This is your Big Opportunity to get started right or to improve an established herd. Don't let anything on earth prevent you from attending the sale.

Ord L. Leachman, Auctioneer

Public Sale Wednesday, January 28

Sale to be held Under Cover, Rain or Shine

40 Duroc Sows and Gilts

CHOLERA IMMUNE

SOMETHING FOR YOU IN THIS OFFERING

If you are looking for the best in Durocs you will not be disappointed, for we believe that this is the only sale west of the Rockies where Pathfinder and Sensation sows, bred to Pathfinder and Sensation boars, will be offered. You can't beat that breeding.

10 Two-Year-Old and Senior Yearlings

By Model Chief 2d, Model Triumph and Councilor.

10 Fall Gilts

By Bark's Premier Guano, King's Col., Golden Col. and Creator.

10 Yearling Sows

By Pathfinder, Great Wonder I Am, Pathfinder's Wonder, A Top Pathfinder and Creator.

10 Spring Gilts

By California's Great Wonder, the undisputed Champion of 1918.

Bred to Grand Champion Boars

Ace of Pathfinders

Grand Champion at Los Angeles, and second to the World's Champion at National Swine Show.

Mammoth Sensation, Jr.

Reserve Grand Champion at State Fair, and the largest junior yearling shown.

Great Sensation 2d

Winner in his class in 1919. Grandson of Great Wonder I Am, and a future champion.

We are holding the sale at the ranch so that you will have an opportunity to inspect our herd — to see our three great super-sires; our scores of big, motherly sows; our hundreds of growthy young pigs. Also we want you to see our model hog plant and notice the favorable conditions under which our stock is raised.

Attend the Sale
Visit the Ranch

How to Get There

Ranch is near Spadra on the Valley Boulevard, 28 miles east of Los Angeles and 4 miles west of Pomona. See big sign at gate. The Orange Belt Line (A. R. G. Busses) and White Bus Line run motor stages every half-hour from the Union Station, Fifth and Los Angeles Streets, Los Angeles. Similar schedule from Pomona.

The Big Poland China Sale

My next big Poland China sale will be held on my farm one mile north of

Ripon, Cal.

Thursday, January 29, 1920

What I Will Sell

From my herd of 85 sows and gilts of breeding age I am selecting fifty head that I believe will please any buyer looking for good Poland Chinas whether he be breeder or farmer. I am particularly anxious that this sale come up to present day standards so I am choosing some of the best animals my herd affords.

Compare the Breeding

I solicit a comparison of the sows and gilts in this sale with that of any ever offered. Pay particular attention to the sizes of the animals in this sale. They are by such noted boars as:

King's Big Bone Leader, Giant Bob, I. B. A. Wonder, Young Jumbo, Joe's King, California Wonder, Model Major, Caldwell's Big Bob, Blue Valley Tecumseh and Forrestview Bob.

And will be bred to

King's Big Bone Leader and Giant Bob 2d

(The 1918 Grand Champion Boar) **(A son of the 1919 Grand Champion)**

Where will you be able to buy at any sale this year a greater lot of Poland Chinas?

Special: Farmers and Dairymen

I appeal to every farmer and dairyman to attend this sale. Whether you buy or not I want you to see the kind of hogs I am raising. The time is past when any kind of a hog will do. It has been definitely proven that pork can be produced more quickly and more economically by the use of pure breds. I believe you will enjoy visiting my herd so I invite you to be my guest on this day. I believe you will be glad you came.

Object of this Sale

The real object of this sale is to interest more farmers in my community in raising pure bred Poland China swine. Our county needs more good hogs. We need more Poland China breeders. The demand is here. The Poland China hog has proven to be the greatest hog raised in the United States and we need more breeders to help supply this demand. I hope my sale will be the means of starting a good many new breeders. While I know that some of the offering will go into already established herds, I am particularly anxious that the greater part of it remain here in our own community. That's why I am giving you a special invitation, why I urge you to come to this sale and help me make this the greatest Poland China center of the state. I will do all I can to assist you in raising and selling your stock. Come on, let's all work together for better hogs and more profit.

AN ATTRACTIVE FEATURE

of this sale will be a Caldwell's Big Bob sow bred to the grand champion boar *King's Big Bone Leader*. This sow was first prize senior yearling at the last state fair.

This litter will be exceedingly valuable and sell for big money.

A catalog of this sale will be mailed you on request and will give you a lot of interesting facts.

Sale starts promptly at 12:30 P. M.
Lunch served at 11 A. M.

Remember the sale will be held on my farm one mile north of Ripon and there will be ample protection against bad weather.

Geo. W. Bell, Tulare, will be the auctioneer.

Les McCracken Ripon, Cal.

The Breeder's Opportunity

During the past few months a number of articles have appeared in the Cultivator relating to the splendid development going on on all sides of the livestock industry in this state.

The general tone of such articles has been hopefully optimistic, but from time to time mild admonitions to those engaged in the pioneer work have been ventured—not because we have felt any real or present necessity for a word of caution, but because we have felt that there might be and because the future development will depend upon what foundations these pioneers have laid. While the writer in no wise wishes to appear to know all there is to know about livestock (as a matter of fact, the longer he associates himself with the livestock industry, the more modest and hesitating he grows!) he has had more or less experience with the industry in this state as well as in some of the older sections, and his past work has been such as to afford an opportunity to study the general aspects of the business, to observe the methods of the more sucessful breeders, to learn a few of the many reasons for the failure of some, and to develop a deep seated appreciation of the real economic value of a better quality of livestock. He has watched with the highest satisfaction the ever broadening conquests of the improved breeds, and, he has noted with thousands of others, the leavening influence of good blood on the common stock of this country. He has also become familiar with certain practices and motives that have fastened themselves upon the industry in the older sections to the distinct detriment and retarding of the various breeds.

If it appears that we devote too much space to the general proposition, it is only because we are so thoroughly convinced of the real opportunity that is open to the livestock producers of this state, an opportunity that is not approached anywhere, and because we are anxious to do what we can in establishing the business on a thoroughly sound, conservative and permanent basis, that will result in the greatest good to the state as a whole. We believe firmly in the ability of well selected stock of the various breeds to increase the efficiency of the business of producing livestock, and thereby increasing the net profits of those engaged in the business, thus making it possible for all to enjoy to a greater degree the things held most worth while. For that reason, and that reason alone, we find justification for our efforts in the cause of better livestock. And for that reason, and that reason alone, will any man who engages in the active affairs of a breed find his justification.

The movement toward a more efficient class of livestock is infinitely bigger than any man or set of men and the general trend is irresistible. Possibly from time to time certain factors may tend to retard the natural course of progress, but such interruptions are only temporary—the onward sweep can not be stemmed. And just here it might be well to suggest that in the end the destinies of a breed or the men identified with a breed will depend entirely upon whether or not development has followed the cold hard headed ideas in the mind of the average farmer or ranchman. Breeders must keep this fact in mind always: The great bulk of producers care not one whit for a fad or fancy that does not have practical value. The average man simply wants proof that the claims made for pure bred livestock are so, and it is therefore up to the breeders to furnish that proof—and they have abundant evidence. The gravest mistake one can make in taking up the breeding business is to get the false notion that registered livestock offer a quick cut to wealth and that price and show yard records are the two goals to aim for and that the goals can be reached in a short time. The big thing to plan for is to produce the kind of stock that will best meet the needs of the average man. With that accomplished the market for surplus will very largely take care of itself—but it can't be accomplished in a day—or year.

California breeders are today in an enviable situation. This state is, practically speaking, a virgin field. Every class of livestock is in demand. We know what can be accomplished by well directed effort. Because of the newness of the industry in this state, our breeders and those agencies closely identified with the development of the livestock industry are free from all influences that have worked harm to the business in the older sections, and if we are wise we will keep our business free and build upon a sane and conservative basis, the foundation of which will be a clear conception of the real value of better blood.—R. P. R.

SOUTHERN CALIFORNIA JERSEY SALES

January 22 and 23 should prove red letter days in Southern California for buyers looking for pure bred, tuberculin tested, registered Jersey cows.

On January 22 Mr. E. E. Shattuck is disposing of his selected herd of 15 Jerseys, at Rhoades & Rhoades stock yards at Clearwater, most of which are two year old heifers, and the majority of which are due to freshen in the near future. These heifers are in calf to the great young sire, Eleden Stoke Pogis whose dam was a R. O. M. cow. They are all sired by St. Lambert's Golden King whose dam has a R. O. M. record of 700 pounds of butter fat in a year. Both of these bulls will be sold at the sale.

January 23 The Arden Dairy will sell every registered Jersey on their ranch near El Monte. This herd includes 110 head of corking good females that combine type, breeding and individuality. There are also 15 bulls, from calves to those ready for service. There are a large number of springers in this herd and a number just fresh.

The above sales will be conducted by Rhoades & Rhoades of Los Angeles.

LIVESTOCK SALE CALENDAR

Holsteins

January 30. C. F. Mohnike, Angiola.
Thursday, March 25, Guaranty Sale, Sacramento.
April 8. Breeders Sale, Tulare.
Wednesday, April 21, A. M. Bibens, Modesto.
Wednesday, May 12, Leeman & Kilgore, Dispersal, Ripon.

Herefords

During last week of February, Pacific Coast Hereford Cattle Breeders' Association.

Shorthorns

April 17, Butte City Ranch, Butte City.

Berkshire Swine

February 14. J. Francis O'Connor, Santa Rosa.
February 16. Muddux & Son, Sacramento.
February 18. Western Berkshire Congress, Davis.
April 17. Butte City Ranch, Butte City.

Duroc-Jerseys

January 28, Diamond Bar Ranch, Spadra, Los Angeles County.
January 29, Winsor Ranch, Bonita, sale in Los Angeles.
January 30, Ireland Ranch, Owensmouth, Los Angeles County.
February 4. Fresno County Duroc-Jersey Breeders Association, Fresno.
February 10. Glenn County Duroc-Jersey Association Sale.
February 18. Tulare County Duroc-Jersey Association Sale.

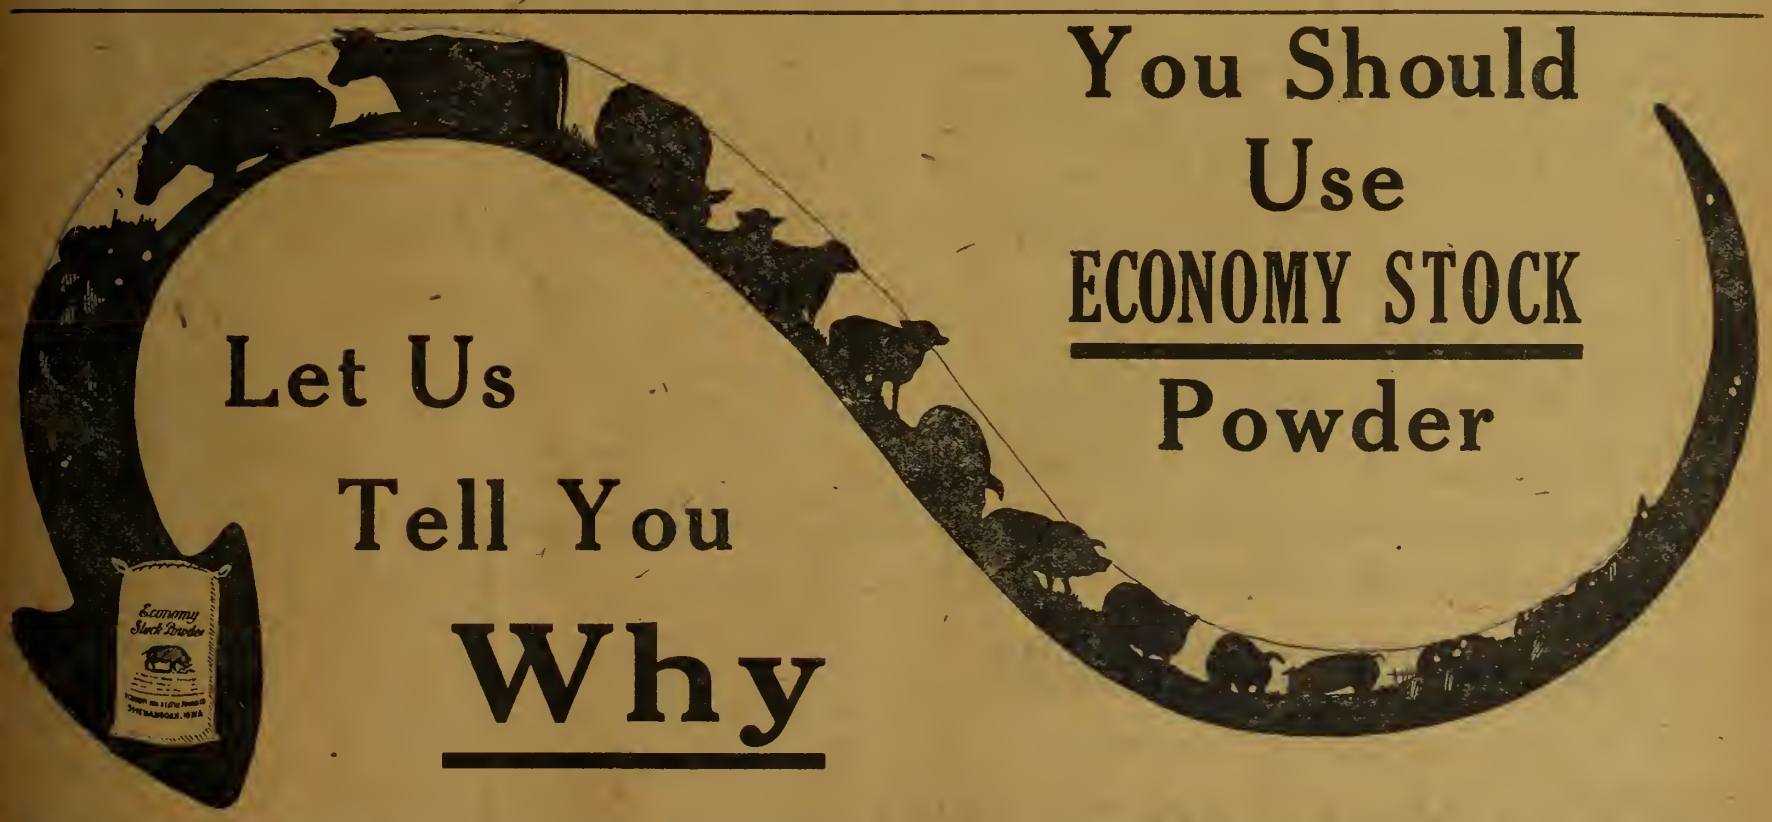
April 17. Butte City Ranch, Butte City.

Shetland Ponies

April 17. Butte City Ranch, Butte City.

Shropshire Sheep

A school of agriculture boy sold $800 worth of melons from an acre of land last year. He kept an accurate record of all operations and can tell just what they cost him to grow. That kind of bookkeeping pays on any farm.



You Should Use ECONOMY STOCK Powder

Let Us Tell You Why

FOR: HOGS—CATTLE—SHEEP—HORSES

BECAUSE
It acts directly upon the affected parts.
It expels all worms.
It aids digestion.
It suppresses fever in the stomach.
It cools the blood.
It loosens the bowels.
It sweetens the stomach.
It aids mastication.
By feeding the powder in connection with grain, the animal will extract 10 to 20 per cent more of the nutritious qualities.

In our compound are Poke Root, Bloot Root, Sulphur and other ingredients which act upon the kidneys, liver, spleen and blood; a filterer of charcoal to absorb the impurities of the digestive tract; Worm Seed Meal in sufficient quantity to destroy all worms and the four sodas which excite the secretion necessary to healthy digestion, sweeten the contents of the stomach and bowels and remove all impurities from the tract; claims which have been verified time and again by the testimony of our customers, which testimony is based upon their experience with and the benefits derived from the use of our goods.

Bunting's Mission Herefords Are Profitable

They will increase cattle profits by adding pounds of beef to every steer sold. For the best of breeding and individuality visit my herd and see the kind that win at the best shows. Prices reasonable. You'll be welcome.

JOHN A. BUNTING

Mission San Jose Calif.

DIAMOND G HEREFORDS

are the kind that make good under all conditions. They have the size, bone and constitution that the range operator wants. Herd headed by Don Perfect 2d one of the best bulls in the West. Correspondence invited and visitors welcome.

H. H. Gable Esparto, Calif.

Beef Cattle Specialis

For 30 years I have been devoting my entire time to pure bred beef cattle. I know the kind of cattle California needs and where and how to buy. I make regular trips to the great producing centers and will buy on order. Best of references. Satisfaction assured. Correspondence invited. R. M. DUNLAP, Hotel Land, Sacramento, Cal.

How to Ship a Hog by Express

G. W. Tucker, a special agent in the employ of the Railway Express Company recently offered some practical suggestions to the readers of the Poland China Journal as to how to prepare and ship hogs by express. In view of the numbor of hog sales to be held in this state this spring, tho suggestions will provo of help to breeders. Mr. Tucker says in part: "In preparing a hog for shipment by express the first thing necossary is to build a crate to suit the size of the hog. You know that when a man goes to his tailor for a suit of clothes the tailor takes his measurement. This is for a live man. The same thing should be done for a live hog. It is possible to have a crate too large or too small.

When the average hog is taken from the herd and crated for shipment it becomes restless and if the crate is too large it gives the hog room to tear out of the crate. A crate should be at least four inches longer than the hog from the end of its nose to the fleshy part of the ham, when the animal is lying down. The width of the crate should be as wide as the hog is in depth, and not the width of the hog across the back when standing.

A crate should be built of lumber one inch thick and 12 inches wide for the floor and with three cleats one inch thick and four inches wide. These cleats should be put on the inside of the floor. When a sow is being shipped, and she is near farrowing time, instead of putting loose straw in the crate, as is often done, a gunny sack filled with a reasonable amount of straw should be tacked down in the front part of the crate but far enough back so the sow cannot reach it with her teeth and tear it. In this manner the sow is protected from the jolting of the express car while in transit. It will also prevent her slipping on the wet floor of the crate. In the summer time, when the weather is hot, a little sawdust put in the crate underneath the sack is an excellent idea. The sawdust will hold the moisture and have a tendency to keep the animal cool, when water is poured underneath the hog's belly.

Always avoid pouring water on a hot hog's back. If, for any reason, a hog should become overheated the animal can be cooled out by bathing the front legs and by swabbing out the mouth. The nose and the top of the head also should be bathed.

In completing the crate you should build the sides and front end of lumber one inch in thickness by four inches in width. The top slats should be of the same material. The rear end of the crate should be made of an upright board one inch thick and eight inches wide. The eight inch board is intended to save the hog's tail from the danger of being injured by dropping outside the crate and being cut off, which often is the case when two four inch boards are used. When shipping a boar a gunny sack with a small amount of straw can be swung in the rear of the crate for protection. In building the sides of the crate one should see that the slats are nailed from the inside and that the nails are cleated on the outside of the upright pieces. If a hog weighs over 150 pounds three upright pieces should be used on each side of the crate. The two slats on top of the crate should como flush at the ends of the crate. An eight inch space should be sawed at the rear of the crate in order to allow the rear upright board to drop. Care should be taken by the shipper to put the one nail needed in the end of the crate so it will reach through and into the slat on the crate. for if it is put through the four inch piece on the rear of the crate to hold the upright eight inch piece it will often tear the hog.

In putting a crate loaded with a live hog upon a platform or into a car door the head of the animal always should be put up first. In unloading from a car door or from a truck, the rump of the animal should come down first.

In every case where an animal is to travel a long distance a watering trough should be provided in the crate. The shipper must attend to this and he should also provide a small amount of corn in a sack and this should be attached to the crate. The feed is not to be used on account of hunger of the animal but a few grains of corn often will quiet it so it will lie down and rest while riding in the express car, just as if it were back on the farm.

The important feature of marking a crate is to see that at least two tags are used, and above all things do not tack these tags on the top or side of the crate. They should be placed on the top slat on the front of the crate in such a manner that the name can be readily found. By placing the tags on the crate in such a manner it will nearly always insure the animal's having its head toward the light and the fresh air in the car. Also the animal's head should be turned in the direction the train is moving. Avoid permitting a hog to remain in a crate with the crate standing in the sun or cold weather.

The Mushroom

In the January number of The Shorthorn in America, the quarterly magazine published by the American Shorthorn Breeders Association, the editor, Frank D. Tomson, draws from his rich fund of experience the following practical observation:

"Occasionally some enthusiast makes his initial investment in registered livestock, perhaps possesses the spirit of a plunger, and attracts a good deal of attention to his apparent motives. There are few who hail him as a good fellow and an important addition to the breeding ranks. They flock around him; they pat him on the back; they exert themselves to introduce him to many others, and in their enthusiasm for him they often overlook the established breeder who has worked long years to improve the breed with which he is identified. Perhaps this new 'Richmond in tho field' inclines to buy the tops at various sales. If so, there is never any lack of boosters that cheer him on his way. But after a time his operations, so far as he is concerned, begin to take on a more serious aspect. There are problems requiring sober thought The buoyancy may subside, and in time he may tire of the game. The enthusiasm that characterized his spectacular entry into the business may pass, and those who were so ready to draw attention to his upward flight may be busy elsewhore when he fails of further ascent. Perhaps he becomes restive, and for lack of practical knowledge of the business of livestock production he may place his entire holdings on the market and make his oxit from one of the most interesting and useful vocations in the world. There have been a good many such instances, but every year witnesscs a larger number of those who intelligently 'play the gamo'; those who have a definite purpose in mind; those who recognizo that the produc

The Next Eventful Day of Interest to POLAND CHINA BREEDERS

Will be the BIG SALE to be held at

FRESNO, Monday Jan. 26, 1920

75 head of big type Poland Chinas—the entire herd of Chas. Gatewood—will sell, including the 1919 grand champion boar, GIANT BOB. An animal from this famous herd will return a substantial profit to the buyer and add lustre to his herd.

35 sows and gilts bred to Giant Bob, 10 bred to Prospoctor and Gatewood's Prospect, 6 boars and about 25 open gilts. These open gilts will be just the thing for a fall sale.

In this sale you can buy sows that have the class of champions, bred to champions and will bo tho mother of champions.

SALE starts at 10:30 A. M. LUNCH at noon

For Catalog address

GEO. W. BELL, Tulare, Auctioneer CHAS. GATEWOOD, Fresno, Ca.

Mr. Gatewood's Statement

Due to poor health I am forced to disperse my entire herd of big type Poland Chinas. In Giant Bob I knew I had a great boar, so last spring I went East and purchased a car of sows and gilts that I thought would mate well with him. I personally selected each individual and saw their sires and dams as I had expected to retain most of them in my own herd. I wish to call particular attention to the two young boars in the sale—Prospector by Long Prospect out of Big Bob dam and Gatewood's Prospect by Wade's Prospect out of Long Prospect dam. I believe these two young boars are wonderful prospects and if properly developed will make great herd headers. I do not believe anyone will be disappointed in the offering.

The Cow's UDDER Must be Healthy

No use trying to force the cow's production if the milk-making organ—the udder and teats—is not perfect. The slightest congestion or injury will immediately interfere with the easy "giving down" of the milk.

Bag Balm is a soothing ointment of extreme penetrating power. In Caked Bag, Cow Pox, Bunches, etc., the injured tissues are quickly softened, inflammation removed and the normal texture restored. Bag Balm promptly relieves chapping, chafing, inflammation and any extreme sore or tender condition.

Thousands of dairymen would not be without a package of Bag Balm in the cow barn. It's a little investment for warding off serious troubles. Sold in generous 60c packages by feed dealers, druggists and general stores. Free booklet, "Dairy Wrinkles," on request.

tion of improved livestock is a business to which business principles need to be applied. Many so-called enthusiasts seem to regard the entry into this useful business of men who incline to the spectacular as of fundamental value and importance to its progress. They overemphasize the value of such an investor and are apt to underestimate the man who makes a modest beginning, the man who quietly makes his initial purchases, who lays the foundation of his herd without attempting in any way to attract special notice. But the passing of time emphasizes the permanent value of the latter class.

"To those long familiar with the trade of improved livestock development this is an old story. There is a difference between publicity and achievement. There is a difference between publicity based on achievement and publicity based on the spectacular. It is well for any one interested in the vocation of producing registered livestock to properly gauge these things. It is well to attach appropriate value and not lose sight of the fundamentals—the basis on which our business rests.

"The man who becomes identified with the cause, however active he may be, if his operations are concluded in a brief period or when the first serious problems are up for solution, is of little permanent value to the cause. On the other hand, the breeder who begins at the bottom and gradually works upward becomes a permanent asset to the industry.

"We recognize that the very nature of the business invites to a greater or less extent performances that are spectacular, but we also recognize that the spectacular performances are more apt to characterize the activities of the transient—the mushroom—the man who seeks the spotlight—than those of the man who becomes a fixture, who plays a useful and important role in the building of a breed of improved livestock."

THE GROWTH OF THE GUERNSEY HERD REGISTER

It is rather significant that ou New Year's Day, 1920, the total number of registrations of Guernsey cows should have passed the 100,000 notch. On that day there were 100,009 cows and 61,411 bulls in the Register. This makes a total of 161,420 animals.

On May 16, 1894, when the office was turned over to the present secretary's care, there was a total of 11,060 animals registered. This means that 150,360 registrations have been made in 25 years.

During 1919, a total of 18,118 Guernseys was registered. Of these 7,111 were bulls and 11,007 were cows. The number of bulls registered in 1919 is almost double the total number registered for the first 17 years of the club's existence, which was 3,708, and is more than 150 per cent of the number of cows in the same period, which was 7.352.

A closer analysis shows that during the last six years the Herd Register has more than doubled itself, 33,664 bulls and 50,971 cows having been registered.

SWINE BREEDERS TO MEET IN FEBRUARY

The California Swine Breeders Association will hold its annual meeting at the university farm, Davis, during the Livestock Week which is scheduled for the last week in February. Besides the election of officers to serve the coming year, an extensive and interesting program covering all the phases of the swine industry is being arranged. C. B. Cunningham of Mills is president of the association and Professor J. I. Thompson of the University of California is secretary.

GUERNSEY BULL SOLD FOR $16,400

High Point Cavalier 41924, a two year old Guernsey bull, has recently been sold for $16,400, by C. D. Cleveland, Eatontown, New Jersey, to W. H. Gratwick, Buffalo, New York. This price has been exceeded in the breed only once in private sale and once at a public sale. This sire is the first calf out of the splendid cow, Cavalier's Helen 65648, a daughter of Langwater Cavalier 21012. His sire is Ultra May King 27600, a son of Don Bernardo of Linda Vista 20617.

40 Bred Duroc-Jersey Sows and Gilts

Tulare County Duroc-Jersey Breeders Association

A Message to Hog Breeders and Farmers

By Professor J. I. Thompson Animal Husbandry Division. University of California

IN November, 1915, the Berkshire breeders held a public auction of hogs at the P. P. I. E. grounds in San Francisco. In January following the California Swine Breeders Association held a consignment sale of all breeds at the fair grounds in Sacramento. So far as my information goes, these were the first two auctions held in this state where only hogs were offered.

Practically all of the sales held for some time after were consignment sales, for no single breeder had enough hogs or cared to assume the risk of staging a sale alone. However, the number of herds of pure breds has increased so rapidly that within the next few weeks a very large number of individual and of combination sales will be held. One paper carries in its last issue announcement of 30 different sales.

The question to be seriously considered by the various consignors is whether or not they are paying sufficient attention to the kind of advertising that will induce men not now engaged in the raising of hogs to buy one or more and persuade the breeder of grade hogs to invest in some pure breds. Unless these two classes can be convinced of the merit of the pure bred the sales record of the present season will not be what it should. Many pure bred breeders have been so busy improving their own herds that they have found little time to do missionary work for the extension of the pure bred business among their neighbors. It must be done and done quickly, and present conditions offer an excellent opportunity. Market hogs are selling at lower prices than has been the rule for some time. Grain is as high or higher than normal. Even though grain is high a very considerable part of it must be consumed by livestock or the bottom would drop out of the market.

It has been demonstrated time after time that a good pure bred is the most efficient machine for converting raw material into human food. A pure bred hog eats more than a scrub and does it more efficiently. He grows faster, breeds more uniformly and suits the market better when he is finished.

At the recent San Francisco Livestock Show both pure breds and grades were entered in the carcass competition and judged by a butcher. In neither class was a grade placed ahead of any pure bred, and the butcher's estimate of the value of the carcasses was two cents per pound higher on the poorest pure bred than on the best grade.

Not long ago my attention was called to a case in point that well illustrates the efficiency of better bred hogs in the general scheme of pork making. A rancher purchased a number of medium priced pure bred sows These sows were put in with his grade herd and carried along in exactly the same manner. When they farrowed all the pigs were given the same feed and care. In a few months they were weighed and the grade pigs weighed around 105 pounds and the pure breds —with the same care, remember— weighed 147 pounds. That is a practical demonstration of the value of pure breds and that is the reason the more progressive farmers are turning from grades to pure breds. It is a matter of good business.

So it goes the country over. At the recent International at Chicago the grand champion pen, pure breds of course, were said by butchers to be the greatest that ever won this award.

During the war pure bred hogs replaced more grades on corn belt farms than had been the rule in the ten previous years. There is a reason. Farmers for the first time found it necessary to keep careful records of their cost of production. Grain was relatively higher than hogs. They found that only the most efficient hogs paid. The result was that the price of the best pure breds began to ascend until the record price for a boar now stands at $30,000.

The shifting from grades to pure breds has not been confined to hogs alone. Dairy cattle, beef cattle and sheep breeders have done the same thing. A few years ago cattle from the range districts were not seriously considered by the buyers of the best feeder cattle. For the past two years the winners of the grand champion carload of steers at the Chicago International were bred on the range. What has made the difference? The reason is easily stated. Pure bred bulls have been used exclusively by an enormous number of range men, and the herds which produced the above mentioned champion carloads have had nothing but pure breds in service for ten years.

No accurate records of the relative number of pure breds to grades in this state are available, but it is a safe guess that the percentage of pure breds is much smaller than it should be. Breeders of grades must be shown that their best opportunity for profit under present conditions is to use the best available machine to convert their raw products into finished ones— and that machine is a good pure bred sow.

In Arizona

Cattlemen in Arizona in the cattle feeding business will be interested in the following comments by Dr. R. H. Williams, animal husbandsman of the university, in answer to a request from an Arizona stockman for information on feeding:

"The present offers an interesting study in the cattle feeding situation in Arizona. Last year most cattle feeders lost money and because they did not have their cattle ready for market before April 1 they lost heavily by the slump at that time. I do not know anyone in Arizona feeding as many cattle as they did a year ago and the large outfits are especially conservative in putting cattle on feed.

"Another feature intimidating expansion in cattle feeding this year is the high price of feeds. With alfalfa hay costing $25 to $30 a ton, milo maize $50 a ton, cotton seed meal $72 and silage $9, feeders estimate that the high feed bill will eat up the profits of feeding.

"I have met quite a number of the cattle feeders and nearly all of them state that they are limiting their operations this year. It just occurs to me that it would be a good plan to get into the cattle feeding business because there will certainly be a scarcity next March and April. We cannot expect the market to follow the same price fluctuations that obtained a year ago, and apparently there should be a good market for well finished cattle in March and April. It is true that the desert looks especially promising at the present time, but the old-time cattlemen claim that Indian wheat and desert forage seldom become sufficiently mature to force gains before the middle of April and range cattle are never fat enough for the butcher until the middle of May from desert ranges. Certainly the feed lots will be scraped clean before the middle of February and after this time it is expected that the price will be high.

"The high price of feeders at the fall round-ups also checked the feeding operations. Feeders who own cattle ranges sold their animals instead of putting them into the feed lot and certain ones after having been on pasture a month were turned back to the range on account of the uncertainty of the market. It is extremely difficult to anticipate what the market will do in the next three months. Uncle Sam reports that we have about ten million more cattle in the United States than we had before the war Apparently corn belt feed lots were not filled up with cattle this fall and from all one can gather there will be a big demand for fat cattle during winter months. The uncertainty of the European outlet, also the uncertainty of the consuming capacity of the American people, owing to the labor

crisis, makes it difficult to estimate the local demand for meats. If we have hard times in this country it will be actively reflected on the amount and kind of meat used.

"There are a great many dairy bred steers, mostly Holsteins, being fed in the Salt River Valley. It is just possible that cattle feeders will make money out of them, but if they do, those who raise them will lose. This means that inferior dairy bred steers are a losing proposition for somebody, and I would certainly recommend that all dairy bred grade male calves be killed witbin the first week after being dropped. I have seen quite a number of dairy bred steers during tbe past week and I judge there is not a yearling that has not eaten over $50 worth of feed and one cannot get more than $25 for them and there is not a two year old tbat has not eaten $125 worth of feed and you cannot get more than $50 for them. It is just possible that one could handle such steers on a short feed and make a little money from them, but I for one would hesitate to handle them. The dairy bred heifer from the standpoint of feeding and profit making has also been just as unprofitable as the inferior bred steer."

DAIRY PRODUCTS ESSENTIAL

Herbert C. Hoover gave to the world a message on cbild welfare work at a luncheon given by the Associated Charities of San Francisco recently. This message was remarkable for its sweeping indorsement of milk and other dairy products as necessities of diet for the human race. Mr. Hoover said:

"The basis of child welfare is health and physical development. The foundation lies in proper feeding. In its broad aspects the proper feeding of children revolves around a public recognition of the interdependence of the human animal upon his cattle. The white race cannot survive without dairy products. The problem of child feeding thus narrows itself practically to town and city children, because without such special thought there are available to country children ample supplies of these most critical articles of child diet.

"At the time of the armistice we were confronted with 200,000,000 underfed people who had been under German domination. It had been the habit of the German army to take the food supplies and cattle of all Poles, Serbians, Rumanians, Czechs, Finns and other oppressed peoples at the point of the bayonet in order that they might give preferential feeding to their own people. Due to denudation of cattle, milk had been unknown in many places for years.

"Whole populations were undernourished, but the children were suffering the most acutely from disease and malnutrition. The number of actual orphans and waifs had enormously increased, so that in considering the problem of the great famine that confronted Europe one of our first activities was to develop a method of saving the children. It appeared that tbe distant future of these nations would lie in the immediate rescue of the greatly debilitated children.

"Here, again, we attacked the problem both by prevention and by cure. The feeding of the children in the public schools in many of these countries was organized under their governments and milk and other supplies were furnished for this purpose.

"The feeding of 10,000,000 Belgian and French people was the first attempt ever made anywhere, so far as I know, at the mass feeding of a whole nation. There were no experts in the problem, but we sought such scientific advice as was to be obtained. We soon found, however, that tbe children were failing on a ration that should be ample for adults. Tbe number of debilitated children up to ten years of age greatly increased. The number of adolescent children developing tuberculosis increased in a disheartening degree. We decided to feed the children en bloc, apart from their parents. Something over 1,200,000 children of the Belgian and French towns and cities were thus put under systematic feeding, and this continued during the last three and one-half years of occupation. If you will go to Belgium today and examine the public health statistics, you will find that the disease mortality among children is less than the pre-war normal, in spite of the fact that they went through nearly five years of continuous famine."

WHAT IS A HIGH CLASS PURE BRED BULL WORTH?

"A good puro bred dairy bull may be worth several thousand dollars just from the standpoint of the milk production of his daughters," says M. H. Keeney of the University of Missouri college of agriculture. "It depends on the man behind the cows."

The following data from the first year's work of the Webster County Cow Testing Association reveals some very conclusive proof that the "bull is half the herd" and that he should be so bred as to be the better half:

	No. Cows	Ave. lbs. Butterfat	Ave. lbs. Milk	Return Above Feed Cost
1.	2.....	494.6	8,490	$244.56
2.	9.....	368.2	6,653	159.52
3.	70.....	284.7	5,781	110.39
4.	96.....	206.1	4,387	63.13
5.	23.....	128.6	2,950	48.51

Two cows in Class 1, of cows producing over 450 pounds of fat, show a profit averaging $224.56. Nine cows in Class 2, of cows producing between 350 and 450 pounds of fat, show a profit of $159.32. Of these 11 high cows six are daughters of one bull. He was a pure bred bull from a high producing dam. Both of the cows in Class 1 which show the profit of $244.56 are daughters of this bull.

It is evident that this bull can be held at almost any price and still be cheap. It isn't what you pay; it's what you get that counts. Such a bull might cost a few hundred dollars, or even a thousand, but he will repay the farmer his purchase price many fold. Compare the profit of his six daughters with the profit of the average cows and note the results. None of the good cows are sired by "scrub bulls." There can be but one conclusion, namely, "the scrub bull must go." He is the expensive animal, even as a gift. Knock him in the head; the quicker the better. A good pure bred bull is the only kind any dairyman can afford to own. They are cheap at any price because they produce the goods.

Cooperative ownership through bull clubs is solving the bull problem in Missouri. By pooling their money the bull club members are securing bulls like the one that sired the cows in Class 1, the kind whose daughters make large profits at the milk pail. Furthermore, the actual cash outlay is little more than the club members formerly had tied up in a scrub. Scrub bulls make scrub farmers. Pure bred bulls make prosperous farmers. Moral: Get into the prosperous class by using only a pure bred bull of high merit.

CATTLE AND HORSE HIDES INCREASE IN NOVEMBER

Increased stocks of cattle and horse hides and decreased stocks of calf and goat skins for November 29 compared to October 31, are shown by the monthly report of the bureau of markets. Percentage increases for November over October were: Cattle hides, 4.4; horse hides, 42.5; horse fronts, 27.1; horse butts, 12.1; kangaroo and wallaby, 1.3; cabretta, 4; pig and hog strips, 8.1; and other hides and skins, 763.8. Decreases in per cent were: Calves, 10; kips, 1; horse shanks, 19.3; colt, ass, donkey and pony, 14; deer and elk, 14.8; goat, 6.9; kid, 85.2; sheep and lamb, 7.8; buffalo. 5.3; and alligator skins, 91.

Total stocks given for November 29 included: Cattle hides, 6,719,202; goat, 14,248,129; sheep and lamb, 9,336,964; calves, 1,806,367; kips, 1,086,211; kangaroo and wallaby, 827,529, and cabretta, 2,677,336.

In a sale of Poland Chinas held by William Wrigley at his farm near Lake Geneva, Wisconsin, January 9, 36 bred sows were sold for $55,975, an average of $1,555 each, which is a new record for the breed. A press dispatch reporting the sale stated that an offer of $50,000 for The Clansman, the Wrigley herd boar and the sire of the $30,000 boar, Designer, Liberator and other famous boars was refused.

IRELAND RANCH

Donald H. Graham E. Avery Newton

Will Sell at Public Sale

Friday, January 30th, 1920

40 Bred Duroc-Jersey Sows and Gilts

Sale held on Ireland Ranch, Owensmouth, Cal.

The Offering Will Include

Four sows by Orion Cherry King 5th. In last year's sales sows by him averaged better than $700.

Three by Orion King Gano; one by Col. Orion Cherry King and six Crimson Col. gilts.

To the thinking breeder the animals to be sold in this sale will make a strong appeal. The predominating blood lines are Orion Cherry King and Defender.

Discriminating buyers will find it worth while to attend this sale.

Sale Starts Promptly at 12.30 Lunch Served

FRESNO DISTRICT DUROC-JERSEY BREEDERS SALE

FRESNO, CALIF.

Wednesday, Feb. 4 1920

-40-

Carefully Selected Bred Sows and Gilts

This offering has been selected from the following herds:

Fitzwilliam Ranch, Burrell, Cal.
R. M. Cross, Raisin City.
J. P. Mallory, Fresno.
Guy McClune, Fresno.
J. W. Schmitz, Madera.
J. G. Roberts, Madera
H. H. Bereton, Sanger
Harry Hill, Riverdale
R. H. Lewis, Riverdale
Hillcrest Farms, Caruthers

The sale is made possible by the above named breeders consigning a quality of breeding stock that they would prefer to keep. They are anxious, however, to direct attention to this district as a center for the best there is in Durocs. The offering will be found to be well grown, of modern type and of blood lines that are popular because they are demonstrated sources of superior stock. Every one of the consignors is a practical hog man and is raising Durocs because he knows that they are the most profitable. If you want that kind you should attend this sale.

For Catalog, address the Secretary

H. H. BERETON, SANGER, CALIF.

Better service is assured by the advertiser if when writing you mention the California Cultivator.

ANOTHER BIG RECORD IN HIDGON HERD

The consistent frequency with with large official records of milk and butter are being made at Tulare Holstein Farm, owned hy W. J. Higdon, Tulare, under the care of herdsman Harry L. Reed, fulfills the ostimates which observers of the herd made on the strength of the high breeding and individuality of the foundation animals. The latest large record made in the herd is notable in several ways, and aside from its indiviudal merit it adds greatly to the fame of one cow and largely to the value of a consilderahle number of near relatives. The record maker referred to is tho heifer Ida Lotta Winifred Burke, who freshened at four years and two days with second calf and on official test has 33.02 pounds butter from 604.5 pounds milk to her credit. She was bred by R. F. Guerin, Visalia and was sold in Mr. Guerin's 1917 sale. Owing to her unusual size and her general dairy quality she has always beon regarded as a candidate for a largo record. An outstandlng fact about this heifer is that she is a daughter of Winifred Hotaling, a cow that may now be rated as one of the great dams of the hreed. Winifred Hotaling now has five daughters with A. R. O. records as follows: Winifred Hotaling 2nd, 33.90 pounds hutter from 702.3 pounds milk in seven days, 874.12 pounds butter from 19,951 pounds milk in one year; Ida Lotta Winifred Burke, 33.02 pounds hutter from 604.5 pounds milk in seven days at four years; Winifred Hotaling 3d, 32.18 pounds butter from 575.1 pounds milk in seven days; Winifred Ora Belle, 26.28 pounds butter in seven days, a record recently completed and made out of three-quarters of an udder; and Winifred Richelleu, 16.99 pounds butter from 416.4 pounds milk in seven days at four and one-half years. Besldes this, one of the daughters, Winifred Hotalling 3d, is the dam of Eldorado Winlfred, Alex Whaley's great heifer that made over 25 pounds hutter ln seven days as a senior two year old, and thls year as a junlor four year old made 30.21 pounds hutter from 637.6 pounds milk in seven days. No other cow in the West has produced three daughters with records above 32 pounds hutter in seven days, and the famlly ranks exceptionally hlgh in individuality, registering another notahle instance where type and production are linked up strongly.

Participate in the Opportunity

of securing what is eagerly sought by practically ever breeder of Poland Chinas, desiring size, type, blood lines. Real type sows bred to such boars as Lendorris Liberty Bond, Young Jumbo and Liberator, offers you the opportunity of genuine herd improvement. Inquiries cheerfully answered.

Lendorris Ranch

W. L. Haag & Son **Hanford, Cal.**

Bred Sow Sale, March 13th, 1920

Smooth King

is a real Poland China boar—his name signifies just what he is, smooth—and a king. When I can't breed, raise and sell the right kind of Poland Chinas I will quit the business. This is one reason for my success. Pleased customers keep me in. Write me when you want good Poland Chinas.

Eugene Miner **Lodi, Cal.**

YOU ARE RIGHT

in demanding when you buy Poland Chinas, that they are correct in type—grow fast and are bred for prolificacy. Having bred this kind for years I could sell you no other kind. You invest for profit when you buy from me. Write for price and description.

J. H. Cook **Paradise, Cal.**

DON'T BE TOO LATE

Just a few of the prize winning Poland Chinas, that have been the sensations at this year's shows, remain unsold. I am not pricing them unreasonably and much less than you would pay in the east for animals not so good. Write me today what you want and I will send you full particuars.

J. F. LEHMAN **LODI, CAL.**

FRED GATEWOOD'S SALE OF POLAND CHINAS

Fred Gatewood held his Poland China sale in Fresno, Saturday, January 10. Thirty-seven head sold for a total of $3,430. Twenty-two hred sows and gilts sold for an average of approximately $123, while the summer plgs sold for from $40 to $100. The top of the sale was Blue Valley Susan by Blue Valley Tecumseh, going to Mrs. E. S. Meyers, Riverdale, for $410. W. L. Choisser of Riverdale paid $315 for Lady Sampson, while Hale I. Marsh, Modesto, secured five summer pigs by Giant Bob for $375.

The bred sows and gilts sold as follows:

2. M. J. MacPhee, Herndon, $105.
3. W. L. Choisser, Riverdale, $315.
4. Mrs. E. S. Meyers, Riverdale, $410.
5. H. I. Marsh, Modesto, $150.
6. C. J. Stevens, Herndon, $135.
8. O. E. Hollister, Goleta, $150.
9. Z. M. Dickey, Dinuba, $75.
10. H. I. Marsh, $95.
11. Z. M. Dickey, $85.
12. Les McCracken, Ripon, $65.
13. B. S. Cole, Hanford, $70.
15. F. C. Dollard, Ripon, $65.
16. H. A. Johansen, Fresno, $65.
17. A. J. Van Cleef, Riverdale, $85.
18. E. S. Meyers, Riverdale, $80.
19. E. S. Meyers, $70.
20. U. J. Clifton, Caruthers, $255
21. Z. M. Dickey, $60.
22. Z. M. Dickey, $60.
23. B. S. Cole, $70.
24. Z. M. Dickey, $85.

Extra—W. L. Choisser, $150.

SLIGHT DANGER IN RED SILAGE MOLD

C. H. Eckles, chief of the division of dairy husbandry at University Farm, says that inqulries are heing made concerning the presence of red spots in silage. This red color generally is found, he says, in lumps of silage from the size of a man's hand to half the size of a bucket. When the chunks are pulled open, some white mold is seen and some of the silage may be hright red in color. When thls red color is obserVed for the first time, it often causes alarm for fear the sllage will he lnjurious to stock. The color is produced by a mold and has been investigated rather carefully. No had effects were found when it was fed in large quantlties to animals. While it is always advisahle to discard moldy silage, says Mr. Eckles, no special fear need he felt of this red mold.

FORM POLAND CHINA SALE CIRCUIT

Owing to the unusual numher of public sales to be held this spring the hreeders have found it necessary to arrange, as far as possible, to have their sales fall in circuits. This plan has long been followed hy the hreeders of the Cornbelt and the fact that California breeders find such a plan necessary indicates the growth the purebred industry is enjoying in this state. One of the popular circuits has been designated as the Northern San Joaquln Valley Poland China circuit and includes the following sales: Geo. V. Beckman & Sons, Lodi, January 27, Hale I. Marsh, Modesto, January 28, and Les McCracken, Ripon, the 29th. The above sales will represent the initial individual sales to be held hy each of the breeders named and will include around 150 head of hred sows and gilts. A feature of the sale will be the large number of sows and gilts either sired hy or bred to hoars representing the more popular blood lines of the hreed. The Beckman sale, which will be the first this firm has staged, will offer a number of daughters of Matchless Big Boh.

Geo. V. Beckman & Sons, Lodi, Cal.

boar bred by the university and a grandson of Big Bob, generally rated as the greatest boar the breed has produced in years. For the most part they will be bred to Lakeside Defender, a son of Chief Defender's Choice. The Marsh sale will be fully up to the standard of that well known herd, and it will be remembered that this herd has been responsible for many of the greatest Polands seen in California showings. Les McCracken will feature the get of King's Big Bone Leader, the grand champion at the 1918 state fair, and Giant Bob 2d, the boars that are responsible for his great fall sale. It is expected that buyers will take full advantage such a circuit affords and attend all three sales.

REMEDY FOR PIG EATERS

A sow with the pig eating habit has been bothering a breeder who writes to the Missouri farmer: "I had four sows farrow the first days of September, and two of them ate all of their pigs, another eating two of her seven farrowed. They are in good condition, get a good feed of corn night and morning, also milk slop with shorts twice a day. It is too late to do me any good now, but can you suggest anything to prevent it in the future?" This trouble is more liable to occur when the sow has not been properly fed during pregnancy, says the Farmer. If she has had plenty of bone producing and growth making food during this period, she is much less apt to develop a tendency to eat her offspring, and the trouble is not often developed if the sow has been running on good succulent pasture. Some breeders practice watching the sow carefully at farrowing, and as soon as the afterbirth is passed, removing it and burning or burying it, claiming that if she is permitted to eat it, as she will usually do, it will stimulate in her a desire to eat her young. Others hold the contrary opinion, and even tempt the sow to eat the afterbirth on the presumption that it satisfies the meat craving of her appetite, but the general opinion is in favor of removing it from the sight and smell of the sow and destroying it. Prevention is better than cure, and a light dose or two of salts when signs of farrowing appear, green washy feeds and plenty of water constantly before the animals are all to be commended. Exercise is also valuable in keeping the prospective mother in good condition, but in spite of all some sows will develop the cannibalistic instinct. In such cases salt pork fed to the animal, two or three pounds if that much seems to be necessary to appease her meat appetite, will usually correct any pig eating desires. Plain salt pork cut in thin slices and fed one at a time until the sow seems satisfied, is about all that can be done, and it sometimes fails.

OVERFEEDING MAY CAUSE AZOTURIA

This is the season of year when the disease known as azoturia, and also popularly designated as "lumbago" and "black water," is apt to appear among horses, particularly those that are in good condition. The animals usually attacked are those that are well fed and, though accustomed to regular work, have remained idle for one or more days without corresponding reduction in rations. Among the first symptoms are a staggering of the hind parts and profuse perspiration. Usually the attack comes on suddenly soon after leaving the stable, though it may occur several hours after leaving the stable. After it has fallen the stricken animal may attempt to rise but will be unable to stand on its feet for any length of time.

Horses attacked with azoturia should be immediately freed from the harness and bedded to protect them from injury. Especial care should be taken to prevent bruising the head. A blanket should be thrown over the animal and then it should be removed on a wagon sled or sledge to a stable, preferably a well bedded box stall. Until the animal is able to stand it will be necessary to pass a catheter and draw the urine at least twice daily. Both treatment and nursing should be carried out under the direction of a skilled veterinarian.

While this disease has been attributed to various causes, veterinarians in the United States department of agriculture and other authorities incline to the belief that autointoxication is probably the cause. This theory seems to be confirmed by the fact that the development of the disease is favored by rich feeding and a period of idleness. In any event it is of especial value to know that the disease may be prevented with the greatest certainty by reducing the ration of grain when horses are not working and by exercising them daily.

LEGUME HAYS GOOD FOR BROOD SOWS

That clover and alfalfa hay are beneficial in rations for wintering brood sows is the conclusion of W. L. Robison, swine specialist at the Ohio experiment station. When fed to swine for this purpose, the alfalfa or clover hay is placed in wooden racks low down on the ground so that the animals may secure it easily.

Both clover and alfalfa have given satisfactory results when fed with corn to brood sows. The hay takes the place of a part of the more expensive grain ration, the common method being to give the animals a rather light ration of corn and plenty of hay and a little tankage. If no hay is fed, a somewhat larger amount of grain will be needed.

Brood sows on corn alone usually produce pigs of lighter weight and smaller bones, while those receiving hay and some tankage as a supplement to the corn produce strong, vigorous pigs with plenty of vitality. One satisfactory ration tried consisted of corn, 14 parts, tankage, one part, and what clover hay the animals cared for.

A recent tabulation of testing conducted by the division of animal industry of the state department of agriculture, of dairy herds supplying raw milk to Long Beach, shows that the number of reacting cattle has been reduced from seven to three per cent within a period of two years.

Corral Hollow, Alameda County, ranges report lambing proceeding favorably with best of weather conditions excepting that rains are needed for bettering the pasture.

A Sale of Unlimited Opportunities

Are you content, Mr. Breeder, to breed just average hogs? Are you content, Mr. Farmer, to raise just average hogs? The man who realizes his opportunities will be in attendance, will be a *buyer* at *this sale*

A Few of the Herd Improvers To Be Sold

Lady Massive bred to Col. Jack's Surprise, Massive Lady bred to McCune's Buster, Long Bell bred to King's Massive Orange, Rosebud Quality 1st bred to Col. Jack's Surprise, three by King's Big Bone Leader, two by Young Jumbo.

One gilt and one boar by Surprise Prospect out of Edith Rose, litter mates to the $1250 gilt sold in the Consignment Sale at Hanford in October.

Other blood lines represented in this sale: The Californian, The Yankee Jr., Lendorris Liberty Bond, King's County Buster, McCune's Buster, Giant Buster, Wondergerst and King's Massive Orange.

This certainly answers your question asto what sale offers you the greatest opportunities for the purchase of better Poland Chinas.

Mr. McCune Says:

In the sales held by the Kings County Poland China Breeders Association the animals I have consigned have met the hearty approbation of the buyers. In this, my first sale, I have selected only such animals as I thought would properly represent the great Poland China breed Those selling bred will be bred to King's Massive Orange, Col Jack's Surprise and McCune's Buster. A litter by either of these sires assures the purchaser something that will sell for real money. Every animal will sell strictly on its merits and commensurate with its value. I believe the sale will be worth attending and that everyone will find something worth taking home.

McCune's Big Type Poland China Sale
Hanford, Cal. Saturday, Jan, 24, 1920

The bred sows and gilts are bred to King's Massive Orange, one of the state's most popular sires; Col. Jack's Surprise, by Surprise Prospect, and McCune's Buster, by Giant Buster.

20 Spring pigs will sell and you will find they have plenty of stretch and bone.

You will find what you want in this sale.

Sale at 12.30 P. M. **Geo. W. Bell, Tulare, Auctioneer** *Lunch at 11.30 A.M.*

Dispersal of Choice Holsteins

Owned by

C. F. Mohnike, Angiola, Tulare, Cal.

(on the old DIXIE RANCH)

Friday, January 30, 1920

This is one of the most attractive looking herds we have ever sold. While no official testing has been done in the herd the blood lines are substantial, and buyers should secure excellent values on sale day. The herd contains

45 --- Registered Holstein Cows, Heifers and Bulls --- 45

20 --- High Grade Holstein Cows and Heifers ---20

The herd sire is CREAMCUP FIDESSA CORNUCOPIA LAD, who is by a son of the 33.53 pound cow Fidessa Bloom. His dam is Anselogess of Sleepy Hollow, 32.68 pounds butter in 7 days, 897.08 pounds butter from 22751.7 pounds milk in one year. His dam and sire's dam average 33.10 pounds butter in 7 days. He is a high class individual in every respect, his calves are of high quality, and he merits consideration from owners of good registered herds. He will be sold, together with 11 of his young daughters, and all bred females in the sale are in calf to him.

A daughter of Juliana King of Riverside, two grand daughters of Ignaro De Kol, a daughter of Anselmo, and a grand daughter of De Kol 2nd's Butter Boy 3d are among the females to be sold.

Besides the herd sire there are a number of young bulls that should find places at the head of high class dairy herds.

This herd as a whole is above the average in type, and the cattle are in good physical condition.

Every animal guaranteed to be a breeder; no animal tuberculin tested.

We will also sell 30 Poland China feeder hogs, two teams of good mares. and one new No. 17 De Laval separator with 1 h. p. motor.

Live Stock News Notes

Due to poor health, Chas. Gatewood, Fresno, is compelled to disperse his entire herd of Poland Chinas. Last spring Mr. Gatewood made an extensive trip through the Central West, purchasing a car of gilts with the view of mating them with Giant Bob. At that time he expected to remain in the business of breeding Poland Chinas and the purchases were made with the view of improving and strengthening his herd. Due to the reason stated every animal he owns, with the exception of a few young pigs, will be sold in his sale January 26. Mr. Gatewood states that in Prospector, by Long Prospect, and Gatewood's Prospect, by Wade's Prospect, he is selling two young boars that show every indication of becoming wonderful herd headers.

H. D. McCune, one of Kings County's foremost breeders and who has taken a prominent part in making that county noted for its Poland Chinas, will hold his first public sale in Hanford, January 24. In this sale Mr. McCune will sell 60 head, 40 bred sows and gilts and 20 spring pigs. In all probability no sale this year will offer a greater variety of blood lines than will this as practically every great sire in the state, as well as a number in the East, will be represented in this sale. In speaking of the sale Mr. McCune says that it is his desire to establish a standard for animals of his breeding and raising that will be second to none on the coast; further, that the sows selected for this sale have proven prolific and good mothers and the gilts are well grown, have plenty of stretch and bone. "I believe I am making a sale well worth attending and that the buyers will not be disappointed in the animals I am offering the sale."

In the public sale of Poland Chinas that will be held in Lodi, January 27, by Geo. V. Beckman and Sons the blood lines of the sows and gilts to be offered are attractive, due to the prominence on the coast of their various sires. Their herd boars are Matchless Big Bob, by Big Bob Orange 3rd, used so successfully at University Farm, Davis, and Lakeside Defender, a son of the Mehring boar Chief Defender's Choice. Mr. Beckman states that the animals selling bred will be bred to these two boars and that should be sufficient to attract a large number of buyers and he believes there is not an animal in the sale but what will prove entirely satisfactory to the purchaser.

The next Poland China sale by Les McCracken will be held on his farm one mile north of Ripon. The sale will be under cover and ample protection is afforded against bad weather. In the McCracken herd there is to be found something like 85 sows and gilts of breeding age from which he has made his selection of the 50 that will make up his sale offering. Mr. McCracken states that he is particularly anxious to have this sale come up to present day standards so has selected his offering with much care. He is making special effort to interest the farmers and dairymen of his community and would like to see the entire offering remain in his own neighborhood. That is the real object of holding the sale on the farm, and if he succeeds in making a few new breeders he will be perfectly satisfied.

W. F. Sandercock, Sacramento, owner of the Natomario herd of Berkshires, reports the death of his herd boar, Baron Duke 201st. Baron Duke was bred by N. H. Gentry, the noted breeder of Missouri. He first came into prominence when he was purchased by Frank Brush of Santa Rosa who showed him to the grand championship at the 1917 National Swine Show. When the Brush herd was closed out, Sandercock purchased Baron Duke and installed him at the head of his herd. Baron Duke sired a number of prize winners, including Natomas Baron Duke, grand champion at the 1919 state fair and the San Francisco Livestock Show. While the loss of such a valuable boar is great, Sandercock is fortunate in having a number of his best brood sows carrying the service of Baron Duke. Berkshire breeders regret that Mr. Sandercock finds it necessary to recall his sale planned for February 15.

V. F. Dolcini, June Acres Stock Farm, Davis, reports the sale of six Duroc-Jersey gilts to H. I. Bobb of Woodland. Five of the gilts were sired by June Acres Crimson Coi, first prize junior boar pig and reserve junior champion at the 1918 state fair and one is a half sister to that boar Ali are bred to Choice Wonder 3d, the son of Mahaska Wonder, now at the head of the June Acres herd.

W. A. Ward, member of the firm of Easton & Ward, owners of the famous Blackhawk Ranch, Diablo, was elected a director of the American Shire Horse Association at the last meeting of that organization. Mr. Ward is planning a trip to England this year and while abroad will probably select a number of Shorthorns to add to their already good herd.

Chester E. Hoyt, formerly with the United States department of agriculture, and well known to the dairy interests of this state through his work as judge at a number of milk exhibits, has been appointed chief of the dairy inspection service of the state bureau of animal husbandry.

R. M. Duniap, Sacramento, who recently brought out an extensive shipment of Shorthorn and Hereford bulls, expects to return East for another shipment as soon as possible.

February 12 has been selected by the Tulare County Duroc-Jersey Breeders Association as the date for their winter sale of bred sows and gilts. Forty head of bred sows and gilts will be sold and Allen Thompson, president, says that this offering will be by far the highest class of any they have yet made.

W. J. Higdon, Tulare, breeder of Holsteins and Duroc-Jerseys, has recently sold a boar and two gilts to Perry Dresser, Tulare. Mr. Higdon is consigning five bred gilts to the public sale of the Tulare County Duroc-Jersey Breeders sale, February 12.

C. E. Dack, one of Fresno County's prominent Poland China breeders, has recently secured from W. J. Graham, Howard Lake, Minnesota, two fall gilts by Black Price, the 1918 grand champion at the National Swine Show.

January 30, Ireland Ranch, in conjunction with Donald H. Graham and E. Avery Newton, will sell 40 bred Duroc-Jersey sows and 10 young service boars. The sale will be held on Ireland Ranch near Owensmouth, the property of Dr. M. Creamer. The prominence of these breeders, together with their herds, will, no doubt, attract a large number of buyers both from the ranks of the breeders and the farmers. In all probability no better blood lines will be offered this season as the entire offering is practically all Orion Cherry King and Defender breeding.

What should prove of particular interest to milk producers is the forthcoming sale by Burr farm of 100 head of high grade dairy cows and 20 pure bred bulls of all ages. It is rarely that the buyer of grade cows has the opportunity of knowing what he is getting when he makes such a purchase Every cow in this sale has been tested by the cow testing association and on sale day her complete record will be given before she is sold. About 50 are two and three year olds. Probably some of the best buys of the sale will be found in the dry heifers as most of them showed themselves heavy producers with their first calf. The bulls to be sold are all pure breds and include Veemoon, first prize bull calf at this year's Riverside show and third prize at Los Angeles. He is by Sir Veeman Korndyke Pontiac, whose two year old heifers are making exceptionally good records, and out of Doremoon, a 26 pound cow. As every bull calf on the farm is to be sold some excellent prospects can be secured. No douht this sale will hold many attractions for the milk producer desirous of knowing the productive value of the animals he purchases

A sale that should prove of much interest to Duroc-Jersey breeders is that of Winsor Ranch, Bonita, that will be held at Exposition Park, Los Angeles, January 29. In the past it has been practically necessary for breeders to send east for additions to their herds. It should be a source of satisfaction to them that they can now secure animals of the popular blood lines and true Duroc-Jersey type. Forty head will be sold ,and Mr. Walker, manager of Winsor Ranch, states that individually and in breeding they are the equal of those now being sold in the eastern sales. They have for their sires Great Orion Sensation, Great Wonder I Am, Great Wonder, Orion Sensation, Grand Model, Great Model, Top Sensation, Orion Fancy King, and Grand Model 8th. These will be bred to the present herd boars now on the ranch, Winsor's Giant Orion, claimed to be the largest Duroc-Jersey hoar on the Pacific Coast, and Great Sensation 3rd hy Great Sensation. In the owner's opinion such animals as will he sold cannot be distributed without materially changing the quality of the herds into which they will go. No doubt the offering will attract buyers over a wide range of territory.

Hale I. Marsh, who will hold a public sale January 28 of hred big type Poland China sows, takes the position that what has made other states agriculturally great will do the same for California. He is making a special effort to convince both the farmer and the milk producer of the necessity of breeding better livestock. The sale will consist of 35 head of bred sows and gilts, most of which are young sows having farrowed one litter. Mr. Marsh has been a consistent breeder of big type Polands and his show herds have been seen at the various shows for the past several years. The blood lines are easily recognized hy those familiar with present day Poland Chinas and some of the hetter herds of the state contain animals of his breeding. Mr. Marsh states that in selecting the animals for this sale he has paid particular attention to size, bone, type and conformation and that every animal to be sold will he well grown out. He is especially anxious to have as many farmers and dairymen attend his sale as possible. The sale will be held under cover on the farm six miles north of Modesto.

CATTLE PROTECTION

The office of cattle protection of the state department of agriculture caused several arrests and convictions for operating slaughtering establishments and slaughtering calves without first securing licenses to do so from the state as required by the Act of May 28, 1917. The department announces it will make vigorous prosecutions of all violations of the law, particularly in the using of unrecorded brands, and all inspectors throughout the state have been notified to inform of all such violations.

Farmers and Dairymen
Make More Money on the Farm

What has made Illinois and Iowa the two greatest agricultural states in the Union? Why have land values in these two states doubled and trebled in past few years? The reason is well known and it will do the same for California farms.
The day of the one crop farm is past. Today it is intensified farming that pays. The dairyman that is selling whole milk is not making his farm pay as much as he could.

What is the Answer?

Illinois and Iowa are our two largest producers of pork. The farmers and dairymen in these states have found the raising of hogs is very profitable. Pure bred hogs are the real money makers.

I wish to invite all the farmers and dairymen to attend my public sale.

35 Bred Poland China Sows and Gilts
Modesto, Cal., Wednesday, Jan. 28th, 1920

The day is here when pure bred hogs must take the place of the scrub. For years I have been breeding big type Poland Chinas and I have furnished foundation stock for some of our best herds today. The animals I am going to sell are mostly young, proven sows. You can select such blood lines as Major Hadley Wonder, Model Major, Young Jumbo, President, Big Knox, I. B. A. Wonder, Blue Valley Tecumseh, Cantrall's Ideal, Big Bone Bob, or Rosebud's Chief. These sows will be bred to Big Model, Modesto King and Blue Valley Big Bone. I am sure you will not be disappointed in the offering as I have carefully selected every animal and they are true representatives of the present standard of Poland Chinas.

To the Breeder Of special interest to breeders is the fact that I am placing in this sale some of the best sows I own. They are the right type, big boned, high backed and roomy and have proven prolific and excellent mothers. For instance I am selling *Knox Alice* by *Big Knox* which in itself should prove sufficiently attractive to bring every breeder in the state to this sale. There will be others like her.

The sale will be held on my farm 6 miles north of Modesto in my new sale pavilion. Lunch at 11 A. M. Sale starts promptly at 12:30 P. M.

Transport Trucks

"Always There All Ways"

With the cost of feed where it is today, can the rancher and the orchardist afford to continue using horses or mules, when it can be demonstrated that a modern truck will perform the same work more economically and in much less time? The animals must be fed whether they work or not, which condition does not apply to the truck.

The universal demand for foodstuffs of every character demands economical and rapid transportation facilities. Figures show that the agriculturist is realizing more and more each year the value of the truck in the transportation field.

Years of experience and one million dollars are back of the Transport, the most modern truck on the market. You cannot find better truck units than those combined in the Transport. They make for the most all-around efficiency.

It is our experience that the one-ton and the one and one-half ton models are generally the most adapted to the agriculturist's needs. They may be delivered with solid or pneumatic tires. We are always glad to confer with you regarding your needs.

WAR ON SQUIRRELS

Lorne S. Neville is in charge of rodent control for the Los Angeles County horticultural commission. Before this term of service he was in the same line of work for the state and travelled from San Diego to Siskiyou. A representative of the Cultivator recently accompanied Mr. Neville on an inspection trip to the fields. In the untreated fields were seen hundreds of colonies, sometimes a hundred in one large field of grain. Walking and driving over treated fields for several hours in a district where 4,000 holes were gassed, but 15 could be found where the squirrels were alive and had dug out. These holes were flagged with a short stick and piece of white cloth and in a few days will be visited by the workmen and given a double dose, which insures a territory free from squirrels.

Each man in the field was armed with a shovel and bucket of "dope." The shovels are known as "ladies' shovels" being short and light of handle with a small light blade, amply heavy enough for the work and not hurdensome to carry all day. Two gallon garbage buckets are used with a cover that fits on the outside, the cap rim two inches deep. These cans cost about one dollar each. They are easy to cover and uncover rapidly and little gas escapes as it is heavier than air.

Mr. Neville says that where a rancher opens the can but seldom, as when carrying it to the field while he works, and watches for an occasional squirrel, a tighter can could be used. There is one with a felt lined top rim such as is used in fireless cookers; also many cans with friction disk tops such as paints, some lards and other comodities are packed in. A gallon pail is ample for ranch use.

In the buckets are carried jute balls in a few inches of carbon bisulphide. Each ball will absorb about two ounces of the liquid. They are made at the state penitentiary at San Quentin from the waste from jute bag manufacture.

The workmen range across the fields sufficiently close to observe all squirrel holes. On freshly plowed fields of lumpy soil they must walk comparatively near each other and watch closely, for new holes are very hard to detect. In each such hole one saturated ball is thrown, the worker merely taking it in his hand, throwing it down in the hole as far as possible, chucking a clod into the throat of the passage, covering up with soil and treading on it to make it solid so no gas will escape. That is all; and the immediately subsequent funerals are unattended. Big holes, evidently the home of several, are given two saturated balls. One other method is used, especially in colonies. The balls are thrown in some of the holes, the latter left open, the workman passes on, comes back in five or ten minutes with a flaming ball on the end of a wire, thrusts it in each hole, there is a slight explosion and the hole is filled as before stated. In case smoke comes out of nearby holes these are closed and sometimes but one hole on a mound need be treated.

Buckets must be kept away from fire as the gas is highly explosive. The explosions are light and not at all dangerous, but it is as well for the operator to keep his nose away and to leeward for the gas is unhealthful. The county sells no buckets, but the dry balls may he had at county headquarters for $3.00 a sack of 800 and the carbon bisulphide at $5.00 for a five-gallon can. Keep the liquid away from fire, even lighted tobacco pipes, cigars or cigarettes.—E. B.

MANY PRODUCTS RECOVERED FROM KELP

Kelp apparently is going to be a profitable source of potash, an important fertilizer ingredient that the United States formerly obtained almost wholly from Germany. During the war an experimental kelp-potash plant was established by the United States department of agriculture at Summerland. Before the second year of operation was completed it had been determined not only that the plant could he mado self sustaining on the hasis of potash alone at $2.50 a unit, but that a number of valuable by-products could he profitahly obtained. The chief of the bureau of soils, which bureau operates the enterprise, estimates that if the plant turns out $300 worth of potassium chloride a day it may at the same time turn out $269 worth a day of the four principal by-products.

Among the by-products whose commercial obtainability has been established are iodine, common salt, ammonia and bleaching carbon. This hleaching carbon, formerly imported from Europe and sold for 20 cents a pound, has been prepared and sold from the Summerland plant at 15 cents a pound and appears at present about able to pay the production cost of itself and the potash, with good reason to helieve that it may ultimately be made to pay the operating cost of the entire enterprise. It has been definitely es tablished by large scale operations that very little of the nitrogen of kelp is lost in the various processes and that it can be commercially recovered as ammonia, thus yieiding another important fertilizer element. In this process enough combustible gas is released greatly to reduce if not to elim inate fuel consumption in the plant A tar is likewise recovered, and its subproducts, kelp oils and creosote, have been shown to he of value respectively as flotation agents and dis infectants. Still other valuable by products are likely to be recovered.

DAIRYMEN ON YOUR GUARD

Continued from Page 75

Furthermore, we take it that the attorney-general has thoroughly inves tigated the motives of the plaintiffs, and we assume that he was thoroughly convinced that the four named plaintiffs were willing to dig deep into their own pockets for the money nec essary to stage the pending legal battle for no other reason than a deep and sincere desire to reduce the cost of milk to the consumer.

We also assume that the attorney-general and divers and sundry metro politan papers and the plaintiffs to the pending suits have investigated the price of milk in other cities and are quite aware that the price to California consumers averages considerably helow that of most cities in other states.

But after all, perhaps the suits about to be hrought will prove hlessings in disguise. They will afford an opportunity for the dairy interests of this state to get the real facts governing their husiness into the records—if not into the daily press. They should serve to establish and make plain the costs of milk production. They should establish the fact that dairy products have not increased in proportion to other necessities. They should establish the fact, once and for all, that California dairymen are not profiteers: that they contemplate no menace to the welfare of the public; that all they ask is a fair return for their investment and lahor.

Furthermore, it is to he expected that the suits will also establish the real reason why the dairy interests have been singled out for prosecution, and just why certain parties have so magnamiously dedicated their time and money to the "cause" so consistently (and persistently).

We will also expect, shortly, that the self appointed guardians of the consumers' welfare will start jousting with the costs of other commodities—sugar, shoes and clothing, for instance, and that they will he equally as successful in enlisting the aid of the attorney-general as they have been in the case of milk.

The time has come when the dairymen and all other organized producers might just as well strip for a finish fight for their rights. From the first, the Cultivator has stood for and believed in the fundamental right of producers to organize and conduct their husiness at a profit, and we have felt that underneath the fight against the milk producers the real motive was to discourage and break down all cooperative effort. And we have felt that, should the battle go against the dairymen, other producers' organizations would he in line for the next attack. The time has come when all producers should go to the public with their problems. The public is fair minded once the facts are given, and the producers need to see that the facts furnished the public are true and that the public does not gain its views from the twisted, hand-made stuff originated hy those interests whose motives can be questioned

In the end a satisfactory adjustment will be made. Producers are certainly not expected to produce at a loss, but

Members of other cooperative associations stand behind the dairymen—else you may be next!

BLASTING GARDEN SOIL

It is to be hoped that everyone who plans to plant a garden next season will proceed without delay to blast the soil while it is dry. There are many reasons for doing so, and the objection that prevents many owners of larger acreage in farm crops from blasting, that of cost, should not apply to the few square rods that comprise the average garden plot. Fifty cents per square rod should be the limit of cost of the operation.

If the blasting is left off until next spring the chances are that the under soil will be too damp for successful breaking. An explosion acts in the ground much the same as any other cultivation. If the ground contains enough moisture to be plastic, it will pack; if it is dry enough to break apart and to crumble, it will become fine and loose. The sample for testing should come not from the surface, but from a depth of two or three feet, where the charges will be placed.

The benefits to be gained by breaking garden soil deeply are numerous and somewhat complicated to state. In the first place, the ground that is broken deeply will take water freely and will hold water in capillary form throughout dry weather. Compacted ground will do neither of these things. With an equal amount of rain or irrigation water broken ground will keep crops growing where unbroken ground will let them wilt.

The free movement of water both downward and upward tends to distribute fertilizing elements evenly all through the lower soil. When the ground is cultivated only on the surface the nitrates and other plant foods tend to gather just under the cultivated layer of soil, with the result that some roots are overfed while others are starving for the same elements. Big crops can be fed to maturity only by having plant food abundant throughout at least a couple of feet of soil.

There are other equally important results of breaking, which have to do with the physical structure of the soil. Without the breaking, followed by the introduction of roots deeper than usual into the ground, proper mellowing is almost impossible to secure. It is the decay of roots and other organic matter, helped along by the action of bacteria, which brings about the crumb-like structure of soil which means big yields.

In a garden the amount of work put on crops is many times greater than in a field. It is well, therefore, to let no link in the chain of proper care be lacking. To fertilize and cultivate and spray is not enough. The soil below the surface must receive its due share of attention.

TESTING ASIATIC GRASSES

Numerous grasses and legumes secured by botanical exploration in central Asia may disclose species that will solve the problem of range improvement on semi-arid lands, according to the bureau of plant industry, United States deaprtment of agriculture. There is a constant demand for grass that will increase the amount of feed above that which may be secured by rational grazing of the land under fences, and specialists of the department are undertaking a systematic testing of Asiatic grasses and legumes.

SOUTHLAND PEAT

While near Glendora recently we saw an orange orchard to which had been applied a dressing of peat from down Orange County way. The orchardist stated it is plowed and scraped out, dried, run over with a disk harrow several times and is then ready for use. It is purchased mainly for its humus which runs about 40 per cent. As a fertilizer it runs about 1.40 nitrogen; potash, .86, and .40 of phosphoric acid. The cost on track at Glendora is $8.80 a ton.

"I Knew Mohawks Were Good Before I Bought Mine"

That's what an automobile owner told us recently.

"Until I heard about Mohawks, I used to choose my tires with my eyes shut.

"I gambled on tires, because most people who tried to sell me tires told me things about them I didn't understand—secrets, mysterious sounding processes—all supposed to be the cause of better mileage.

"When my dealer started talking Mohawks, he had something tangible to say about them — logical, sensible and sincere reasons for their better quality.

"He told me they were made only of pure rubber — no 'fillers', no reclaimed rubber, no shoddy, rosin, glue. He said the fabric tires contained an extra ply of fabric in most sizes—a ply which Mohawk builders knew added longer life.

"He told me about the efficiency of the Mohawk Company, that Mohawk Tires are hand made, because they can be made more uniform and with longer wearing qualities that way.

"These reasons for Mohawk Quality were so sensible and sincere—so free from mere claims and mysteries—that I was convinced about Mohawks before I bought them."

Mohawks, both Cord and Fabric, in all standard sizes, and a hand-made Ford Size with an extra ply also. Good dealers everywhere handle them.

Mohawk Rubber Company, Akron, Ohio

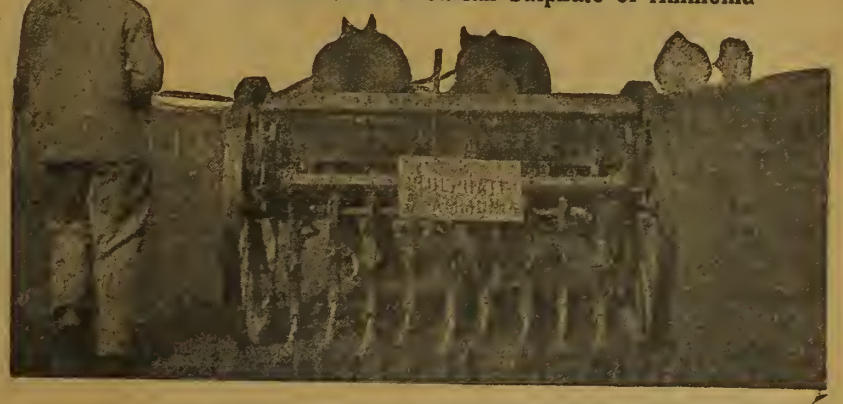
MOHAWK "Quality" HAND MADE TIRES

TOP DRESSING TALKS, No. 7
You can drill Arcadian Sulphate of Ammonia



Top-dress your field crops with Arcadian Sulphate of Ammonia, using the grain drill or fertilizer distributor.

When top-dressed with Arcadian Sulphate of Ammonia, the plants get an even start, maintain uniformly rapid growth and the whole crop ripens at one time. One hundred pounds per acre on California soils will usually increase the yields of grain from 5 to 10 bushels per acre, according to advice from the California Experiment Station.

ARCADIAN
Sulphate of Ammonia

Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past.

Arcadian is the kiln-dried and screened grade, made fine and dry for top dressing purposes. Ammonia 25¼ per cent guaranteed. Made in U. S. A.

For information as to application, write The Barrett Company Agricultural Department

510 First National Bank Building, Berkeley, Cal.

"Just like a hen —only better"

Biddy's temperature was always right, when she hatched the eggs—you never had to worry. But Biddy was an uncertain quantity in some other ways. Ordinary incubators require so much attention—night and day—then if a cold snap happens suddenly, and the eggs are chilled—or the flame, left unwatched, "runs up"—the whole hatch is lost. That's why poultrymen and farmers, and their wives, everywhere are blessing the

CHARTERS REGULATOR

(Readily attached to your Incubator. Part of the equipment of Charters Incubator.)

The Regulator watches over the hatch while you go to town—while you sleep—no matter if you are delayed, or if you forget. It keeps the flame at exactly the right size to produce the right temperature.

No matter how big, or how small your season's "hatch" may be—from one to one hundred machines or more—if they are Charters machines, you can count on a definite saving of time, worry and expensive loss. You need no incubator cellar with the Charters.

J. H. Stubbe, of Palo Alto, now using 66 Regulators and ordering 35 Charters Incubators, says: "We need not give the lamps any thought at night. The Regulator takes care of any change in temperature perfectly."

P. R. Lyding, of Sebastopol, with 26 years of Incubator experience, writes: "Your Incubators complete are absolutely the best I have ever used."

How they work:

It's the two thermostats that do the trick, actually anticipating any change of temperature outside—thus automatically adjusting the flame to meet the new conditions. The air outside may vary as much as 70 degrees, without affecting the egg chamber as much as half a degree. With the Charters you will need no incubator cellar.

The big tank, which holds a fuel supply that is capable of running the lamp from 2 to 3 weeks without refilling—is another feature of the Regulator. Only one refilling and one trimming of the wick a week. And the regulated flame saves fuel besides.

Write for our free catalog today, or send your order for your machine now, so we can deliver in time for your Fall hatch. The Regulator is $10; the Incubator (with Regulator attached) is $65.00. If it does not do what we claim for it—your money back.

See The Charters at principal fairs and poultry shows this year.

CHARTERS MANUFACTURING CO.

A "Going" Duck Ranch

By Jean A. Koethen

DUCK raising as an industry has lagged considerably behind the chicken business in Southern California, possibly because of the high cost of feed, partly perhaps, because the "green duck" market is comparatively new in Los Angeles. During the past two years, however, a number of good sized ranches have sprung up in the section near the coast, and a good many Pekins are raised for the purpose of supplying the growing green duck demand.

One of the largest of these ranches, that of J. W. Deyoe at Inglewood, was established two years ago. From a comparatively small beginning it has grown until now 600 breeders are kept and over 100,000 ducklings turned out yearly Every egg that is laid in the breeding season by the 500 breeding ducks is hatched and every duckling is sold for 35 cents to poultrymen and suburbanites. Last year the incubators turned out 50,000 ducklings, this year they will treble that number.

Contentment on a Duck Farm

The manager of the ranch, U. G. Lee, who has raised every duck on the place, laughed when I asked him how much it costs to feed a duck for six months. "It is costing us ten dollars a day just now to feed this bunch." he declared. "They are not laying yet, or at least only a few of the oldest are laying, but we have put them on their laying ration, and by January we shall have eggs enough to start the incubators. From January till June we expect a 90 per cent egg yield. Toward the end of July, after production has declined considerably and the green duck season is over, we put them on a maintenance ration and keep them on this ration of bran and greens till December, when we put them back on the laying ration.

Feeding for Eggs

The laying ration, which is given the breeders from December on, is mixed by the following fomula: 100 pounds wheat bran, 50 pounds low grade flour, 25 pounds alfalfa meal, 25 pounds corn meal, eight pounds beef scrap, one pint salt, one-half gallon charcoal (once a day). To this mixture is added, when the ducks are laying, about 15 pounds wheat and 15 pounds cracked corn or milo.

The mash is made crumbly moist with water and is fed in wide troughs which are never empty, for a laying duck, Mr. Deyoe believes, should eat whenever it wishes.

Water is kept before the ducks in galvanized iron tubs sunk in the ground, so that they may dip their heads as much as they like. If one occasionally gets into the tub no harm is done.

Mate One to Six

One drake for every six ducks insures fertility. The drakes should be about six months older than the ducks, therefore ducks of last winter's hatch, which are this season's breeders, are mated to drakes of the later spring hatches of the year before. Pekin ducks are good breeders for ten years and are in their prime from the second to the fourth year.

Shut Up at Night

As ducks that are allowed out at night make a good deal of noise, a good tight duck house that can be closed nights is a necessity. This one is 12 feet wide and 64 long and is divided by low wire fences into sections 16 feet wide Each section is extended into a yard 50 feet long, which is intended to accommodate 50 ducks, but at present twice that number are crowded into each yard A hinged door extends the entire length of the top and when closed at night makes the interior perfectly dark, a condition which makes for peace and quiet.

Feed for Ducklings

Ducklings that are raised for next year's breeders are fed the first three days on a mixture consisting of 20 pounds bran and 10 boiled eggs from the incubators. Eggs and bran are chopped together, and to the mixture is added an equal amount of clean sand. To this is added half a dozen heads of lettuce and the whole is made crumbly wet and kept in the troughs before the ducklings from morning till night. After the first week the egg is omitted and the mash mixture is changed to one-third corn meal and two-thirds bran. The green feed is no longer mixed with the mash but is thrown whole into the trough or on the ground.

The Pride of Petaluma

KRESKY'S 1920 VENTILATING brooder stove forces proper ventilation in spite of the operator and sweeps the room with FRESH AIR. PETALUMA'S latest sensation and result getter. TRY it. Keep it if you like it, or send it back if you do not.

Catalogue No. 3, free for asking.

KRESKY BROODER STOVE CO.

Petaluma Cal.

As soon as the drakes reach five pounds weight they are marketed as green ducks except thoso needed for breeders. Last year not less than 27 cents a pound was received for any duck sold from these yards, and in many cases the price was considerably highor.

Poultry Queries

Conducted by J. A. Koethen

Turkey Information

Will you kindly advise me where I can get information about the different breeds of turkeys, in raising for the market.—Subscriber.

"Poultry for Profit," published by the Cultivator, and sold for $1 per copy, gives full information regarding breeds and care of turkeys. An article on this subject will also soon appear in the Cultivator.

Mash Too Forcing

Have your book "Poultry for Profit" and consider it very good. Am also interested in reading your articles in the California Cultivator, which I find very instructive, as I am an amateur in the poultry business. Would you be kind enough to tell me what I can do for my White Leghorn chickens, three months old. They are dropping their feathers. Have been feeding them wheat in the mornings and evenings and a wet mash at noon consisting of: Forty pounds bran, ten pounds bone meal, ten pounds fish meal, ten pounds beef scraps, five pounds milo maize, five pounds corn meal, two pounds charcoal. Keep dry mash before them all day. Recently have changed from three to two feedings a day, cutting out the wet mash at noon, and am also feeding rolled barley along with the wheat mornings and evenings, giving them more barley than wheat. They are a fine bunch of chickens, unusually large and fine plumage. Have kept their house clean and they have no lice or mites. They preen themselves a great deal and then particles of scales drop and today I noticed one pick up a feather on the ground and eat it. They have a run of about one-half acre and had plenty of greens while small and for the last two weeks.—Subscriber, Arbuckle.

Your mash is too forcing. It contains 30 pounds of meat meals to 50 of grain, which makes the meat three-eighths, or 37½ per cent, of the whole. As a rule, from 20 to 25 per cent is all that should be fed to chicks, and 15 to 20 per cent is enough for laying hens. Many feed less. Better put them on a maintenance mash of 95 per cent bran and five per cent beef scrap for a month or six weeks so they will have a chance to develop frame and muscle before they begin to lay. You might examine the skin under their feathers for symptoms of favus, a skin disease which causes a sort of scaly crust to grow on portions of the body. If you find anything, rub the affected part with lard and sulphur, equal parts, well mixed. From the fact that your chickens appear so healthy and well grown, however, I think the trouble is in the feeding. When you give them the laying mash again after a month or more on the maintenance mash, make the proportion of ground grain larger. A good formula is: Three parts bran (by weight), two parts shorts, one part corn meal, one part barley meal, one part beef scrap, one-half part soy bean meal, one-half part oil cake meal, one-tenth part charcoal, five pounds salt to 900 pounds mash.

Fattening Chickens

Please give me the name of a book on the fattening and crate feeding of chickens.—Subscriber, Los Angeles.

Edward Brown, the English authority, has written a book entitled "Poultry Fattening" which covers crate feeding and construction also. "Poultry for Profit," the Cultivator book, goes into this subject quite fully, and Extension Bulletin No. 10 of the Purdue University department of agriculture extension, Purdue, Indiana, gives explicit directions for crate construction and a good formula for a fattening ration. Probably the University of California also issues a bulletin on this subject, but I do not remember seeing it.

HATCH EARLY

Early hatched chicks get a better start than late hatched chicks and are therefore stronger and better able to withstand the attacks of lice and disease. If you will notice a flock of growing chicks which are lice infested you will find that it is the smaller, weaker chicks which are suffering most. Observation will also show that the lice are more troublesome during the warm weather than during the cooler weather of early spring so that the chicks hatched early are not subjected to such severe attacks of lice while still very young as are the late hatched chicks. This of course does not mean that if the chicks are early hatched the lice should be neglected. By all means examine them for lice and, if found, take measures to free the chicks from the pests. It does mean, however, that not so much trouble from lice will be experienced and that they will be easier to control and will interfere less with the growth of the chicks.

WHAT DOES EARLY HATCHING MEAN?

Early hatching means chicks that are past the danger point before the hot weather sets in.

Early hatching means chicks less troubled by lice and disease.

Early hatching means more chicks raised.

Early hatching means a longer growing season.

Early hatching means better grown chicks.

Early hatching means higher prices for the surplus cockerels marketed as broilers.

Early hatching means well matured pullets which begin to lay in the fall.

Early hatching means eggs from the pullets while the hens are molting.

Early hatching means eggs in the fall and winter when prices are highest.

Early hatching means early maturing pullets that become broody earlier the following spring.

Early hatching means greater profit.

HANDLING AND PACKING EGGS

The recent conference of the International Egg and Poultry Instructors and Investigators held in London was attended by American Agricultural Trade Commissioner Edward A. Foley, who has forwarded the following report:

"The first subject under discussion was the new railway rule that each egg should be separately packed in its own compartment before the railways will accept the case for shipment at company's risk. This means that at the present time no eggs will be accepted at company's risk. Neither the American, Canadian, Danish nor Irish eggs are so packed as to bring them under the conditions of this rule.

"Danish eggs are placed in wood wool, Irish in straw, and American and Canadian in cardboard containers. The American container would be acceptable if each egg were wrapped in paper before being placed in its section in the container. A resolution was adopted protesting against this rule as impracticable and as imposing an unnecessary hardship on the shipper."

WATCH LICE ON YOUNG CHICKS

Powder the hen with a good insect powder before moving her and the chickens to the brood coop. The hen should be dusted every two weeks or as often as necessary until the chickens are weaned. If lice become thick on the chickens, or if they are troubled with "head lice," a very little grease, such as lard or vaseline, may be applied with the fingers on the head, neck, under the wings and around the vent. Great care should be taken, however, not to get too much grease on the chickens, as it will stop their growth and in some cases may prove fatal.

Champion Dependable Spark Plugs

Champion Dependability Has No Substitute

MORE than half of all the manufacturers building all types of gasoline engines, equip their products at their factory with Champion Dependable Spark Plugs. This is your guide and protection in selecting spark plugs for *your* car. There is a Champion Spark Plug for *every* type of motor car, motor truck, tractor, motorcycle and stationary engine. Avoid substitutes—look for the name "Champion" on the Insulator.

Champion A-44, ⅞-18
Price $1.00

Champion Spark Plug Company, Toledo, Ohio

WHEN you plan changing your methods of cultivation from a horse power to a machine power basis, you will of course give a great deal of thought to the selection of the right kind of tractor. The same careful consideration should be given to the selection of the right kind of harrow. The easy and safe solution is

Clark "CUTAWAY"

Double Action Tractor Harrow

Harrows that attach to every kind or size of tractor. The first tractor harrow in the field, and first in place, ever since. Whatever tractor you select there's a Clark Cutaway that will fit and do the work.

The disk harrow with special steel main frame that inflexibly holds each set of disks accurately in place. Digs deeper, pulverizes better, and pulls through the soil on less power. Saves time, labor and fuel—and helps produce bumper crops.

The disks in these harrows are forged, not merely rolled and ground, from toughest cutlery steel. They won't chip, crack, nor break like the ordinary run of disks.

Don't be influenced against "cutout" disks by manufacturers who are unable to produce an enduring "Cutout" disk of Clark Cutaway quality.

If your dealer can't supply you, some other nearby dealer will.

Write for free book, "The Soil and Its Tillage" and complete catalogue.

The Cutaway Harrow Co.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Planting Walnut Seeds

Am unable to secure walnut trees from nurserymen. Would it pay me to plant seed now? If so, should they be planted in nursery row or in orchard form? The place is in bands of renter so I would not be able to give the young seedlings the care they should have. What are the best seeds to use, the California Black or Eastern Black? I understand that the Northern California Black is better than the Southern. How should seed be planted and young trees cared for? Can I get nurserymen to come to the orchard and bud or graft the trees? What varieties are best, and should I make contract with nurserymen to do the work or would it be better to contract for buds with owners of trees that I know are good bearers?—Subscriber, Compton.

We would not under any circumstances plant seed in orchard form expecting to graft over trees when they reach proper size. The Northern California Black is generally preferred; the Eastern Black does not make such a vigorous tree. To answer as to seed planting and care in nursery calls for far more extended information than could be given in these columns. In merest outline: The nuts should be planted in the fall after they are gathered. They may be stratified and seed planted in nursery row after they have sprouted, or directly after gathering. They are allowed to grow one to two years, budded or grafted, staked, and after one or two years' growth of the bud they are set in orchard form. In this way uniformity of size is secured. Varieties best suited to your section are being developed and possibly becoming fewer so that by the time the subscriber's nuts are grown so that they are ready for grafting more definite information will be available. The Placentia, Eureka, Santa Barbara, Ehrhardt, Neff's Prolific are among those preferred for Southern California, while Concord, Mayette, Franquette, etc., are preferred in the northern part of the state. Under circumstances mentioned by the subscriber it would probably be best to contract with nurserymen to grow the trees.

Alfalfa Association

Is there more than one alfalfa growers association? If not, where is the present one located and does it have branches over the state?—Subscriber, Dunnigan.

We know of but one general association, the Alfalfa Growers of California and it has branches in various parts of the state. Its headquarters is in Los Angeles.

Pruning Tragedy's

Please give best method of pruning Tragedy prunes. Should young trees be topped or cut back?—Subscriber, Lindsay.

We would cut back young prune or plum trees for the first three years. However, there are others who do not believe in the cutting back. A general discussion of the subject, far too lengthy to appear in this column, may be had by writing the University of California, Berkeley, and asking for Agricultural Experiment Station Bulletin 313, "Pruning Young Deciduous Fruit Trees."

Pruning Young Vineyard

I have a young vineyard which has never been pruned and I am very anxious to give it the proper care and attention. Will you please publish an article on the pruning of grapes?—Subscriber, Arizona.

There is in preparation an article toucbing upon pruning of grapes which will appear in our columns within the next two or three weeks.

Apple Trees Bleeding

I have a number of eight year old apple trees. Three years ago some of the limbs were cut from the trunk and each winter and spring since they have bled. Can anything be done with the wood to stop the flow, or does it not injure the tree?—Subscriber, Beaumont.

We have never heard of wound bleeding so long as the ones you refer to which were cut three years since. Ordinarily there is no harm from this bleeding. Bailey's "Pruning Book" says: "Injury rarely follows bleeding." However, some claim that where the bleeding is allowed to run down on the bark of the tree it may cause external injury. We would try painting when the surface is entirely dry.

Minerals for Hogs

We often note you recommend the feeding of more mineral matter to hogs. In what form and what are the proportions?—Subscriber, Orland.

Generally the proportions of minerals are as follows: Charcoal, eight pounds; air-slacked lime, eight pounds; common salt, six pounds; hardwood ashes, eight pounds; powdered sulpbur, four pounds; powdered bluestone, two pounds. These should be thoroughly mixed and kept in stock so that a small supply may be before the hogs at all times. A low box makes a useful container. Such a mixture is especially cheap and will return big profits in the way of increased gains. It should be mentioned that this preparation is more of a tonic to keep the hogs in good condition than a safeguard against disease.

Persimmon Trees

I note in the issue of January reference to persimmons. Where can I buy these trees?—Subscriber, Hyne

We believe any nurseryman advertising in the Cultivator can supply you with these persimmon trees, that is unless they are all contracted for the season.

Gum of Deciduous Trees

Please tell me the reason for a gum coming out on the branches and trunks of my plum and peach trees which finally die. Is there anything I can do to prevent this?—Subscriber, Long Beach.

Exuding gum is difficult to handle. The trouble cannot be reached directly because it is simply the indication of some other tree trouble. We recently dug up a peach tree seriously infested and found the crown of the tree and many of its roots one mass of crown gall and root knot. This bad affected the health of the tree until its sap had been forced to exude and thus in evaporating left the gum. It is an indication that the tree is seriously out of health and one must look to the soil, and especially the roots or possibly to the weather conditions, for the real cause.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Homestead for Soldier

I have a son in the army who has

served more than three years and who has reenlisted for three years more. Can he take up a homestead and prove up on it without being obliged to stay on the land? Could someone take up a claim for him in Arizona or would he have to see the land and make entry himself?—Subscriber, Exeter.

According to the revised statutes of the United States anyone in the actual military or naval service of the United States who is desirous to take up public lands and by reason of his occupation in such service is unable to do the personal preliminary acts at the district land office, and whose family or some member thereof is residing upon the land which he is desirous of entering and upon which the bona fide settlement has been made may make the affidavit required by law before the officer commanding in the branch of the service in which such party is engaged; such affidavit shall then be filed by the wife or other representative of such party with the register of land office in the district wherein the land is situated, and thereupon becomes effective from the date of such filing. The time actually served, and if discharged upon account of wounds, then the time of enlistment is deducted from the time required to perfect title, except that a minimum residence of one year is required. In the case of such persons in the military or naval service, entry upon the land may be made by agent as well as in person. The widow of any such person is entitled to all of the benefits which such person would have had. Under this law in case of death of such entryman in the military or naval service, his services therein are to be construed as full performance of all of the duties required of him by way of cultivation or residence upon the land, and patent shall forthwith issue to his widow or other representative. The persons who have served in previous wars are allowed six months to locate and file their declaratory statement after making entry upon the land. The above provisions all apply to the homestead laws solely.

LEAKS IN GAS ENGINE

Under the caption "The Tractor is no Better than its Operator," the National Stockman and Farmer gives a fund of valuable information on tractor care. There are many leaks in the gas engine which cost a pretty penny. Here are some as noted in a recent article:

There are many places where the gas engine may leak. Too many tractor and automobile operators think of a leak as causing only a loss of gas on the compression stroke and losing power on the explosion stroke. While this is true, a leak will also cause a loss of power by allowing air to enter on the suction stroke. Too much air will result in a "lean" mixture which will not have the power that a correct mixture would have. In other words all of the air which enters the cylinder should go through the carburetor. A leak will cause other troubles than a loss of power; it will result in overheating of the metal adjacent to the leak. Along with overheating comes "pre-ignition" or "knocking" which will cause a loss of power and is extremely detrimental to the life of the motor.

Among the common causes of leaks in the tractor or other gas engines are: Spark plug leaking at the porcelain; spark plug may not be screwed in tightly enough; leaking at the valves; leaking by the piston rings; leaking at the gasket, etc. Many of the spark plugs on the market at present are constructed so that they may be taken apart. While this is an advantage in cleaning the plug it often gives trouble in leaking. Gas engine valves often give trouble in becoming pitted and will leak. This is true of the "exhaust valve" more often than with the intake valve. The intake valve is exposed to fresh, cool, clean gas and air mixture, while the exhaust valve is exposed to red hot gases and carbon, which has a tendency to make it rough, and pieces of carbon will often lodge under the valve and hold it open. As the temperature in the cylinder reaches to about 3,000 degrees Fahrenheit just at the time of the explosion it stands to reason that the flames rushing through the open valve will have a tendency to heat the valve to the point where it may sometimes melt. Of course such temperatures will cause pre-ignition which has been mentioned above. Pre-ignition is very hard on the motor and causes loss of power. As a great deal of the carbon in an engine often comes from poor oil it behooves every tractor operator and owner to use the best grade of oil.

Leaking by the piston rings results from two general causes: from worn piston rings or cylinder or too light oil or poor oil. There must be an oil film kept between the piston and the cylinder wall if leaking is to be prevented and, too, the oil film must be maintained to prevent excessive wear or sticking of the piston. The gasket between the cylinder block and the cylinder head often leaks. As a general rule oil will collect at the gasket when it is leaking. —J. J.

BETTER ROADS, MORE TRUCKS

Probably the announcement that the proposed expenditures in the United States for the next year for hard surfaced highways will be $633,000,000 as compared with the $125,000,000 of the closing year for the same purpose should mean more to the farmers of this country than to anyone else.

It is a significant fact that nearly 60 per cent of the trucks of the United States work in the country, though a large percentage of them may be housed in the city. About 20 per cent of them are actually owned by farmers.

The possibilities of the truck for carrying commodities between farms and cities have only been touched. The newer and better roads will give the impetus needed to bring out all its possibilities.

OUR FOREIGN TRADE

Phillip B. Kennedy, director of the bureau of foreign and domestic commerce, says: "The excess of American exports over imports has grown out of bounds. There is no question about the demand for American goods abroad. The United States is at present the world's principal producer. It is especially important that we face the general question of our export trade in a farsighted business manner. We have a big stake in the stability of world economic conditions. Our future as an exporting nation depends to a large degree upon our policy in the immediate crisis."

FOES TO THE GRASSHOPPER

Except for the strictly vegetarian dove and pigeon, birds of all families prey upon grasshoppers. Among those especially destructive of grasshoppers may be mentioned the bobwhite, prairie chicken, screech owl, nighthawk, red headed woodpecker, crow, magpie, red winged blackbird, meadowlark and robin. Domestic fowls are also very fond of them and will feed so greedily upon them that in the case of turkeys death is frequently caused by lacerations of their crops due to the roughness of these insects' hind legs.

The "K. K. Company" of Japanese has been organized for the purpose of conducting fruit and vegetable growing and a general agricultural business.

BIG SEED COMPANY NOW DISTRIBUTING NEW CATALOG

Aggeler & Musser Seed Company of Los Angeles Issues 27th Annual Book Finest Yet Published

The largest seed company in Western America is now distributing broadcast its 1920 seed catalog. The big Annual will exceed all previous ones and it is said is a complete course in agriculture, with several hundred interesting illustrations.

There is something of interest to the Home Seeker, the Stockman, Dairyman, Rancher, Orchardist, Poultryman and Gardener, for there are departments on Home, School, Field and Demonstration, Garden Work, Moro and Better Potatoes, correct tools and implements to use for best results. Marketing notes on each subject, telling how and where to market. Hints on poultry, spraying, fertilizing and the use of insecticides. The whole book of 112 pages is most interesting, entertaining and instructive—in reality it is several books in one, for it includes the important "Garden Manual." Over 1000 questions are answered.

The catalog is absolutely free, and should you have not already received it, write immediately to the Aggler & Mueser Seed Company, 620 South Spring Street, Los Angeles, California. Its city store is in the center of the shopping district and its location is a great convenience to rural customers. There is a special "Call" Department to accommodate customers in town for a short time on business. Orders left on arriving are ready when called for. The big Mail Order Department and General Offices are situated at the city store, while the General Milling, Cleaning and Warehousing is situated at the big Warehouse at Sixth and Alameda. Be sure to secure a copy at once. Write today.

We Supply Every SPRAYING DEMAND

Bean Roller Power Sprayer

Manufactured by Bean Spray Pump Co. in their Lansing, Michigan factory for service in the sand dunes of Florida.

North, east, south, west—in this country or across the seas—

BEAN Power Sprayers are, each season, adding to an already favorable International reputation.

To build sprayers as good as they can be built and in construction and principle adapted to the specific needs of growers in certain sections is our aim, and in practice our accomplishment.

We have a sprayer for every need and in these days no grower can afford to grow fruit without Bean Equipping his orchard.

Write for our catalog today, describing the Bean line. It includes our new Simplicity outfit. If you have five acres or fifty you need a Bean sprayer. If your orchard is in South Africa or California there is a Bean fitted to your particular needs.

LOVING A GROUCH AWAY

There's a look on the face you can love away,
There's a crease in the brow you can smooth today;
There's a gleam in the eye you can change to one
That is sweet as the ray of the morning sun—
It's the touch of our loving, the sweet of our will,
That scatter the shadows of anger and ill.

There's a grouch that you think will be always the same,
So grim and so dark; but it goes as it came
When you love it away with a tenderness born
Of the spirit of brightness and gladness and morn—
There isn't a grouch ever lived very long
'Neath the spell of a love that is sweetened with song.

You can love it away, love the ache and the care,
Love the heart that is heavy with grief and despair,
Till it lifts to the sunshine, as flowers in the spring,
And responds every time to the song that you sing—
Forgetting its wrinkles and creases and frown
At the touch of love's fingers like velvet or down.—Baltimore Sun.

THE DESERT FEUD

By M. E. Bemis

IT was one of those gloomy, rainy days in early November. A rainy November day is always gloomy anywhere, but in Arizona, where rainy days are of rare occurrence, the gloom seems all the greater. The lobby of the Arizona Club was almost deserted. A few had drifted in for lunch, but most of them had left without the customary after-lunch chat. In an effort to dispel in a measure the general gloom, the manager had ordered a fire in the open fireplace.

Before this fire sat old Hendricks, apparently half asleep. The old man was one of the "old timers," who had come into the country in the early days, had made a fortune from lands and cattle, and, later on as the years rolled by, he had added to it. A man of means so far as money and property is concerned, he prided himself more on his wealth of friends among young and old, rich as well as poor.

Lounging about the room were Dawson, Langley and Paxton. Each wore an expression that was like the weather, though the weather was not alone the cause, but served to intensify the feeling that inspired the expression. The morning had been spent in the performance of a sad duty. A child of Frank Lambrite, one of the best loved members of the club, had that morning been laid away to its last resting place—a little girl that was the light of Lambrite's life, who had bade him good-by when he went away with the first contingent, gleefully promising to be "dood" while he was gone. And Lambrite was "somewhere in France." Later we were to know that at that very moment he was in the hell of the Argonne forest in those last days before the armistice, and alas, the last of all days for many!

In subdued tones the three were discussing the sad event and pitying the father who must come back to a saddened home. Dawson had come back from the front himself with a touch of gas; Langley had heart trouble, so half a dozen doctors had told him, and he had had as many disappointments in trying to get into as many different branches of army, navy and Red Cross service; Paxton was poor, and with his family it was impossible to go, yet each had a separate longing to be there at the front with Lambrite, and especially so this gloomy day. Each in his way was railing at fate, the weather and the hardships of the world. Hendricks still sat apparently asleep, although occasional wreaths of smoke from the cigar between his teeth showed that he was awake or that force of habit enabled him to keep the cigar alight and doze. Paxton impatiently glanced his way and finally said: "Funerals, rain and war—it is all the same to old man Hendricks. I wonder if he can realize just what this is going to mean to Lambrite?" The three continued to talk in low tones for some minutes, and then the old man stirred, gathered his big hulk, sat up straight, and looking over toward the three, said: "You boys think you know something of the sad things of life, and I agree with you that today's funeral was sad enough for most mortals. I have seen many funerals in my time. However, as I look back there is one that stands out in my memory so unutterably sad as to be never forgotten and yet that was not without its compensation after all."

The trio sensed one of Hendricks' infrequent stories of the days when Arizona was new, and crowded closer. The old man was in no hurry to begin. "This is the story of a funeral," he said, "and not calculated to make the day seem much more cheerful or mitigate much the sorrow that you feel for Lambrite and for Lambrite's wife, but it may help a little to know that there have been sadder occasions than that which you have today had brought home so vividly.

"There was a time when I was not known as Old Man Hendricks." Paxton blushed, looked a little foolish and the old man continued: I may have told you before, I was an orphan at the close of the Civil War and made a living shining shoes and selling papers on the streets of Louisville. One day a few years after the troops were mustered out, and about the time when I was 12 or 13 years old and beginning to feel that I was getting big enough to get a regular job, a man of about 25, with an unmistakable military bearing and a personality that impressed me from the first morning that I shined his shoes and sold him the Courier, accosted me with the remark:

"Young man, I have been watching you for several days."

"Yes, sir," I said; "I have been shining your shoes regularly now for just a week."

He seemed pleased, and continuing, said:

"I believe you are just the sort of boy that I want. Do you like horses?"

"I like to look at 'em," I answered, "but I ain't never handled 'em none; but I guess maybe I could. I'd sure like to try."

Well, the upshot of the conversation was that I chucked my blacking kit and bundle of papers and went with John Brent to the livery stable where he bad a half dozen Kentucky thoroughbreds. I found out that he was planning to take them into the ranges of Arizona, his idea being to begin the breeding of fine saddle horses for the range. He had been selecting these for this purpose and with especial care, and was ready to start for San Antonio to connect with some train of settlers that would travel overland by the way of the stage line route now more often known as the Borderland Trail, across the dangerous Apache country into California.

As I said, this man, John Brent, was a man of impressive personality, tall, blond almost to the point of being red-headed, with keen blue eyes that could look holes through a human being, a jaw that was typical of firmness, broad shoulders and muscular limbs, all characteristics that impressed the casual observer and combined to give the impression of one who would be expected to have his way, right or wrong, whom women would be inclined to swear was right, and men, unless they were looking for a quarrel, to concede those rights with as little argument as possible. His voice was rather pleasant, but still incisive and that of one used to commanding others as well as having his commands obeyed pronto.

I learned, not from him, but from others later, that he had been a captain in the Union army. When mustered out he had laid aside his uniform and his title at the same time and gone back into civil life with only the memory of his military days, refusing to answer to the name of Captain Brent.

It is not now strange that to me John Brent was the greatest man that ever lived, for he was the greatest man who had ever come into my life. He said but little, but when he did speak it was to talk to me as an equal, and his instruction in handling horses was given in a kindly way, and not as that of a master to a servant.

We embarked by boat at Louisville and came down the Ohio to the Mississippi and then to New Orleans where the overland journey to San Antonio was begun. At New Orleans

The Cultivator Patterns

BE SURE TO SEND SIZE

3107—**A Smart Gown.** Cut in six sizes: 34, 36, 38, 40, 42, and 44 inches bust measure. Size 38 will require 5¾ yards of 44 inch material. Width of skirt at lower edge is about 1⅝ yards. Price 10 cents.

2752—**Girl's Dress.** Cut in 4 sizes: 6, 8, 10 and 12 years. It requires 1 yard of lining 36 inches wide for the underwaist, and 3 yards of material for the dress, for an 8 year size. Price 10 cents.

3122—**A Simple Apron.** Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. Size Medium will require 4⅝ yards of 36 inch material. Price 10 cents.

3121—**Child's Dress with Bloomers.** Cut in 3 sizes: 4, 6, 8 and 10 years. Size 8 will require 3¼ yards of 36 inch material for the dress, and 1¼ yards for the bloomers. Price 10 cents.

3101—**Attractive Modsi for Slender Figure.** Cut in 3 sizes: 16, 18 and 20 years. Size 18 will require 5⅜ yard of 36 inch material with 3 yards of ribbon or matsrial 5 inches wide for the sash. Width of skirt at lower edge is 1 yards. Price 10 cents.

3096—**Girl's Dress.** Cut in 4 sizes: 4, 6, 8 and 10 years. Size 10 will require 3⅛ yards of 36 inch material. Price 10 cents.

3094—**Dress for Work or Leisure.** Cut in 5 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 requires 6⅛ yards of 36 inch material. Width of skirt at lower edge is about 2¼ yards. Price 10 cents.

3103—**Boy's Suit.** Cut in 4 sizes, 2, 3, 4 and 5 years. Size 4 will require 2⅜ yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest Chicago styles, all pattern orders are filled in Chicago. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
California Cultivator
Los Angeles.

Brent bought a six shooter for me and strapped on my waist, with the remark:

"We are going into a land of Indians and gun men where the law is the law of the bullet and the verdict of the court goes to the man who shoots first and straightest."

At San Antonio we joined a train of travelers all bent upon going into that little known western country where fortunes awaited some and death stalked for others. Few were undertaking the venture without knowing the dangers, but like the throw of dice, each hoped his lucky number would be up. In all, I suppose there were 20 wagons drawn mostly by mules. Some of the pioneers were driving through cattle to form the nucleus of herds for the great ranges that were then new and rich with grass.

It was a motley crowd, representing many different classes and from many sections of the country. Brent was from New England originally. There were several others from the eastern United States, a number from the south, whose fortunes had been lost in the great struggle between the states, and who hoped to make good again in a new country.

Among the latter class the most conspicuous was Major Andrews and his daughter Mary. Very little was left to them of what had once been the wealth of a big Mississippi plantation; little except the pride which to those fine old Southern families was last to go. Mary Andrews was a girl of the protected, clinging type, possibly 22 years old. All through the horrors of the war an aunt (her mother died when Mary was but a child) and some faithful slaves had stood between her and want, sorrow and suffering. Of real life, of the work that is necessary to one who must fight his own way, of the real troubles of the world she knew as little as the canary that is petted and fed all its life in a cage, and so far as being of any use to herself or others was concerned, she was as helpless as the canary bird would be if turned loose in the wilderness. Notwithstanding, Mary Andrews was an extremely attractive girl. Her raven black hair, flashing black eyes, with rosy cheeks and red lips her lithe slender figure, tall and straight as an Indian princess, would have made her the admired center of a crowd even in a fashionable ballroom of beauties. Added to her physical charms was a winsomeness of manner, a soft drawling voice that reminded one of shaded nooks in the gardens of the old Southern mansions, of the odor of magnolias and the song of mocking birds. As the ballroom belle she was a queen of queens, but for a pioneer woman, fitted to endure the hardships, perform the work and stand the exposure of the outdoor life, she was as little fitted as the hothouse plant is to stand the rigors of a winter in Alaska. Yet these characteristics, if I may call them so, were not by any means the result of a vicious temperament. Quite the reverse, for a kindlier heart never beat in any girl's breast. She was simply the product of environment, and she herself was no more to blame for her bringing up than is the canary that has never known any world other than the wires of its cage. The great work-a-day-world was from her shut out. Dormant somewhere in her being was the instinct of ancestors that had struggled and worked as most human beings have to work, but as yet all was as foreign as the habits and customs of the inhabitants of the interior of Australia. Could and would some cataclysm wake that instinct to life? We were destined to see.

(Continued next week)

THIS WEEK'S PATTERNS

The long lines of 3107 are particularly good for a stout figure as they add to the apparent height and take away from the apparent width. Be sure to bring the collar up high in the back—if you are inclined to be stout or your neck is not as young as it used to be. The braiding on vest, waist and overskirt is simple and adds immensely to the attractiveness of the costume. A similar simple design in outline, using heavy rope silk, is a little newer than the braiding. This dress would be good in any wool, silk or plain heavy cotton material. In white wool with black embroidery it would be beautiful for any occasion, simple enough for any, distinguished enough for any. Then if it is good material it can be washed in soap and water, ironed and be as good as new and look vastly better than if sent to the cleaner or cleaned at home with gasoline.

A charming dress for daughter is 3101, also showing the decorative possibilities of a bit of simple embroidery. The soft drapery at sides of skirt is very up to date and the soft butterfly bow at the back is charmingly graceful for a slender girlish figure. A soft material in silk or wool should be used.

A pretty spring or summer dress for the small girl is shown in 2752. Can't you just see it in a white lawn or dainty flowered dimity? A nice school dress is 3096. The yoke and front pleat afford suggestions for making larger an outgrown dress that still has wear left in it.

Another attractive apron and house dress are shown. You will agree with us that we specialize in attractive aprons and house dresses. Note the little design at lower left of the apron 3122. Looks quick and easy to make, doesn't it, and could anything be more graceful than the long simple lines. Another good feature is the placing of the pockets toward the front instead of the side of the apron. If you are like the writer—always going through doors with a rush—you have frequently had the experience of catching big side pockets on the door knob or key of some other projection and ripping or tearing. To such housekeepers this pocket will appeal strongly.

A practical and pretty child's dress with rompers to match is shown in 3121. This and the boy's suit 3103 would be pretty and would wear and wash well if made in any of the heavy cotton weaves called romper cloth, kiddie cloth, Devonshire, etc., to which we refer almost every week. It seems to us at present prices the most satisfactory material for wash dresses for children—and grown-ups too for that matter. The writer has just had made a plain one-piece dress in plain color navy blue Devonshire of which she is exceedingly proud for it looks as if it would wear and wash well.—R. P. D.

GOOD FOR COLD WEATHER

Baked Pumpkin

The very simplest method of preparing squash or pumpkin is to cut into three inch squares without removing the rind, place the rind side down in a baking pan and bake until soft in a moderate oven. Served with salt, pepper and butter this is delicious.

Mashed Pumpkin

Force the steamed pumpkin through a colander. Season with salt, pepper and butter. Serve hot.

Pumpkin Corn Bread

(An old fashioned favorite.) One cup mashed pumpkin, one cup cornmeal, one-fourth cup flour, one egg, four teaspoons baking powder, one teaspoon salt, two tablespoons melted fat. Mix in order given. Pour in greased baking pan and bake 40 minutes in a hot oven. Cut in squares and serve hot.

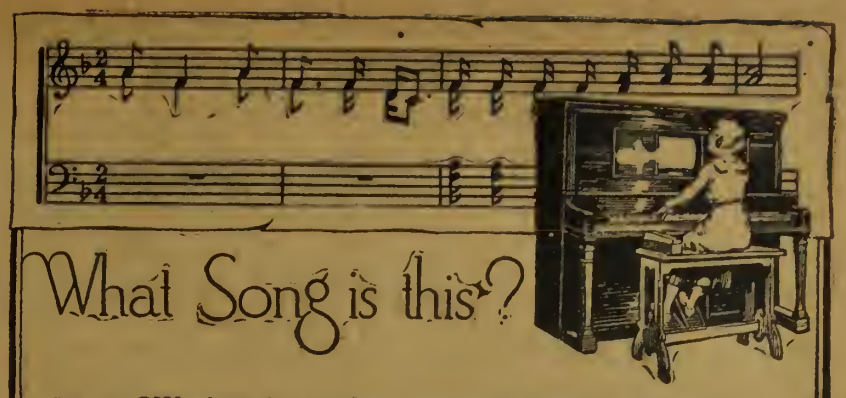
Pumpkin Bread Pudding

One cup stale bread crumbs, one and one-fourth cups sweet milk, one cup mashed pumpkin (boiled or steamed and put through a colander), one-third cup sugar, one-half teaspoon salt, one teaspoon vanilla, two egg yolks, one tablespoon butter (melted).

Pour the milk over the bread and allow it to stand until the crumbs soften. Add pumpkin that has been cooked and put through a colander before measuring. Add the egg yolks and melted butter. Beat well. Pour into buttered baking dish and bake in a moderate oven until the center is firm. Remove from the oven, spread the top with a tart jelly, pile meringue lightly on top and return to oven long enough to brown the meringue. Serve cold with cream. If preferred, the jelly can be omitted and the pudding is good even if you do not serve cream with it.

Meringue: Two egg whites beaten very stiff, four tablespoons sugar, a pinch of salt and one-half teaspoon vanilla.

Old hot water bottles or other rubber objects make fine mats to put under the saucers of flower pots.



What Song is this?

HOW often do you hear melodies that are familiar, and yet you do not know what they are! Our book, "Songs of Long Ago", contains the complete words and music of 26 of the most popular old time songs and ballads. We will send you this 32-page song book free. Simply fill out the coupon below and mail it to us.

Baldwin

A Name that Stands for Real Worth in
PIANOS AND PLAYER PIANOS

There are many things that have helped make Baldwin-built Pianos the standard the country over. First, is our policy to produce only high-grade instruments. Second, is our two completely equipped factory groups and experienced organizations of piano builders in Cincinnati and Chicago. Third, is the tremendous demand for our instruments which enables us to buy the choicest materials at the lowest prices. Fourth, is our selling method which eliminates jobbers' and wholesalers' profits. The Baldwin line includes the Baldwin, Ellington, Hamilton and Howard Pianos—and the Manualo, "the player-piano that is all but human." **Send for Book to Dept. A1**

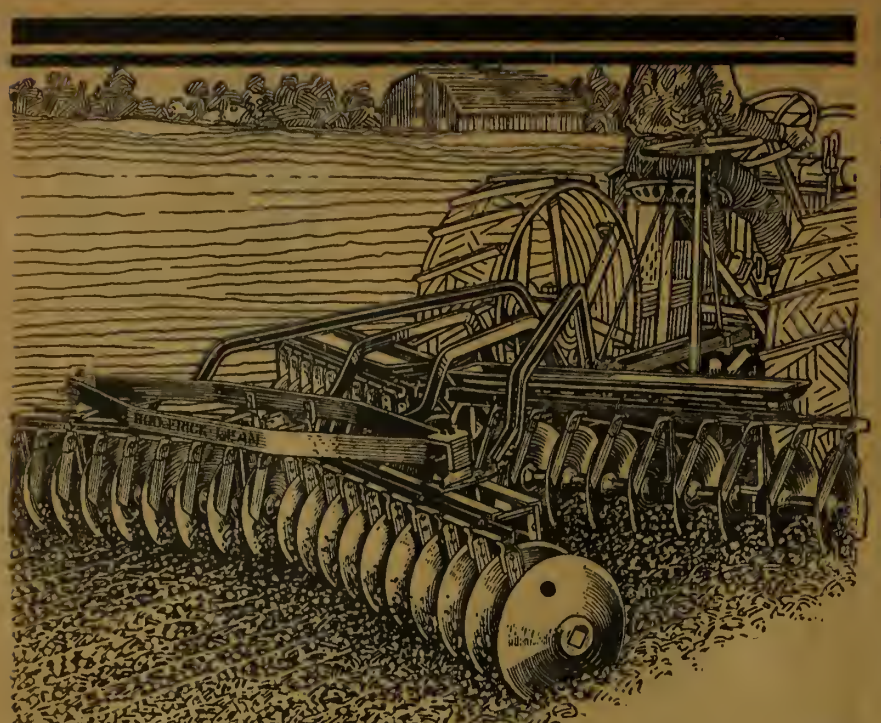
The Cultivator Costs Only $1.00 Per Year



"All Business"

THAT'S what they say of men or or machines that do their work and do it well---always!

The Roderick Lean Automatic Engine Disc is certainly such a machine. Specially designed and built for tractor use, the way it puts your fields in prime shape for planting with a single once-over---*it surely is "all business."*

The gangs of this disc are automatically angled by draft of the tractor. Regulating wheel within close reach of tractor seat allows quick and easy adjustment without stopping. A one-man outfit, built as only Roderick Lean knows how to build real farm tools.

This disc is built in eight, nine and ten foot sizes with sixteen or eighteen inch discs. Flexible for short turning, strong for power requirements and long service. Cuts out the tracks of big tractors.

Dealers everywhere are selling this disc. See the Roderick Lean dealer in your town, or write direct for full information.

Spring Tooth Harrow

Has heavy, one-piece angle steel frame with extra runner plates to prevent wear, long spring teeth of special steel, and special adjustable tooth fastening device. Good clearance and light draft.

Steel Lever Spike Harrow

The first steel spike tooth harrow ever built, and the best known and most widely imitated. Every ounce of special steel. Every section surrounded by strong channel steel frame, braced at two corners and center. Cannot twist.

"New Century" Single Disc

Furnished in any size from 4 to 10 feet. Strongly built and braced. Has working features not found on other single discs. Flexible trailer can be furnished in 5, 6, 7, and 8 ft. sizes.

"New Century" Engine Disc

Furnished in 5, 6, 7, and 8 ft. sizes for use with lighter tractors. Built extra strong for power use. Operated from tractor seat by two levers within convenient reach. Adjustable hitch suits any standard light tractor.

Roderick Lean Mfg. Co.

Builders of the most varied line of harrows in the world, including a complete line of spike and spring tooth harrows

The Poultry Breeders' Show at Los Angeles

By Jean A. Koethen

THE first Los Angeles Mid-Winter show I attended was held in a big tent in Fiesta Park. It was a great event, and the tent was thronged with farmers and poultrymen from all over the Southland. That was about ten years ago. The next year the show moved farther down town into the old post office building at Seventh and Grand. That year 5,000 birds, including pigeons, were said to be on exhibition. Then it moved down into the big store building at Tenth and Main, and filled, I remember, at least two stories of that big floor area. Now for some years it has been held on Broadway, and this year was crowded into the third and fourth floors of an inconspicuous building, with only the cloth sign and a brooder full of shivering chicks to indicate that a show was in progress. The seeker for blue ribbon poultry had to pick his way around corners and up a winding stair, or else ring for the elevator. Once found, it turned out to be a pretty good show, but it was not easy to find and was hardly a third as big as that memorable show in the old post office building ten years ago.

What has wrought the change? Is interest in pure bred poultry on the wane? Are there fewer fanciers? Are we to chronicle presently the decline and fall of the fancy? No, a thousand times no! There has never been a time when interest in poultry, both utility and fancy, was so keen, when so many people of all walks of life and in city and country alike were turning their thoughts to poultry production or breeding. It would seem the psychological moment for a big drive for better poultry and the inauguration of a Midwinter Show on a larger scale than has hitherto been attempted.

This is no criticism of the Poultry Breeders, I know nothing whatever of the differences of opinion which have led to the organization of a rival association and the holding of two shows instead of one. I only know that this dividing into separate camps is working an injury to the whole poultry industry in Southern California, and especially to the fancy. This having to attend two shows is hard on the breeder, who must perforce enter his birds twice, paying a double entry fee, and hard on the public, which is obliged to pay two quarters to see two small shows, instead of paying one quarter and seeing one big show that the whole community can be proud of. A few of the big breeders take the birds to only one of the two shows, but the little fellows and some of the big ones—and most of the novices, must, to be in the procession, enter their birds at both. Consequently the Poultry Breeders was to a considerable extent a duplication of the Los Angeles show in December, except that there were fewer entries and a less favorable place for showing.

What a splendid thing it would be if all the fanciers in both camps could compromise their differences and build a really suitable building for their shows in a really suitable place! Smaller towns than Los Angeles have done it, and the growth of the poultry industry in Southern California demands it.

Dark Cornish Prominent

In this show Rhode Islands Reds led in number as usual, but Dark Cornish came to the front amazingly. The second floor was nearly filled with this handsome breed, nearly 100 birds being on exhibition. First cockerel, a magnificent bird from Redondo weighing 12 pounds, attracted a great deal of attention.

Wyandottes also made an unusual showing, not only because of the large number and splendid quality of the Whites, but because of the number of other varieties entered. There were some fine Buffs and several each of Columbian, Partridge and Gold and Silver Laced.

Rhode Island Whites were more numerous than ever. These beautiful birds are certainly gaining in popularity, and their reputation as layers is second only to that of the White Leghorn.

The Pit Game is comparatively new on the coast, and the 21 birds exhibited were quite a curiosity because of their diverse coloring. Although all classified as just "Pit Games," some were yellow, some brown, and some gray. Some of the hens resembled the Buttercup and some the Brown Leghorn, and the most noticeable male was a notable combination of yellow and gray.

The number of breeds shown was greater than usual, including Andalusians, Campines, Buttercups, Pit Games, Dark Cornish Games, White Cornish, Golden Gates, Bluettes, Black Minorcas, Buff Minorcas, Buff and White and Blue Orpingtons, Anconas, Houdans, Rhode Island Reds and Whites, both Single and Rose Comb, White, Buff and Brown Leghorns, Light Brahmas, six varieties of Wyandottes, Buff and White and Barred Rocks, Black Langshans, R. C. R. I Whites and 12 varieties of bantams.

Muscovy Ducks, Toulouse Geese and Bronze turkeys completed the list of domestic fowl and rounded out a very interesting display of fine stock.

The judging was by two Eastern men, O. L. McCord of Peoria, Illinois and Erle Smiley of Beaver Crossing, Nebraska.

Officers of the Poultry Breeders Association are: President, W. O. McCubbin, Los Angeles; first vice president, J. J. Jones, Los Angelcs; second vice president, W. J. Stewart, Alhambra; secretary-treasurer, Walter M. Ross, Glendale; auditor, D. Armstrong, Los Angeles.

For Markets See Pages 96-97.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Ticks in Cattle's Ears

Can you tell me what to do to get rid of ticks in cattle's and horses' ears. I have tried oil and grease but that does not help. I do not like to experiment too much as it might injure the hearing, so am asking your advice.—Subscriber, Inyokern.

Ticks in the ears of animals are very annoying and set them nearly crazy. In some young animals they pierce the ear drum and the animal dies. The usual way of treating such cases is to call a veterinarian who throws and ties the animal and with a small forceps or pliers picks out all the ticks he can reach, but he can not get way down to the ear drum so he may miss some. I was told by a successful cattle rancher that his remedy for ticks in the ears was to put a spoonful of kerosene oil in the ear. He said that this makes the ticks come hurrying out and they can be brushed away and killed. He said it never failed. I am not vouching for this treatment but I do not think the kerosene would do any harm and if I had an animal with ticks in the ears I would surely try it. If you try it please let us know the result.

Goat Fails to Breed

Have a goat six or seven years old which after several trials has failed to breed. Since her last kidding about a year ago she has had a slight discharge which at times contains some blood. She seems well in all other ways and at the present time is giving about a quart of good rich milk a day. She gave nearly four quarts when fresh. Could this discharge have anything to do with her failure to breed

and if so what remedy would you suggest?—Subscriber, Corona.

Probably there is some misplacement of the womb. Only an examination could settle that question and a good veterinarian might be able to adjust it. If there is a veterinarian near you that you have confidence in we would advise calling him in to see the case.

Horse Sweating After Work

I have a Clydesdale mare that seems to be in good health and works every day but after she is in the barn a short time she begins to sweat. Is this wrong and what can I do for her?—Subscriber, Hemet.

If the stable is close and warm, and the horse has a thick coat of hair that would account for it; otherwise it shows some weakness. If the coat of hair is very thick and long we would advise clipping her. If this does not remedy the trouble write us again.

Lame Mule

I have a mule that has gone lame. The trouble is apparently in the rear pastern joint. He walks on the toe only and when standing rests very little weight on that foot. What can I do for him?—Subscriber, El Monte.

Examine the foot. He has probably stepped on a nail or if he has been recently shod a nail may have been driven too deep. When a horse or mule goes lame suddenly always examine the foot. If a nail has penetrated the sole or frog, cut the outer tissue away so the wound can drain and heal from the bottom without the pus being confined. If you do not understand dressing such a wound you had better get some one who does. It should be treated properly or lockjaw may follow.

Scours

We recently came in possession of a Guernsey heifer 18 months old that has scours and its back is full of white worms about two-thirds of an inch in length. She is very thin and weak but has a good appetite. Those who have known the heifer say it has been abused and neglected and is not worth raising. It being of a good breed we are anxious to save it. What would you advise us to do.—Subscriber, Lindsay.

The trouble may have become chronic, which would make it hard to cure, but try this before giving up. Give her a dessert spoon of powdered areca nut in the feed once a day for a week. Then have your druggist prepare these powders. Tannic acid three drams, powdered nux vomica one ounce and powdered gentian four ounces. Mix and make into 24 powders. Give one powder in a little feed once a day while they last. The warbles in the back had better be squeezed out and killed. The heifer will do better when they are gone.

Bad Habits

We have a three year old colt that has some bad habits. When in the barn he puts his front feet in the manger and while in the corral he puts his feet in the watering trough. He also has a short tail. Could anything be done for him?—Subscriber, Atwater.

Switching the front legs below the knees will break him but you would have to watch him and when he attempts to reach the manger with the feet apply the switch. Probably a few lessons would break him. Another good way would be to remove the manger and put his hay on the floor. Then you could put a small box in the corner of the stall about four feet from the floor for the grain. In my opinion that is the proper way to arrange the stall for all horses. Then they can be swept out often and no feed left in the corners to get musty. With the watering trough you could arrange it so he could not go near it except when you led him there to drink, then I am sure you could prevent his putting his feet in the trough. He would soon forget it. Scrub out the tail with warm water that has borax dissolved in it; a teaspoon to the pint. As he grows older the tail will probably grow longer.

CARBON BISULPHIDE WILL EXPLODE

Any person who has any doubts as to the explosive qualities of carbon bisulphide will do well to consider the following: A short time ago two officials connected with the California Date Association were preparing to fumigate a certain room in their packing house. A five gallon can of carbon bisulphide was brought and plates filled with the liquid, the can being left in the doorway. Suddenly a puff of exploding gas and a column of blue flame shot from the orifice in the can to the ceiling, barring the way out. Coolness and presence of mind saved the day, and perhaps the packing house. The flames subsided as the gas burned down and the burning liquid was smothered with a few old sacks that were found at hand. The only possible way in which the explosion could be accounted for was that possibly a spark had been scuffed on the stone floor. Particular care had been taken to turn off all electric lights before starting to fumigate.—D. B. M.

HOGS, HENS CARRY TB TO EACH OTHER

"Science has shown," says Dr. Fitch of the University of Minnesota, "that tuberculosis can be transmitted by swine to poultry and, conversely, by poultry to swine. Tuberculosis in poultry is a common disease in this state and causes heavy losses. Fowls affected with it become lame, their combs lose their luster, and their flesh falls away. There is a generally run-down condition. Tuberculosis can be controlled by the removal of infected birds and by a thorough cleaning up of their quarters. The disease cannot as a rule be transmitted through the eggs. Its introduction can be traced usually to infected fowls."

THE PHILIPPINES

The Philippines were discovered by Magellan in 1521, first settled by the Spaniards in 1565 and controlled by them until 1898, the year of American occupation. The total number of charted islands exceeds 3,000. The largest are Luzon, with 41,000 square miles, and Mindanao, with 36,000 square miles. Next in order are Samar, Negros, Panay, Paragua, Mindoro, Layte, Cebu, Bohol, and Masbate. The islands lie 600 miles off the coast of China in about the same latitude as Central America. The principal cities are Manila, Iloilo, Cebu, and Zamboanga. The total population is about 10,000,000, of which 500,000 are non-Christian or uncivilized tribes. The Europeans and Americans in Manila are 6,250; Chinese and Japanese, 19,910; Filipinos, 257,356.

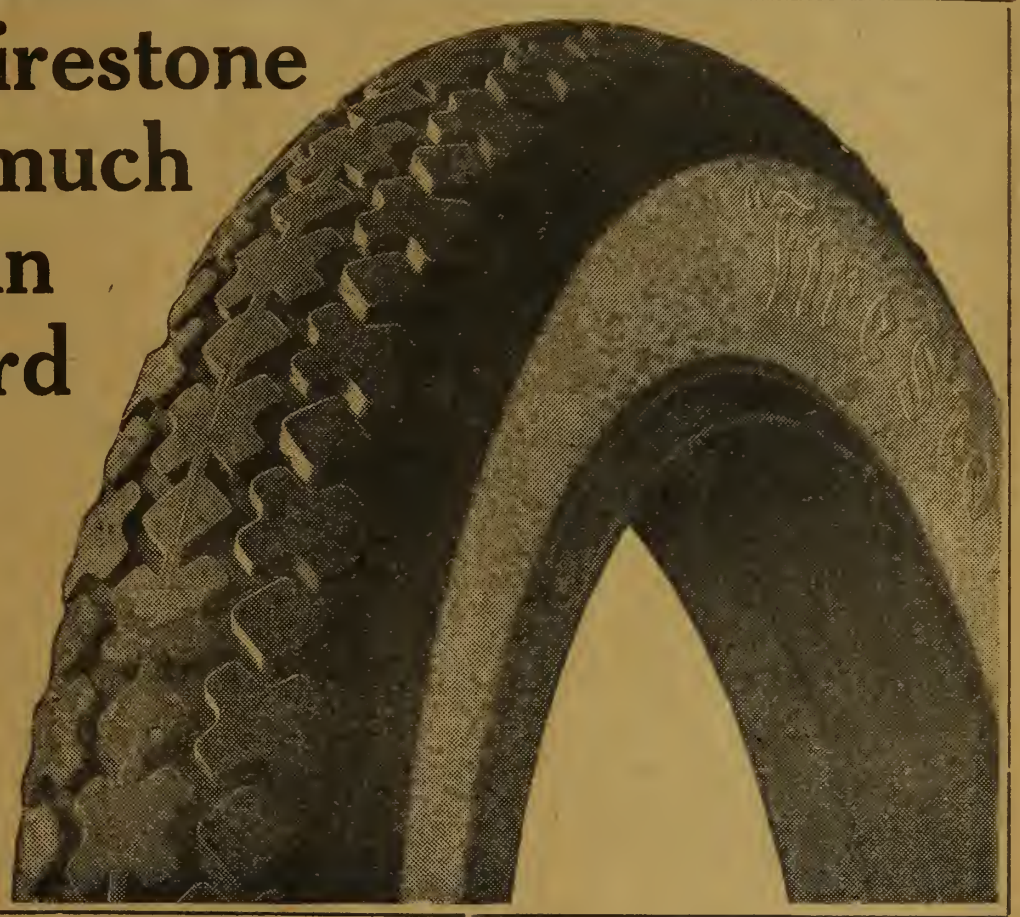
FROM FLORENCE

The United States vice consul at Florence, Italy, reports the exports to the United States for the past six months were of the value of $1,815,239, as compared with $2,493,175 for the same period in 1918, and $1,422,197 in 1917. The greatest value was $545,685 in clover seed, with $431,819 worth of unblocked straw hats as the item of second importance, embroideries, antiques and unbleached straw braid each running over $150,000 and no other articles coming up to one-fourth such values.

CLOSE FRIENDS

Mr. Meant-to has a comrade,
And his name is Didn't-Do
Have you ever chanced to meet them?
Did they ever call on you?
These two fellows live together
In the house of Never-Win
And I'm told that it is haunted
By the ghost of Might-Have-Been.
—Sparks.

Why Firestone gives much more in this cord tire



Most Miles per Dollar

THE dealers say there is no argument—the Firestone Cord, compared side by side with any other, sells itself.

No wonder. It is built to the largest standard oversize of the industry.

It has much greater air capacity than the average. It contains much more material and it delivers extra mileage in proportion. The thicker, heavier tread, that looks and feels the part of its extra mileage, is another reason why it sells itself.

And that tread is as good as it looks from the standpoint of preventing skid, slide or spinning of wheels. It has a tractive power never before equaled in a rubber tread, yet it has no inclosed hollows or suction features to be a drag on speed or a drain on power.

Specify Firestones; your dealer is ready with just your size — Cord or Fabric.

Cows know what they like

Not only must the feed for your cows *be* good—it must *taste* good to them! Your cows know what they like. And—*you* know that the most profitable cow is the cow that converts the most feed into money. It will pay you to feed SUREMILK because your cows "take to it" naturally. They will yield more milk—and that means more money.

SUREMILK is a highly concentrated grain feed. It has a higher feeding value than any one grain because it is a *mixture of grains*—and, therefore, more palatable.

Moreover, comparative feeding tests have proved that SUREMILK will give better results—either more butter fat or greater increase in weight—than any single grain.

Special note to hog-raisers

Hog-raisers have found that feeding SUREMILK builds the porkers up and fattens 'em up. It's better than any one grain such as corn or milo or millet—because it is a mixture of *many* grains. Economical, too—because it is highly concentrated in feeding value and does not bulk.

If you want to know just how different stock feeds compare in food value—send for the new edition of our booklet, "Converting Feed Into Money." Full of practical information and profit-hints. Send for this booklet today—it's free. Simply cut out and mail the coupon below.

How the California Feed Law Affects Proprietary Feeds

By GEORGE R. McLEOD
Agricultural Department
Sperry Flour Co.

All proprietary feeds sold and distributed in California after the first of November, 1919, are affected by the feed law passed at the last session of our Legislature. This law not only requires the names of the different ingredients, but also the minimum percentage of protein, the minimum percentage of fat, the maximum percentage of ash and the maximum percentage of fibre contained in the feed.

Similar laws have been in force in many of the Eastern and Middle Western states for the last ten years, resulting in the education of all consumers of feed. In the different states where these laws have been in effect for some time, consumers are now buying feeds on the actual net feeding value that they contain, without regard to color, texture, etc.

California feeds have been bought and sold largely on color and texture, the feeder depending on his eye to determine the value of the feed.

What Goes Into a Feed?

All feeds are composed of moisture, ash, fibre, protein, carbohydrates and fat. A feed low in moisture has more value than one high in moisture, because this element can be supplied cheaper from the well. Ash is the mineral matter contained in any feed and a low ash content denotes high feeding value. Fibre is the structure around which nature builds the other substances during the growth of the plant and it has little real feeding value, although some is necessary, as it makes a feed more bulky and allows the digestive juices to act more freely. While a certain amount of fibre is digestible, the cost of digesting and assimilating is nearly as great as the feed value derived from it. It is on this account that a low fibre content also denotes a high feeding value.

Summing up the different substances which go to make an economical mixed feed, it is necessary to select one with a low moisture, low ash, and low fibre content—as the average feeder can supply these more cheaply himself.

The Feed Must Taste Good

Palatability is another factor that enters into the value of a feed, inasmuch as the animal that converts the most feed into money is the most profitable one; and a feed must be palatable for an animal to consume a large amount of it. A mixture of grains always has a higher feeding value than any one grain fed alone, because it is more palatable on account of the variety

Have a Head and Use It

SOME heads are sharp and some are dull. Only sharp ones should be used in a pruning operation. We have heard in fruit growers conventions of the past remarks like unto: "When you feel like cutting and slashing your trees throw your pruning hook away and take a vacation." Not very good advice for it is far better to stay with the trees and think a bit. This old world has been growing trees for some years, still we have diverse opinions as to how it is best to treat them. One will say: "It is just as reasonable to saw off your leg as it is to saw off a large branch from a bearing fruit tree." Another will say: "Unless the old and useless wood is removed and new healthy fruit bearing wood secured the tree simply becomes an encumbrance." The non-pruners are now receiving much comfort from the theories of Prof. Whitten who has recently brought to our state university his experience in the Middle West in long pruning.

His methods and comment on them, which have been given at some length in the columns of the Cultivator, brought forth a letter from Alex McGregor, Newhall. In effect his suggestion was that an orchardist might well try a few trees and make closest observation of results. This comment came to the attention of a practical orchardist who has been doing just that thing for many years—Aratus Everett of Moorpark, Ventura County.

A man who has secured a thousand ton crop of Royal apricots each year for four years evidently has a head and uses it, and any word from him will be of value to any other farmer who is working upon this principle. Mr. Everett writes:

"Refering to the article by Alex McGregor in your last issue: 'Have a Head and Use It.' I take this to be, if not a criticism of the new system of pruning deciduous trees advocated by Prof. R. H. Whitten and other scientific writers, at least a question as to the advisability of their methods.

"I have been growing apricots commercially in Ventura County for over 40 years. In 1893 I set out about 150 acres three miles west of where the town of Moorpark now stands. This locality is subject to spring frosts. I soon noticed that the earliest lower blossoms were often killed by frost when those coming out later, say above ten feet, made a crop of fruit.

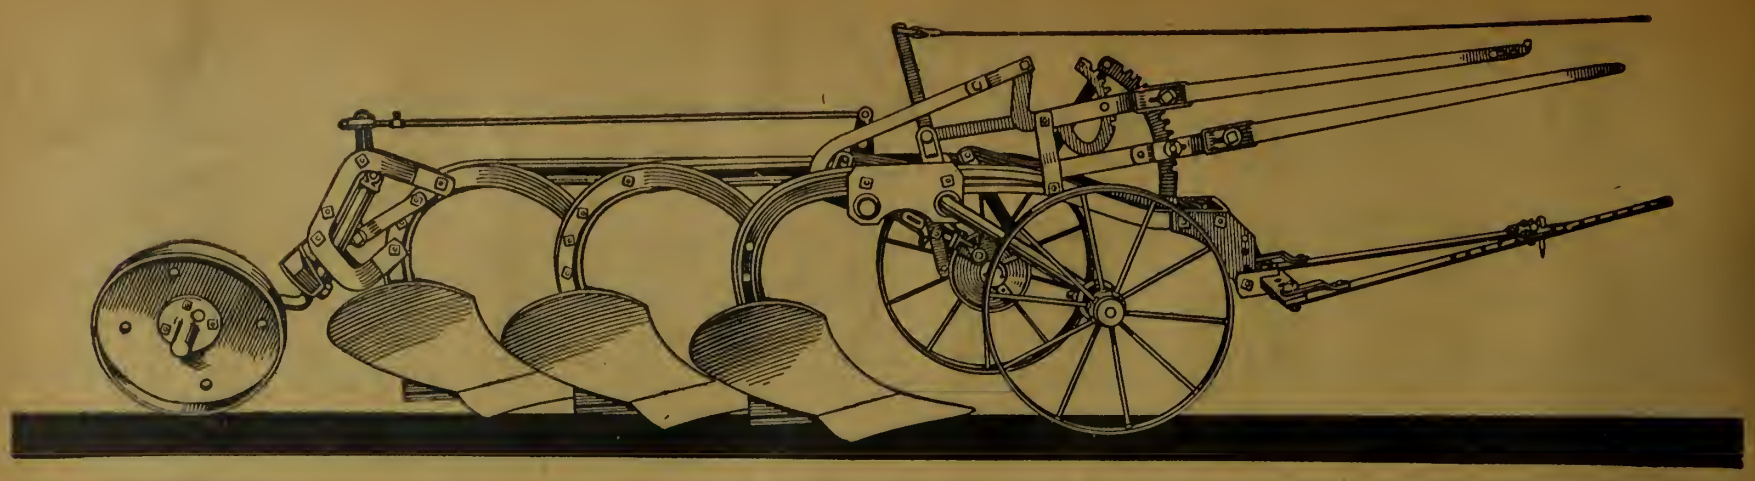
"As I never had approved of the extreme practice of close heading back of young trees, I left from three to five main branches to make my trees and headed back and thinned out the inside branches only. At this time I did not understand the scientific principle as Prof. Whitten explains it but I could see the practical side of it.

"An intimate acquaintance of mine set out about 150 acres of apricots near Saticoy the same year that mine were planted. These were set on rich land. He was thoroughly imbued with the extremely close cutting back system of pruning young trees.

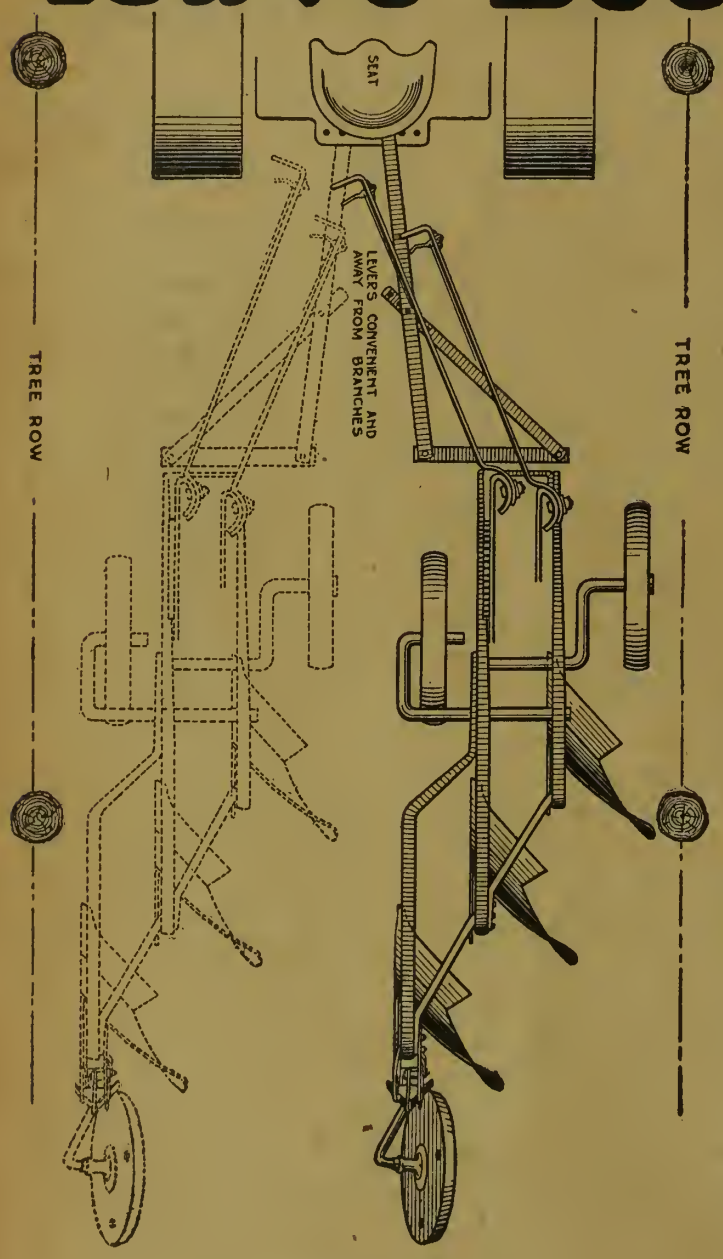
"At the end of five years each main limb of my trees was longer than his whole tree and each of those limbs bore more fruit than his whole tree. From one of my best trees when it was only four years old we gathered over 500 pounds of fine fruit. When this tree was six years old it bore nearly 500 pounds of apricots (green). The intervening year was a fruit failure generally and no record was kept and none has been kept since, but it has borne heavy crops right along and is now in fine condition for a crop this year.

"If we do not die, fruit trees, as well as people, will get old. I notice advertisements in the newspapers to make old people young and spry. I am not trying any of them but when my apricot orchard was about 20 years old I had about one-quarter of the large limbs that were equally distant around the tree cut off about ten feet above the ground.

"A great many sprouts started at the top and some lower down on their limbs. By breaking off all but five or six of these sprouts while they were small, the rest made a strong—(Continued on Page 128).



The Orchard Tractor Plow You've Been Looking For



A Great Feature

With the plow set over to throw either to or from the row, you can quickly angle the levers so that they are easily reached from the tractor seat, out of the way of the limbs and free of the wheels when the tractor is turning short.

A LOW-DOWN TRACTOR PLOW for use with small tractors—a power-lift, easily-handled plow whose hitch and lever construction and wheelbase design permit work right up close to the trees in throwing either to or from the row—that's what you've been wanting in a tractor plow. And that's what you get in the John Deere No. 8 Orchard Tractor Plow.

This plow is the result of close study of the requirements of California orchardists. The suggestions of a number of experienced California fruit growers helped design it. It has proved its special value in many orchards and vineyards. It is also adaptable for general field plowing.

JOHN DEERE No. 8

ORCHARD TRACTOR PLOW

has a reversible hitch and can be set out to either side so that the plow can run close to the trees when throwing either to or from the row. Note this feature in the illustration to the left.

Levers have side adjustment—A feature you will greatly appreciate. See it illustrated at the left. When the plow is set to the right to get close to the row, the levers can be angled the left. When the plow is set to the left, the levers can be angled to the right. In either case, with the plow working up close to the row, the low-set, angled levers are conveniently back of the tractor operator, out of the way of the tree limbs and out of the way of the tractor wheels when turning short. Reversing the hitch and angling the levers is a simple matter—only one bolt to loosen in each operation.

Doesn't scar the trees—With this plow it is easy to keep from scarring the trees while working close up throwing either to or from the row. The furrow wheel has an offset hub—no projections beyond the wing of the inner moldboard, and the land wheel is set close in—*in front of the third beam.*

And these other features—The simple, positive power lift raises the bottoms high and level at a pull on the trip rope by the operator.

The lifting mechanism consists of a single, durable clutch on the land axle. It moves only when the plow is being raised and lowered—practically no wear.

The hitch has a break-pin for protecting the plow when striking a stone or root, and a simple slide and pin lock for quick landing adjustment. Land and furrow wheels have a great range of adjustment for either deep or shallow plowing. There is great clearance in throat of beams and back of bottoms to prevent clogging in trashy conditions or deep plowing.

The John Deere No. 8 Orchard Tractor Plow is equipped with three 10-inch bottoms that scour and pulverize to best advantage.

Don't fail to see this successful plow as soon as possible. You are sure to like it. Ask your John Deere dealer to show it to you.

Write today for a free folder describing the John Deere No. 8. Address John Deere, Moline, Ill. Ask for folder O-17.

No matter what size of tractor you have or what your soil conditions are, there is a John Deere Tractor Plow that will meet your requirements. Besides the John Deere No. 8, there is the small John Deere 23-A three-disc plow for small tractors, the No. 24 four disc, No. 25 five disc, and No. 5 and No. 6 two, three and four bottom moldboard plows for large tractors. All are specially designed for both orchard and general field work.

Vol. LIV, No. 4 | Los Angeles, January 24, 1920 | One Dollar Yearly

Who is to Blame?

THE bean growers of California have been accused of being to blame for the late lamented slump in beans. It is repeatedly charged that they could have sold but were so busily engaged in trying to fix prices which would hold up the public and secure undue benefits that they let the golden opportunity slip.

The intelligent reader of bean news during the past 12 months knows that this is not the case. However, in order to assure himself of the facts, State Market Director Weinstock addressed a letter to the California Bean Growers Association, asking for particulars on this point. A review of some of the diverse transactions in bean operations is given in the letter of reply which was written by Geo. F. Maddock, vice-president of the California Bean Growers Association. This association has its headquarters at Sacramento.

Mr. Maddock Writes:

"The criticisms of the association which have been brought to your attention are entirely erroneous. At every opportunity given the association to sell beans to the government, beans have been sold and in every case sold at the government's price. We have not always been given this opportunity since it seems that the food administration department having charge of the bean purchases is directed by men closely connected with the Bean Dealers Association, so there were several purchases made which were not available to the Bean Growers Association. Several conferences were had with H. Clay Miller of San Francisco, who had charge of the purchases for the government and where we were given the opportunity to sell some of the association stock. In every case this stock was sold at Mr. Miller's own price.

"We have time and time again submitted our beans to Ralph E. Merritt, food administrator of California, and to H. Clay Miller, explaining the necessity of disposing of our crop of beans, and only within the last month or two we have made an offer to the President of the United States of every bean that we have at such prices as may be approved by the government, and yet we have not been able to dispose of the crop.

"You make reference to the criticism of some gentleman who was on the staff of Herbert Hoover in Washington, claiming that the association demanded an abnormal price for its beans and that the government as a matter of protection was obliged to import beans from the Orient to the ultimate disadvantage and loss of the California Bean Growers Association.

"The statement as submitted to you is erroneous. This question has arisen before. The same statement was made by Ben S. Allan, former publicity manager for Mr. Hoover and now proprietor of the Sacramento Union. I have discussed this matter with Mr. Allan and after explanations by myself and by Mr. Turner, he acknowledged that he was mistaken in regard to a representative of the California Bean Growers Association being present at the conference which he stated took place. If California was represented at all at these conferences it must have been by a representative of the Lima Bean Growers Association of Southern California, with which we are not allied. Mr. Allan definitely states that he was mistaken in regard to this criticism, that he had made the same criticism to F. W. Kiesel and to others in Sacramento in discussing the bean situation, and that he knows that he has made a mistake and he has since further tried to rectify such error by putting a representative of the California Bean Growers Association in communication with Mr. Hoover, with whom this subject has been discussed in New York or Washington only recently.

"I want to most emphatically state that the California Bean Growers Association has made every effort possible to dispose of its stock of 1918 beans both to the public and to the United States government, and in every case we have endeavored to sell our beans at such prices as will make only a moderate return to the grower, and in the case of the United States government we have offered these beans at prices to be set by the government itself.

"I would further call your attention to a situation in which the importers of Asiatic beans were given an opportunity by certain officials of the food administration bean department to import Asiatic beans into this country in competition with the American grown product, at which time the American grown product was not given an opportunity to participate. I can not repeat the details of this transaction, but you are undoubtedly aware of the whole situation. A thorough examination and investigation was made in New York a few months ago and it was definitely shown, I am told, that Mr. Kimball and others of the bean department of the food administration were responsible for certain transactions which they undertook in connection with this deal, and that when a transcript of the testimony of this investigation was submitted to Mr. Hoover he was highly indignant and referred the entire matter to the department of justice at Washington to take such action as was expedient in the matter.

"I would further refer you to Ralph P. Merritt and to H. Clay Miller, with whom the association has had numerous conferences in regard to disposing of its crop, and if these gentlemen will be reasonably fair towards the association they will speak most highly of our actions, patriotism and our desire to cooperate in every manner with the United States government's desires in handling our crop. The government is undoubtedly at fault in importing Asiatic beans into this country in competition with the American grown product. It is principally at fault because certain officials of the food administration were making private gains by so doing."

In confirmation of the last statement made in the second paragraph of Mr. Maddock's letter, in effect that the bean growers had made offers to the president and had not been able to dispose of the crop, we can refer to the columns of the California Cultivator of December 28, 1918, where on page 658 we call attention to the lima bean situation, largely in Ventura County. We stated:

"For instance, the lima bean people have a large supply of beans cleaned and sacked, ready for delivery, but for which there is no sale. They were approached by a broker 'who claims he has an inside pull with the government,' and who agreed to take 40,000 sacks for government delivery providing he were paid his commission. As the association had the only supply sufficient to meet the demand of the war department, it could not figure out why its members should be deprived of a part of the cost of producing the beans to pay the middleman. The middleman insisted that the deal could only proceed through him and made good in calling the entire deal off, and the government has failed to deal direct with the people who raise the beans."

The government might use this fact that the bean growers would have been able to sell in this particular case, but the bean growers feel that only greatest injustice would have been wrought by consenting to forced payment of commissions to private parties—C. B. M.

Cauliflower in California

By E. Braunton

MORE than a thousand carloads of cauliflower have gone East from the Los Angeles section since the opening of the season, some weeks running as high as 125 cars. From a feeble and discouraging start a quarter century ago the industry has grown to gigantic proportions.

In the early 90's cauliflower was grown only for local consumption by Chinese, and occasionally a mixed car of vegetables carried a few eastward. In 1892 A. Beli, an Italian, moved to Whittier, sent to Italy for seed and planted 60 acres. Previous to this time only the Snowball variety had been grown commercially. The Beli crop was fine and a few cars were sent to Chicago, enthusiastically received, and this was really the beginning of the cauliflower industry in Southern California, with a variety heretofore unknown to this country.

But the favorable beginning was not to go unchallenged. Heavy rains came soon after shipments commenced, the railroads were washed out and none but the early packed cars were sent out. The grower went bankrupt and the remainder of the crop went to seed. The surplus of crop and seed, however, opened the eyes of a few to the wondrous possibilities and profits from such a crop in normal years. The backer of the initial enterprise gathered the Beli seed crop and sold it. George F. Prince, now of the California Vegetable Union, distributed the seeds that year to the Chinese growers and next season the shipments greatly increased, as the demand from the East was strong.

Now we have single fields that grow more than the state's output at that time. The largest grower—doubtless in the world at the present time—is Williams Brothers Ranch Company, operating on the Laguna ranch southeast of Los Angeles. This company farms more than 1,000 acres in one piece and at present has 400 acres in cauliflower. Crop rotation is practiced, some land is always in alfalfa, sugar beets or lettuce, and as they

(Continued on Page 131)

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

EFFICIENCY

"No business justifies itself today unless it contributes greater efficiency in production, greater justice in distribution and greater wisdom in consumption."

We believe the efficiency in production and wisdom in consumption are far nearer realization than justice in distribution. Here's hoping.

DECIDUOUS STATION

The work of the experiment station staff is now to be balanced up by the establishment of an experiment station made possible by act of the last legislature. It is to be located at Mountain View, Santa Clara County, and will be under direction of W. L. Howard. Prof. Howard will be assisted by Prof. E. O. Essig. This station will investigate insects and diseases affecting deciduous trees and, in fact, general deciduous cultural matters.

COMPENSATION INSURANCE

The state compensation insurance fund reports losses to a lesser degree than anticipated and makes rebates or a dividend of 17½ per cent under policies issued during the year 1919. It will be three and a half years before it will be definitely known as to the entire dividend which may be returned, but with this cheapening of the insurance and notwithstanding "exemptions" of farmers it is perhaps wise for farmers who are employing to protect themselves.

HERESY

While we are permitting the entrance of more Japanese and talking about importing a million or so of Chinese labor and wondering what we are going to do to get the world's work done, would it be in order to suggest that out of the 24 hours we might once more devote, say, about ten hours, to good hard work? The ordinary farmer may reply to this in effect that he is now putting in about 14 to 15, and the labor union will accuse us of uttering heresy, so we withdraw the suggestion.

SCHOOL AT RIVERSIDE

The land has been purchased and it now appears that Southern California will soon have a school which will give to Southern California boys and girls agricultural education privileges.

Because of the long distance to the school at Davis it has been urged for some years that there should be located south of Tehachapi a practical school similar to that of the North. A state school has been maintained at San Luis Obispo. This school has not been under the direction of the state university but has rendered excellent service to young people of San Luis Obispo and adjoining counties. The one now to be located farther south will be under direction of the state university as is that at Davis. The courses at this school will be more nearly along the line of high school courses with the addition of two or three years of practical farm work under direction of scientifically trained men. The South, and Riverside in particular, are to be congratulated that this school work is finally taking definite shape.

BIG FARMING

Californians have sometimes looked with dread on large corporations controlling great tracts of land for the reason that this extensive farming has prevented the small farmer with his intensive methods from securing a foothold, and, in addition, especially under wasteful methods, has yielded extremely light production of human food. But intensive culture in a large way can be received more cordially.

We note a movement is on foot for intensive culture of a large tract in Monterey County not far from King City. It will be financed by Los Angeles capitalists and under the direct supervision of Carlyle Thorpe, manager of the California Walnut Growers since that organization was formed. C. C. Teague, for years at the head of the Limoneira lemon properties of Ventura County, is also connected with the concern. If steel and copper and automobiles and farm implements can be manufactured more cheaply and more profitably through large aggregations of capital, it should also be possible in the manufacture of potatoes, nuts and fruits.

COOPERATION BUSTING

Trust busting has been the popular pastime for some years. It is possible much good has been accomplished for there have been trusts which have violated all the rights of men and probably many of the laws. Just at present there seems to be an onslaught on the cooperators. Farmers organizations in California have been forced to send their principal officials to Washington in order to show cause for existence as a cooperative organization. Raisin growers and peach men have both been attacked. Now comes the dairymen's turn. This time the state's attorney general questions the right of the farmers to unite and employ business men to dispose of the products of their farms. Every cooperator in the state has a vital interest in this fight for if the dairymen's association goes down other associations may expect their own finish within a short time. No greater blow could be given to food production interests in the state for as soon as collective action on the part of the producers is denied production will certainly be lessened.

ECONOMIZE

The war loan organization of the 12th federal reserve district is appealing to Westerners to pledge themselves to the budget system of management of their households during 1920. The leaks in the purse of the ordinary American must be plugged up. Then, of course, the savings are to be invested in government securities.

This is an excellent suggestion and we will join, not only because th department is suggesting it, but be cause the H. C. of L. and a few othe factors are absolutely compelling i There is a whole lot of truth in the re ports of awful extravagance of som portions of the people; there is mor truth in the statement that the grea mass of us wouldn't recognize extra agance these days if we met it. W have seen it stated that the extrava gant spendthrift is being overadvertis ed by zealous merchants and due cre it is not being given to the rank an file, the bone and sinew of our natio Most of us are doing as we have sinc we began buying, save that a littl more care and attention is of nece sity given to the value of every penn

MAKING GOOD

The news sheet of the Unive sity of California reports: "464 St dents of State University Disqualifie to Return for Study."

In the items which follow it is sta ed that this number represents 6 per cent of the total undergraduat body. This number is declared to b within the limit of the averages past years. 319 of these 464 student are men and 145 are women. T University of California has becom one of the greatest educational ins tutions in the United States. Pe haps we are entirely safe in sayin the greatest, for it has become so numbers and its reputation has gon around the world, hence there is gre honor in being admitted to its course However, a word to the 464.

Presumably some of them are fro California's farms. Some of the have tried hard, and perhaps in th greatest of all prerequisites of huma success, common sense, may be qualified that future years will yie them success equal to that of t brightest of those who finished wi honor their university course.

We would not discourage one these young people from looking f other educational advantages, in fac the only salvation for them, as f all of us, is to look for every possib help in securing qualification for mee ing life's problems. There is one ins tution always open, the University Hard Knocks. It has qualified mar a young man and young woman meet difficult problems and comp success.

John Hays Hammond in an artic in Colliers Weekly of January 10 as why we send our young people to c lege. He answers: "Not primarily become graduates of Yale or Harva or Princeton or of any other instit tion. We send them to strengthe character and get knowledge of a kin that will help them to better serve t world." Later in the article Mr. Ha mond makes the point that many young person can avoid wasted yea by following his preparatory scho work with rich and large experien with practical everyday affairs of lif

Mr. Hammond is a bit caustic r garding the curricula of some school "This is not to say that a collegia education is useless. Far from tha it gives a man an immense advanta over his self-educated fellow of equ intellectual powers, but the boys ha too much to learn about things th should know and too much to forg about what they did not need to kno in the first place. They have spe too much time on subjects which th will not use and too little on some the subjects which they most despe ately need."

In any case, Boys and Girls who a "disqualified," qualify for a life service. There is a great big wor before you with wonderful oppo tunities.

PARENT OF ALL MANKIND!

"Army officers from stations in the Orient, who recall the 'Me und Gott' attitude of the German imperial dignitaries before the war, were exhibiting yesterday," says the San Francisco Chronicle, "translations of an article in the Japanese newspaper Niroku when the transport Sherman docked. The article has been translated and published again in the Japan Advertiser, an English language newspaper of Tokio, in its issue of May 9, 1919. The Niroku is regarded as the official mouthpiece of the Japanese government on all important matters of state.

"B. R. Robinson, Y. M. C. A. secretary on the Sherman, supplied the article, which follows:

"'To preserve the world's peace and to promote the welfare of mankind is the mission of the imperial family of Japan. Heaven has invested the imperial family with all the qualifications necessary to fulfill this mission.

"'He who can fulfill this mission is one who is the object of humanity's admiration and adoration and holds the prerogative of administration forever. The imperial family of Japan is as worthy of respect as God and is the embodiment of benevolence and justice. The great principle of the imperial family is to make the popular interests paramount—most important.

"'The imperial family of Japan is parent not only of her sixty millions, but of all mankind on earth. In the eyes of the imperial family all races are one and the same; it is above all racial considerations. All human disputes, therefore, may be settled in accordance with its immaculate justice. The league of nations proposed to save mankind from the horrors of war and can only attain its real object by placing the imperial family of Japan at its head, for to attain its object the league must have a strong punitive force of a superior national and superior racial character, and this force can only be found in the imperial family of Japan.'"

Orange County Soils

By Ernest Braunton

ORANGE COUNTY has recently had a series of field soil lectures and demonstrations of an extremely practical nature. Armed with a soil auger the lecturer stalks into the field, bores down into the soil, uses the auger as a station and to lean upon betimes and discourses to his audience on what is beneath their feet. Afterward he bores deeply and brings up samples to prove the truth of his statements.

Farm Adviser Wahlberg had as his guest during last week J. W. Nelson, professor of soil technology at the state college of agriculture. Prof. Nelson has been with us ten years, previous to which time he was for 12 years with the bureau of soils, United States department of agriculture. At Yorba Linda he spoke in part as follows:

"This region is an old alluvial plain elevated by mechanical action and is now in advanced age. During the last hundred years it has been getting into the condition you now find it, the subsoil getting harder and closer all the time. The rain each year percolates and carries with it the finer particles of soil and, finally, unless the process is arrested, the subsoil becomes hardpan. This is due largely to iron salts or silicates.

Danger From Hardpan

"This tendency and condition the farmer must overcome by intelligent practice, for when roots reach this hardpan it is high time to act. This hardpan is not at uniform depth for rains do not percolate evenly in such soils. When they strike this hard stratum they can go down but little more and that but slowly. The rains or irrigation water meet the same resistance. Water lying thus develops a toxic condition and trees are thereby harmed and may in a few years be killed. One farmer, visited some years ago, had land of a 30 per cent slope and presumed his subsoil was parallel with surface and therefore provided perfect drainage. But after eight or ten years of irrigation his trees began to suffer, and cat-tails and rushes began to grow in spots. Tests with a soil auger proved that his subsoil had an undulating surface, the little hollows forming shallow reservoirs in great number, and the water lying therein poisoned the tree roots.

"Another rancher had an almond grove not irrigated for 30 years. When the nuts were half grown the trees did not appear in best condition, so a heavy irrigation was given. The water went down to hardpan, among the feeding roots, a hot spell of weather came which rapidly developed a poisonous condition, and in one week his trees were dead.

"Get a soil auger and bore down six feet at specific distances over all your orchards and make a subsoil or hardpan map. Note particularly if it is as far down to hardpan at the upper end of the orchard as it is at the lower end, and if water is percolating to a like depth. Do not look at the tree to see if it appears to need irrigating, for it is then too late for best results, for the tree gets a shock from shortage of water and another when it gets a sudden and copious supply. This series of shocks is highly injurious. Use a soil auger to determine when irrigation is necessary. I find that orchards south of the Tehachapi are but 60 per cent of normal.

Wet All the Soil

"In many orchards but 80 per cent of the area used by the trees is irrigated. Water is run so far from the rows that tests show four feet about the trunk is not wet during irrigation. This is therefore useless ground during the growing period. In the winter, after rains, this space becomes saturated and we have a 100 per cent growing area. But it is not then needed! Fall blooming often results from this stimulus to working roots nearly dormant during the summer. This so-called false blooming is highly injurious.

"I know a citrus orchard that was badly affected with mottle leaf. The owner was advised to run water down furrows about ten inches from the trees. This he did and in six or seven years the mottle leaf had entirely disappeared, though the case was a bad one. If we do not properly handle our soils the orchard areas may be back in grain in 50 years, for that is the history of many orchard sections in other states. Kansas is a notable example. You must replace the nitrates drawn out by the crops. Organic matter must be introduced. Keep up the supply of nitrogen. Every time you plow or cultivate you lose nitrogen and in some way you must put it back.

Double Cover Crops

"Double cover crops will solve many serious orchard problems. After a winter cover crop is turned under the surface seven inches of soil shows a temperature of 120 to 130 degrees in warm spring weather. This is bad for humus, which is burned out through exposure, for heat oxidizes the organic matter and summer cover crops keep the soil cool and bacterial activity is good. Moreover, summer tillage is not needed and so the cover crop is not an added heavy expense. I know of one case where a reddish brown cemented soil was converted to a fine soil in seven years. In 48 hours the water would go down but 20 inches. Seven years later it would reach 48 inches in 24 hours. This was under double cover cropping and the soil was also doing its own fertility work. Where no water is available for summer cover crop apply barnyard manure if you can get it.

"Now that the farm bureau movement is so well organized we should hire a man to buy up all the farm manure in six or eight Western states. Maine potato growers are shipping it from these states and if they can afford to do so for potatoes we can afford to do it for our orchards. We should have it shipped in solid trainloads. Care for manure; 65 per cent of the value of stable manure is in the liquids and this may be washed away. Also lime your soils. Lime being easily soluble is one of the first things carried away after soil is stirred. We cannot too much advise on experience gained at the state farm at Davis, for soils vary much and their amelioration is a local problem for each farm center.

"Plant cover crop last of August or early September. If no rains come, irrigate. If soil is hard and rains light, lime will open your soil and a series of check dams or deep furrows will hold the water. Disk cover crops in if soil is double cropped, but if only single crop is used, turn it in deeply, one foot if possible. See that soil is filled with water during winter as a base for lighter applications during summer. Do not merely irrigate every 30 days or any other specific period if you have any choice. Use the soil auger to determine when water is needed. Cover crops may be of cow peas or Melilotus alba. These annuals are generally better than alfalfa, for the latter usually is harvested, though the deeper rooting is highly beneficial."

Asked if disks or mouldboards were most favorable to hardpan, Prof. Nelson replied that disks packed the soil less, also do not tear out roots as do plows proper. Asked as to deep cultivation or plowing, he said that farmers who claimed to plow deeply turned over but four or five inches, as was proven by measured furrow—that ten inches, which really is deep plowing, is most unusual. Where soil surface is very hard and rains run off, he advocated plowing very deep furrows, filling in with bean straw, or some such material, thus making a permanent trap for rain water.

Cotton Yield in the San Joaquin Valley

By A. Layman

WE have heard cotton growers say: "Half a bale is fair; a bale to the acre is big; but two bales—that's some cotton." So a chronicle of cotton growing in Arizona as recorded by Mr. Bemis in the California Cultivator of January 10, in which the champion cotton grower was reported to have secured a yield of 11 bales, averaging a full 500 pounds, from a little less than seven acres, showed a great production. Arizona may well be proud of it, and it's an indication of a great future for cotton production in that state. As Mr. Bemis said in that article, big yields are sometimes more or less accidents, in any case they are not averages, but it is well that we may chronicle these striking productions as an inspiration to all of us to use to the limit the resources in our possession.

A subscriber at Arvin, Kern County, Milton Roderick, sends copy of the Bakersfield Californian which reports a meeting recently held in Fresno. One feature of this meeting was a report made by Gordon T. Ives regarding his own production. It is not simply a chronicle of totals, but of methods as well which are used in securing that production. Outline of these methods is given by Mr. Ives as follows:

Planting began April 2 and was completed April 6.

About 12 pounds of Pima seed was used per acre—it was planted flat.

Owing to insufficient seed being planted (20 pounds would have been better), and the ground drying out, I did not get a perfect stand, so I ran water close to one side of the rows April 23 to germinate the rest of the seed, which had the desired result.

I began cultivating with 14 tooth cultivator as soon as I could see the rows. Six cultivations were given before the first irrigation, which came about June 19.

I stirred the surface as above after each irrigation until the cotton got too tall for a horse to get through.

This cotton is planted between 14 foot rows of Thompsons, being three feet ten inches apart, two rows.

Chopping (mostly pulling) began June 9, when the plants were a foot to one and one-half feet high. We aimed to thin to about eight inches.

Frost came about October 23, which was about a month earlier than last year. Picking began November 9. The price paid for picking the first half of our crop was four cents per pound. The first picking was finished January 1. The amount of first picking was 13,700 pounds. We expect about 1,500 pounds from the second picking. This will be close to ten bales from five and a half acres.

Mr. Camp, government cotton expert, and Mr. McGee, buyer for the Goodyear Rubber Company, measured the fiber and found it 1 14-16 inches.

My nine irrigations, ending October 23, could have been materially reduced had my ground been level and had I used wide ditches that reached from one row nearly to the other.

The cotton plants in our field stood quite uniformly three and one-half to four feet high, except in about an acre, where the water ran too fast.

A good crop of bottom, middle and top bolls matured.

Our best picker, a lady, picked 136 pounds one day, making $6.12. Several others could pick over 100 pounds per day.

John W. Gilmore of the state university has given much study to California cotton production. In addressing the same meeting he touched upon the importance of the great Southwest as a cotton producing section. He said:

"The San Joaquin Valley, especially the southern counties, owing to climatic and soil conditions, are best adapted to long staple varieties including both upland as well as Egyptian. In fact, California and Arizona are the only two portions of the country where the Egyptian varieties can be grown successfully, and in my judgment it is not worth while for the farmers of this part of the state to compete with the farmers of the cotton belt in producing other staple varieties.

"Two important factors are essential in making a cotton industry in this part of the state permanent," he continued. "It is essential for the best interests of the industry that types or varieties of cottons be not mixed in a community. Mixing of varieties always results in deterioration, from which defects some portions of this state have already suffered severely. The farmers should adopt as early as possible one variety of cotton and perfect the culture and quality of that variety.

"It is also important that cotton be produced as much as possible upon family farms. This is not in disparagement of the larger estates, but is stated for the reason that if a few acres be produced upon every family farm it would render the erection of gins profitable. Moreover, cotton culture is well adapted to the labor and time-conveniences of families.

"Although cotton culture is seldom a complete failure, yet farmers must not get the opinion it is easy to grow. The quality and yield can be greatly improved by superior culture methods. Upland cotton is ordinarily sold according to nine grades, and Egyptian according to five grades, and the prices between these several grades vary widely. This is merely to indicate the wide variations in quality that our commercial cottons have. Every cotton grower should strive to produce cotton of the highest grade possible, and with our excellent climatic conditions at the time of picking there is little excuse for presenting cotton of the lowest grades from this part of California."

Agricultural News Notes of the Pacific Coast

Northern California

More raln, please.

Californla is now shipping rice to the Orient.

Shasta County will greatly increase its rice acreage.

A Butte Couuty turkey raiser recently sold seven turkeys for $87.

El Dorado farm bureau people recently visited the university farm at Davis.

Chico, Butte County, recently shipped 2,000 tons of prunes to European points.

Thousands of barrels of wine were loaded on shipboard and started for England before January 16.

Yolo County Shorthorn breeders are bringing in a bunch of fine pure breds from best Eastern ranches.

Auto trucks recently transported 60,000 almond trees from Woodland to Arbuckle, Colusa County.

Farm bureau leaders of several western staes made a tour of Sacramento Valley counties last week.

The almond growers give credit for much of their success this season to well dlrected advertising campaign.

California now stands second as a rice producer, having passed both Texas and Arkansas. Louisiana is still first.

The California Oriental Exclusion League ls insisting on excluding not only Japanese, but Hindus, Chinese and all Asiatic races.

The farm bureau of Glenn County has an ambitious plan to acquire timber land and produce lumber for the benefit of the agricultural industry of the county.

Owing to strikes and labor shortage boats and barges along the Sacramento River have been a very small factor in transportation during the past summer.

All records for rice shipment from the Glenn County section were broken last month. The biggest six day shipment was 81 cars.

State Market Director Weinstock has tendered his resignation because of ill health continued since a recent attack of pneumonia.

An auto ferry service is to be installed across Carquinez Straits from Morro Cove near Vallejo to Valona near the Crockett sugar mlll.

Alameda County wool producers have recently made sales at between $1.25 and $1.40, this on scoured basls. One shipment of 500 tons was recently made.

Prof. Jaffa states that California rlpe ollves contaln much of nutrition and that while green olives may be good as a relish they are of practically no value as a food.

An almond grower of Byron, Contra Costa County, has greatly increased hls output by giving his orchard irrigation. It was formerly handled as a dry farming proposltion.

The Poultry Producers of Central Callfornla, Inc., is doing pretty well, thank you. It has recently been taking stock and finds lt has closed a successful year at a profit of $65,000.

Tehama County farm bureau meetlngs: Bend, January 16; Richfield, 19; Corning, 21; Los Molinos, 26; Proberta, 28; organlzation at Liberal school, 30; directors' meetlng, 23, 10:30.

Central California

Tulare County has chosen September 14 as the date of its next fair.

Several hundred acres of new vineyards are being planted near Tulare.

Two cars of hogs recently sold at auction at Modesto at the rate of $14.05.

Santa Clara County produced two and a half mllllon pounds of dried peaches.

A large number of new members have just united wlth the Farmers Union local at Turlock.

A dehydrating plant with capacity of 50,000 tons is contemplated at Salinas, Monterey County.

Valuable pure bred Holstein bull belonging to Glst and Son, Tulare, recently died from bloat.

Stanlslaus County Holstein-Friesian Breeders Association has been organized. A. M. Bibens is president.

Stanislaus County farm loan association received lts regular dividend check from the federal land bank at Berkeley.

The San Joaquin Light and Power Company plans new construction during the next five years which wlll cost in excess of $50,000,000.

A cereal experiment station giving especial attention to best varieties of wheat has been establlshed on a large ranch in Monterey County.

Salinas, Monterey County, is having serious discussion with itself as to manner of handling tractors and cattle on the public highways.

The Farm Bureau Marketing Associatlon at auctions, mostly in the San Joaquin Valley, sold a total of 49,123 hogs which returned $1,705,752.

Tulare poultrymen will meet February 2 to listen to addresses by Prof. Dougherty of the university farm and discuss business of the local association.

The soldiers colony at Delhi, Merced County, built under the state land settlement commission, is taklng shape in the construction of laborers' cottages.

The Monterey County Cattlemen's Associatlon recently met at Kings City. The cattle industry of the state now represents an investment of $3,000,000.

Milk producers of Stanislaus County are asking the Milk Producers Association to pay for milk not only on the basis of butter fat content but also on total amount of milk.

Fig growers of the state are endeavoring to get together for the sake of cooperative marketing. The lnitial steps were taken some weeks ago at Fresno and the new association is now drawing to itself new members dally.

Eldorado County farm bureau directors are after land speculators who are buying real estate at reasonable prlces and selling at greatly increased speculative prices. They resolve: "It is our further belief that this method of dealing in real estate is pernicious and obstructive."

The Central Californla Berry Growers Association, membership of which is coufined largely to Santa Cruz, Monterey, San Benito, Santa Clara, San Mateo and Alameda Counties, has closed a most successful season. There are 243 members controlling 1,022 acres of strawberrles, 164 of loganberries, 149 of blackberrles, 168 of raspberrles.

Southern California

More rain ls the cry of every grain and hay grower.

Beet planting is starting ln many Southern California sectlons.

A citrus pruning demonstration was given at Covina last Saturday.

Citrus growers of Pomona Valley received over $15,000,000 for last season's crop.

Orange County orchardists are giving winter lrrigation and thoroughly soaking subsoll.

Palo Verde Valley claims production this year of 102,000 bales of cotton from 167,000 acres.

Many citrus growers are urging holding back on shipments of navels until market stiffens.

A long staple cotton gin is assured to Brawley if her producers will plant 235,000 acres to Pima cotton.

Los Angeles County forester and many assistants are placing 450,000 trees on the mountain slopes.

A new water associatlon has been formed by farmers near Ontario and a number of wells will be sunk.

The next Natlonal Orange Show begins February 13, ends February 23. "Swat the jinks" is the slogan.

Pomona Valley apricot and peach growers produced approximately $1,300,000 in their orchards last season.

The farm bureau of Santa Barbara County recently held a meeting at Carpinteria and organized a local center.

Bean growers of San Fernando Valley have organlzed with headquarters at Van Nuys. W. J. Petit is president.

Prof. Bioletti of the state university has been giving pruning demonstrations ln Southern California vineyard sections.

The Sespe Power Company of Ventura County is developing a big lrrigation project, securlng waters from Sespe canyon.

Orange County is planning for a showing of her citrus possiblllities at the coming National Orange Show at San Bernardino.

The Citrus Growers Protection Association of Pomona Valley has done some most effective work during the past week in frost fighting.

Prune and apricot growers of Ventura County recently held a meeting at Santa Paula and llstened to address of H. C. Dunlap of San Jose.

The Ventura County fair directors have recalled their fair dates, September 1 to 4, and are canvassing the season for other dates which will not conflict with state or county fairs.

Pomona Valley in eastern Los Angeles County manufactured something over $9,000 worth of sorghum syrup this past season. The average of the better cared for crops reached nearly $300 per acre.

Southern California dairymen are confronted by a serious feed problem. Alfalfa lands have been reduced until established alfalfa acreage is now renting at around $60. Other feed ls proportionately high and pasturage ls nil.

California produced more than 102,000 bales of cotton during 1919. Approxlmately 82,000 bales of this was produced iu the Imperial; 18,000 in Palo Verde and Coachella Valleys and the balance ln Klngs, Fresno, Kern and Tulare.

The Coast and General

Arizona's cotton plcking season is not yet finished.

Malheur County, Oregon, recently sold $100,000 worth of good roads bonds.

The Northwest Milk Dealers will convene in Portland, Oregon, February 3-5.

The bureau of forestry of Hawaii is urging more careful attentlon to forest production.

The American National Livestock Association convenes at Spokane, January 27-29.

The Inland Empire Bee Keepers convention opens at Spokane, Washington, next Monday, January 26.

The state of Oregon is constructlng bridges and culverts, the contract price of whlch will amount to $11,696,777.

Port Angeles, Washington, is building a $20,000 cannery. It ls owned by business men and farmers of the communlty.

Arizona has been glven generous rains with heavy snow in the mountains. The precipltation at Nogales was 1.88.

Thirteen thousand acres of some of Oregon's best potato lands were recently purchased for the use of white farmers.

The Jackson County farm bureau recently held a fat stock auction, selling hogs at 16 cents and sheep at 12 cents per pound.

One of the largest ranches sold recently in Arlzona was that commonly known as the Kyrene Ranch, comprising 750 acres in the Salt River Valley, on the railroad from Phoenix to Maricopa. This has been run as a stock ranch for many years but will be planted to cotton this comlng year.

The bankers of Maricopa County, Arizona, are to begin a campalgn for the assistance of the farmers by furnishing some facts from authoritative sources, showing the advantages of proper crop rotation and the maintenance of livestock. This information will be sent out in the form of pamphlets.

Citrus growers of the Salt Rlver Valley, Arizona, held a school or institute at one of the groves January 6 and 7. This was conducted under the dlrection of County Agent H. C. Heard and the speakers were officials of the horticultural commission, state college of agrlculture and the United States department of agriculture.

Twenty thousand acres has been added to the lands under the Salt River, Arizona, project that are to have permanent water rights. A long drawn out legal battle has been finally settled in favor of owners of certain lands and by the decision of Secretary of the Interlor Franklin K. Lane these lands now are a part of the project and as such are entitled to receive water.

One of the cotton ginning companies of the Salt Rlver Valley, Arizona, is installing a bolling machine to save a large amount of lint contained in the late bolls that do not open. It is expected that this will enable the saving of some 5,000 bales of cotton that otherwise would go to waste. The value of the lint will be about half that of the lint from mature bolls but even at 40 cents a pound farmers consider it worth saving.

Citrus Trees and Alkali

By E. L. Koethen

MANY citrus growers in California are coming to the conclusion that the accumulation of alkali in the soil is the source of much of the trouble encountered by them in the production of their fruit.

That this is at the bottom of much trouble is shown by the condition of the trees in many orchards irrigated by wells in which the water is highly impregnated with alkali. But it is not generally recognized that we are all threatened with the same trouble to a less degree. The older growers will remember that there are recurring periods in which mottle leaf and yellowing of the foliage, accompanied with much die-back, occur and that after a few years it disappears again and for a time all goes smoothly. These periods will be found to correspond with periods of low rainfall and the consequent accumulation of alkali in the soil. Most all of our irrigating waters contain more or less alkali. In evaporating this leaves an accumulation in the soil. It may be an apparently slight amount, but in the aggregate after many months of accumulating it does often become sufficient to make trouble. If the winter rains are sufficient to cause a run off, the soluble alkalies are carried off, but in years like last year, for instance, there is not enough rain in each storm to cause a run off and at the end of the season the accumulations of the previous year are still in the soil. This process repeated several years in succession is bound to make trouble for trees that are not alkali resistant.

The writer has heard some talk by successful growers about the necessity of filling the ground up with water during the winter to prevent June drop. Undoubtedly a good practice. But is it not possihle that of even more importance than the supplying of sufficient moisture to great depth is the washing out of the alkali? If this is the case, it is not only desirable to run enough water in the winter time to moisten the soil to great depth, but an actual run off is needed. The deep irrigation will merely carry the alkali to lower depths, whence it will again come to the surface by capillarity with the water. But with sufficient water to run waste water off the ranch, soluble salts of alkali go along and the soil is cleansed.

We have laid much stress on the folly of running much waste water, because of the losses of fertility, which is true if the water has been allowed to cause erosion, but have we not lost sight of the fact that we can save water so as to accumulate deleterious salts in our soils?

The obvious remedy is to use the water available in the winter time to rid the soil of this enemy of citrus trees. The present time is the time to do this. We have had two years of sparse rainfall. Thus far this winter has not been better. In most sections of the South the rains have not been sufficient to run any water off. "They have come so gently that the water has all soaked in." This is very nice, but it does not rid the orchard of alkali. This may cost a little extra, for pumping water from wells is expensive, but we believe it is money well spent.

Avocados at Yorba Linda

By Ernest Braunton

THERE is a favored section in Orange County, centering about the village of Yorba Linda, that is as nearly frost free as any section. While in general it is like much of the foothill districts, the land is more broken, and small ranches are found where there is no evidence of frosts visiting even the most tender plants.

No matter what their private interests, all the avocado growers are a unit in saying that there is no better proven commercial variety to date than the Fuerte. Others well known are named and will be listed, together with some first grown and named at Yorba Linda, the budwood having been brought from Guatemala. The most successful grower to date, judged by financial returns, is J. T. Whedon, who has but two or three acres now in bearing, trees six years old, but next year an extended acreage will commence to yield a crop.

Mr. Whedon was asked to name the best five varieties from his point of view, based upon experience. That is, not necessarily a list for the average commercial grower, as will be explained later. His list was: Sharpless, Fuerte, Spinks, Dickinson, Taft. Mr. Whedon explained his entire crop is contracted for, as in years past, by a leading Los Angeles hotel, and such trade demands the largest sizes and will pay the prices. His trees are nearly all Fuerte and in every way satisfactory. The few Sharpless trees he has bear larger fruits though much fewer.

Asked by the writer if a tree of each planted side by side would at the end of five or six years bear the same total in weight, Mr. Whedon answered that the Fuerte would far outstrip the Sharpless, perhaps two to one, but the larger variety would bring the most money from the hotel trade only. So the rest of us will give Fuerte first place. Each man, therefore, has his private list of favorites. The remainder of the varieties named are general favorites and good ones to plant, but someone experienced will urge slight objections to each, as they all do. It is believed the Fuerte will stand at least three degrees more of cold than the others named.

Another Grower's List

Dr. Lester Keller, on the other side of town, has nine acres of hillside and hilltop orchard with 600 trees in 40 varieties, not all of which have yet borne fruit. Dr. Keller expressed himself as satisfied with Mr. Whedon's list, but when pressed for one based on his own experience named a list somewhat different. Fuerte, Sharpless, Spinks, Puebla, and Dickinson have done best with him in the order named. The Puebla is a thin skinned fruit of purple color when ripe, the only thin skinned variety thus far named, for they are not seriously regarded by the growers on a large scale. It is the largest of its type and thought to be a hybrid between the Mexican and Guatemalan types. It is of good flavor, seed fairly large, an excellent home sort, as the writer can testify, having eaten many. It is also the only thin skinned variety recommended by the California Avocado Association. So let us plant a tree for home use.

New Varieties

H. H. Knight will give you another list and add the caution: "Bide a wee, and let us see." For Mr. Knight spent some years right in the midst of the wild avocados and when he came to California and found avocados growing in favor he slipped back to Guatemala on a still hunt for the best varieties. When he returned with budwood he wore a self-satisfied smile which up to date he still holds. He budded his new sorts into seedling trees and has an orchard that for size of trees is remarkable for four years of age. His varieties are yet untried except by a few growers and no official report has yet been made upon them, though some are the largest yet grown in the local field. The list includes Linda, Queen, Knight, Rey, and Kist, the latter the newest. Other growers believe the Queen and Linda are best in order named, but Mr. Knight says, to quote Browning, "Grow old with me, the best is yet to be."

There are other growers in that section, but of lesser acreage or younger orchards. Nearly all about Yorba Linda are growing a few trees for home use and many are of varieties not herein named. Some bear inferior fruits, some bear light crops, others will not grow but remain strangely

"First Again"

"And it's all because I learned how to use Hercules Dynamite to help me with my work. There's no use talking, you've got to have *good trees* to produce prime fruit. And the best way to have good trees is to *start 'em right*—plant 'em in holes blasted with

HERCULES DYNAMITE

"Then, too, I cultivate my bearing orchards by blasting between the rows. You should try that stunt with that old orchard of your's. It's better than plowing because it loosens the earth *clear up to the trees* without injuring the trees themselves.

"Send to the Hercules Powder Co. for their 68-page book, 'Progressive Cultivation'—they will send it to you free. This book tells you how to plant trees, dig ditches, clear your land of stumps and rocks, break up subsoil and do many other things with the help of explosives. Better send today, Jim. You can't start using dynamite too soon."

Hercules Dynamite can be bought at leading dealers'.

HERCULES POWDER CO. 1033 Chronicle Building, San Francisco, Cal.

Gentlemen: Please send me a copy of "Progressive Cultivation."

OUR Catalogues

For more than 35 years we have been issuing a fruit and ornamental tree catalogue. Horticulturists everywhere have come to look upon these annual books as real practical planters' guides, for they contain a lot of good information that is invaluable for the grower to have.

Our new 1920 Catalogue and Price List is now ready. It will be mailed to you free on request.

We grow about everything that grows in the way of trees, shrubs, vines, roses, berries, etc.

We pack our nursery stock so it will reach its destination in perfect condition.

We are always glad to hear from prospective planters.

Fancher Creek Nurseries

208 Holland Bldg. **Fresno, Calif.**

California Cultivator

Costs Only $1.00 Yearly

THE BEST SOURCE

of Nitrogen for Citrus Fruits is

Nitrate of Soda

because of its instant availability as plant food. Growth is promoted immediately after the application is made.

It is taking chances to apply any Nitrogenous Fertilizer which is not Immediately Available as food for plants, because of the tendency to unduly prolong growth and to delay maturity. It is also fatal to apply high-grade fertilizers too late.

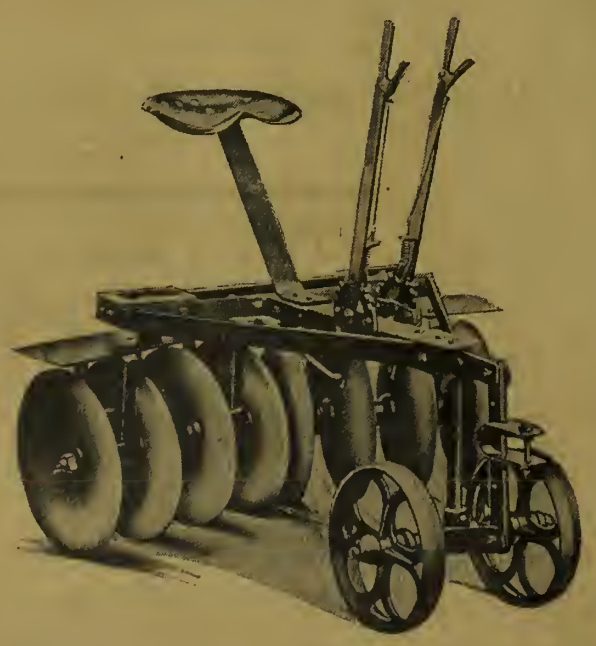
In California, on alkaline soils or soils having alkaline tendencies, apply Nitrate of Soda with an equal quantity of acid or superphosphate. This combination will tend to diminish any black alkali present.

Chilean Nitrate Committee

231 Douglas Bldg. Los Angeles, Cal.

DISCS FOR EVERY PURPOSE

In Price, Real Value and Utility No Implement Compares With the Davenport Reversible Disc Harrow



Every feature of our Discs is worked out carefully for California conditions. Cut illustrates our popular small reversible disc made in 4, 5 and 6 foot sizes with or without tandem or front trucks. Just the implement for small acreage, truck gardens and orchards. You can't beat it for the money anywhere, or for utility. We also make field and tractor discs for all purposes.

Davenport Implement Co.

Manufacturers and Dealers in Implements for California Conditions

Permanent Location—110 North Los Angeles Street

Los Angeles California

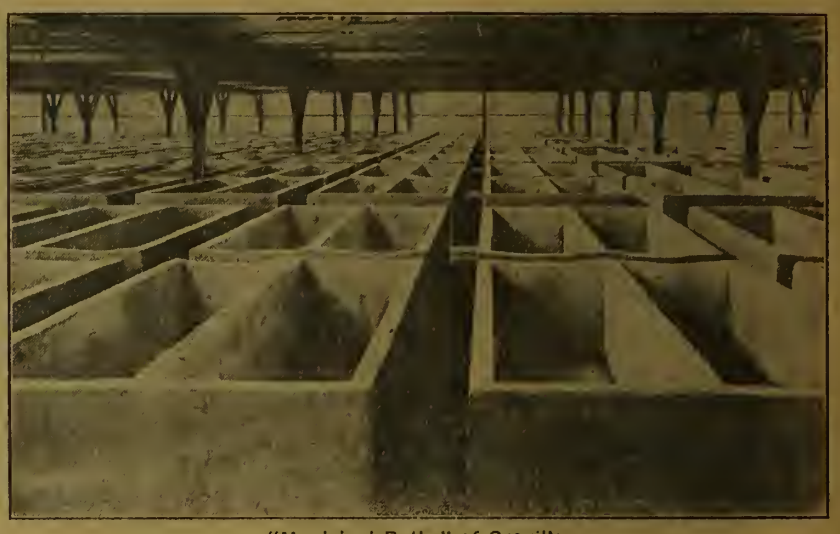
dwarf. Certain varieties have seeds out of proportion to size of fruit and some trees are short lived, dying after three or four years of fine crop production. The Dickey is one of the latter class and none should plant it. All experienced growers warn the public that a fruit is not of necessity ripe because it is mellow. A ripe fruit should become soft enough to eat in one week after being picked. If it goes more than two weeks it was picked too green and all avocados should not be judged by such immature specimens.

HAVE A HEAD AND USE IT

(Continued from Cover Page).

growth which was slightly headed back the next year when we cut away another quarter of the main limbs. This plan was repeated for five or six years as limbs too small to cut away the first year became large enough after four years more growth.

"My old orchard is now renewed with bearing top varying in age from one to five years. This orchard has often made 1,000 tons of green fruit of good quality. For the last four years it has yielded an annual crop of nearly 1,000 tons and promises another bumper crop, as the buds are large and thickly set all over the trees. Most of it is on apricot root from my own nursery and of the Royal variety. Last year was the first time it ever had any irrigation water."



"Municipal Baths" of Oroville

A section in the vat room of the Mt. Ida Packing Company. There are 1100 of these small tubs or vats which have a capacity of 500 tons of olives at one filling. They may be used twice, some of them three times during the season, so that the seasonal capacity is in excess of 1,000 tons of California processed olives. And this plant is only one of several in Oroville.

USE OF ALKALI WATERS FOR IRRIGATION

In February, 1918, at the citrus institute held in San Bernardino, Dr. W. P. Kelley of the University of California gave an address on the deleterious effects of some of California's irrigation waters. As he remarked in his prefatory talk, he did not wish to cause anybody undue concern, but felt that the matter was worthy of being brought to the attention of California orchardists.

That article appeared in the California Cultivator of July 12 and 19, 1919, and caused some comment, and we note now that the matter has been taken up by the Utah agricultural college, which has issued a bulletin upon the use of alkali waters. It is written by F. S. Harris and N. I. Butt. The opening statements of the bulletin as given in the first two paragraphs are:

Because of the scanty rainfall of arid regions, the soluble materials in the rocks and soil are not leached out as they are where the rainfall is high. As a result, the accumulation of excessive quantities of soluble salts is likely to be a menace to arid soils. Farm practices must be directed toward preventing this condition.

One possible source of contamination is from irrigation water which may carry in solution large quantities of soluble salts. Water passing over or seeping through alkali land gradually dissolves the alkali which it retains in solution. Drainage water coming from land that is high in soluble salts should therefore be thoroughly examined before being used for irrigation.

After discussion covering nearly 40 pages the following summary of the findings is given:

Since there is more land in arid regions than can be irrigated with the available water, it becomes necessary to utilize all water that can be obtained. This means that water containing large quantities of soluble salts is sometimes used, but if the salt content is too high crops are killed and the land is ruined. It is very important, therefore, to know the highest salt content that can be safely used.

In this paper the important literature on the subject is reviewed and the results of several experiments by the authors are given.

So many factors enter into the toxicity of alkali that it is impossible to give definite limits of salts in irrigation water. The nature of the soil, its drainage, the kind of crop, the amount of water necessary to apply to produce crops, the soil moisture content, the methods of handling the soil, and a number of other factors enter into the problem.

In experiments herein reported, the dry matter produced, the height of plants, the number and weight of leaves, the number and length of culms, the number of heads and spikelets, the turgidity of the plants, and the general appearance of the crops were all found to be useful indicators of the effect of alkali water.

Results in different soils show that wheat should not be irrigated with water containing as much as 1,000 parts per million of sodium carbonate and that even 500 parts per million will, in a short time, reduce the growth of the crop. More than 1,000 parts per million of sodium chloride and more than 4,000 parts per million of sodium sulphate proved to be harmful after two or three years. A mixture of the three salts—sodium chloride, sodium carbonate and sodium sulphate—was not so harmful as the most toxic but was more toxic than the least toxic individual salt. More than 4,000 parts per million of the mixed salts proved to be dangerous. Dilute concentrations of the salts often stimulated plant growth.

On land irrigated with alkali water for only one year, or with but a single irrigation, much stronger concentrations than mentioned above could be endured; but for regular irrigation water, any concentration above about 500 parts per million of sodium carbonate, 1,000 parts per million of sodium chloride, 4,000 parts per million of sodium sulphate, and 4,000 parts per million of the mixed salts may be considered as dangerous.

Temporary control for the common house fly costs the United States annually $12,000,000; $10,000,000 for screening the houses and $2,000,000, for "fly-traps," "sticky paper," "poison paper," etc. This is like placing a bucket under a leaky roof to catch the drip when it rains. Let us mend the roof and do away with the bucket. Proper disposal of refuse from the kitchen, hen house and barn, will remove the breeding places and materially assist in the control of this pest.

Observations on a number of vegetable seeds over a period of years has shown that the majority of them germinate and grow well when several years old, thus showing that seeds grown and harvested under favorable conditions may retain their vitality for a number of years.

Fruit at Your Kitchen Door

THE ideal fruit garden or home orchard should contain several different kinds of fruits, represented in many cases by a considerable number of varieties ripening one after another over a long period. Large yields, good shipping quality, and attractiveness in appearance, which are aims of the commercial grower, may be made secondary to high dessert quality or special excellence for cooking purposes.

The home fruit plat should be planned carefully and, in general, with a view to supplying fruit continuously throughout the year either in the fresh state or canned or otherwise conserved. Throughout a large part of the country one may grow in the same garden, if he so desires, the following fruits: Apples, pears, peaches, plums, cherries, quinces, strawberries, raspberries, blackberries, dewberries, currants, gooseberries, and grapes. In the warmer parts apples, currants, gooseberries and certain varieties of several other fruits fail because they are not adapted to the long hot summers and mild winters. But in these warmer regions, Japanese persimmons succeed, and figs and certain other fruits can be planted successfully. Therefore, one of the most important features of the plan for the home fruit plantation is the selection of kinds of fruits and varieties of those kinds which will do well in the given locality and which will serve best the purpose for which they are desired.

The location of the land on which the fruits are planted, other things being equal, should be convenient to the house. It should be well drained, since fruit trees cannot thrive in poorly drained soil. The air drainage also must be good. Cold air settles to the lowest levels, and if a site is so located that cold air settles over it from some surrounding higher elevation, the fruit blossoms are likely to be killed by untimely spring frosts or the fruit may be injured by freezes in the autumn when sites located on the sides of slopes or at points which are higher than the surrounding area escape such injury.

Most fruits can be grown on a great variety of soils, but where possible it is better to avoid light sandy soils and heavy clays. A deep subsoil, which is friable and porous enough to permit a ready penetration of the roots and a free movement of soil moisture, is desirable.

Good nursery stock of suitable kinds and varieties is fundamental to success in fruit growing. While many of the long established nurseries sell their stock largely through agents whose integrity is unquestioned, many other nurseries have no traveling agents, but sell direct to purchasers. It is better, as a rule for a grower to deal directly with a nurseryman than through an agent.

If the prospective planter prepares the soil where his fruits are to stand as thoroughly as he should prepare his garden before planting vegetable seeds, the subsequent growth of his trees will amply repay him. Where the site selected is in sod, it is advisable to cultivate it during one season at least after the sod is plowed under, in order that the grass roots may decay before the fruits are planted.

Where the fruit plantation occupies a garden site, usually it should receive about the same tillage that is given a vegetable plat. In the popular mind this represents a high standard of excellence. Frequent tillage to maintain the surface soil in the condition of a fine dust mulch is preferable in most cases to any other method of treatment. The tillage of fruit trees should be continued until midsummer in the North, but it may be kept up to good advantage somewhat later in the South. Strawberries, as a rule, should be cultivated until the approach of cold weather.

Under most conditions the same methods of maintaining the fertility of the soil which are followed in a vegetable garden are successful with fruits.

POWER and PERFORMANCE

GRANT SIX

Most cars perform well on the level. The test of power is what a car will do on a long, tedious hill climb. That is where reserve power counts and that is where you feel a keen sense of delight if you drive a Grant Six, for this car has power in reserve; more power perhaps than is necessary for ordinary driving—but it is just that EXTRA POWER that makes the Grant Six show so remarkably well on hills.

The Grant Six overhead valve motor takes this car as fast as most men dare to drive. Its flexibility is so marked as to excite comment. It is quick on the getaway and it will slow down to a walk with a steady, even, vibrationless pull.

It is no secret that through the use of both annular and roller bearings, by the use of highest grade universal joints, and by the most effective lubrication of all working parts, Grant Six power losses through friction are practically nothing. It is this fact, in connection with its light weight, that makes possible its very satisfactory performance under all conditions.

Four body styles to choose from — Five passenger Touring Car; Three passenger Touring Roadster; Five passenger Sedan; Four passenger Coupe.

Write for new illustrated catalogue and name of Grant Six dealer in your community.

TEAGUE'S
QUALITY
Citrus and Sub-Tropical
Fruit Trees

Are the best for Home or Commercial Planting

Teague's Citrus Trees

Are known throughout the Citrus Growing Sections of the World as the best that can be produced. Having recently taken up the growing of Sub-tropical fruits, it will be our aim to give this department of our business the same careful attention that has made our Citrus trees so well and favorably known.

AVOCADOS

We have for Spring delivery budded trees of the leading thick skinned varieties, such as the Fuerte, Spinks, Blakeman, Dickinson, Sharpless and Puebla.

FEIJOAS

We have a fine stock of grafted trees of the large fruiting varieties.

Also Cherimoyas, Sapotes, Guavas and Loquats

Our latest price list is yours for the asking.

Make big money spare or full time. Our easy selling plan makes experience unnecessary. We start you without money. Sample sent for 10 days trial and **GIVEN FREE** when you become a distributor.

Grafted Trees Long Lived

By F. D. Garrison, Tennessee State Horticultural Society

Often we hear people make the remark that the grafted and budded trees of today are not nearly so hardy and do not live to such age as the seedling trees of a generation or two ago. Granting this to be true, we wonder if they have tried to find out the reason why and have set themselves to work to help nature in her effort to stamp out the wrongs, correct the mistakes and summon whatever forces there may be toward the development of longer lived, hardier trees and more nearly perfect and delicious fruit.

When our grandparents and great-grandparents were setting their first fruit trees, occasionally in the very heart of the mountain fastnesses, they came upon great old apple trees. The seeds of these were probably dropped by some lone traveler as he climbed the dim mountain trails, little dreaming that from the hills and valleys where he then stopped to hear the occasional call of wild birds there would in future years come the merry voices of rosy cheeked children as they bore baskets of fruit in harvest time. Far be it from us to think of robbing these trees of their just praise and tender sentiment, or of dimming or marring any of that almost sacred love and reverence with which we look back uopn the old home orchard planted by grandparents or great-grandparents. But in justice to our trees of today let us bear in mind a few conditions.

As a general rule only a limited number of trees were in each of these old orchards, and as the orchards were widely separated, diseases or the spread of diseases would necessarily be less evident. Today we have not only our small home orchards to be considered, but there are also thousands upon thousands of acres of commercial orchards with infinitely increased numbers and kinds of insect pests, fungous diseases and bacterial infections, many of which have been imported into this country within the last four decades. Blotch and bitter rot have cost the United States in a single year the total of $12,000,000. Until these are relentlessly fought and controlled, we shall still have short lived trees. In many instances we have worked contrary to nature and made mistakes in selecting the proper stocks and scions or the improper varieties for different localities.

With proper care and attention there is no reason why budded and grafted trees will not be as long lived as old time varieties. The earliest definite history of a grafted tree is a Summer Boncretien, from Europe, planted by Governor Stuyvesant at New Amsterdam in 1647. The trunk of this tree remained standing in New York City on the corner of Third Avenue and Thirteenth Street until 1866, when it was broken down by a dray running over it. Here we had a grafted tree standing at the ripe old age of 219 years. This seems to us to prove that the longevity of a tree is not necessarily determined by whether it is grafted or a seedling.

MAY GROW ALL OUR FIGS

It is not improbable that this country will soon produce all the figs it needs. This statement is made by the chief of the bureau of plant industry in his report on the progress of Smyrna fig culture in California. Much of the success of this enterprise has been due to the fact that the department has been able to maintain a caprifig orchard at Loomis, from which caprifigs have been distributed free to growers. Before this distribution was arranged for many small growers of Smyrna figs became discouraged and some even dug up their orchards. The relationship between these two varieties is that the Smyrna fig is fertilized by an insect which lives on the caprifig. When Smyrna figs and caprifigs are planted together the caprifigs do not bear enough fruits to caprify the crop properly until several years after the trees begin to bear. For this reason a young orchard is dependent on importing the needed caprifigs during the first few years. It was to supply this need that the fig orchard at Loomis was leased by the department. Many new varieties of caprifigs have been brought to light, some of them very important in commercial Smyrna fig culture. Many thousands of seedling figs have been distributed to cooperators in the fig growing regions of California, Arizona and Texas, and some promising new varieties have been originated by a proper selection of male pollen.

In the fall of 1917 the fig insect was established in some old seedling caprifig trees in Brunswick, Georgia, and since then a number of caprifig trees have been similarly treated. The result is that it has been possible to caprify and bring into bearing many sterile Smyrna fig trees growing in the Southeastern States. Some of these trees bear a very high grade of fruit, promising for use as fresh fruit or for canning. It is still doubtful whether figs can be grown in the Southeastern United States to advantage in a commercial way, but it is a matter of much interest and of some economic significance that many old sterile fig trees in this region are really Smyrna seedlings. Approximately half of the trees are Smyrna figs, and the others are caprifig varieties.

* * *

The above is taken from a report of the department of agriculture, and while a little credit is given to California as the fig producer of the country, there is a hint that the southeastern part of the United States will not be a great factor in production of a commercial fig crop. We take it the blastophaga, or "fig insect," was taken from California. When all is said and done, we think it will be proved that California's great central valley will be the country's fig producer.

WHITEWASH YOUR TREES

Winter injury shows in several forms—sour sap, winter die-back, killing of the inner bark, mostly at the surface of the ground, unhealthy stock, and devitalizing effects. Young trees are especially subject to injury, largely on account of imperfect ripening in the fall. This may be due to excessive vigor resulting from very favorable conditions; to tender growth following injudicious summer pruning; to debility from various unfavorable conditions, such as excessive drouth in fall and early winter; or to early frost killing the leaves before the twigs are fully ripened. The injury results largely from drying out of twigs and invisible starting into growth by winter sunshine.

A good coat of whitewash reflects the heat instead of permitting it to be absorbed by the twigs, so that the interior of the whitewashed twig remains cool. The whitewash thus prolongs the winter rest period and lessens evaporation. Great care should be exercised to guard nursery stock from drying or excessive wet and from the slightest frost. In addition to whitewash, very tender plants will need protection such as wrapping with tules or cornstalks, mounding up the earth, etc. Wherever possible young trees should be irrigated now unless rains have fallen before this is published.

A good whitewash can be made as follows: Quicklime, five pounds; salt, one-half pound; sulphur, one-fourth pound. Slake the lime slowly with water and add the salt and sulphur while it is boiling. Add enough more water to make a good wash. The trunks and so far as possible the whole tree should be covered.

THE PERSIMMON

I. J. Condit is the author of Bulletin 316, "Kaki or Oriental Persimmon." The bulletin may be had by writing Agricultural Experiment Station, Berkeley. We quote the first paragraph:

"The kaki or Oriental persimmon was introduced into California about 1870 and is now to be found to a greater or less extent in nearly every county in the state. The tree is easily grown, is free from serious diseases and insect pests, and is in most cases

A Quality Combination

THE **International 8-16 Kerosene Tractor** is a tractor of character and personality. The first note of appeal is the graceful, trim design, the general compactness and the good balance of the tractor, with just the right distribution of weight on the front trucks and drive wheels. The next thing that strikes you is the absence of exposed working parts; everything is enclosed as protection against the grinding action of dust and dirt.

And you are impressed by the flexible range of the drawbar, making it possible to pull a harrow, plow, binder or wagon with equal advantage and by the convenient pulley so placed that the tractor can be backed into the belt in a hurry, with no chance for the belt to drag on the ground or rub against any part of the tractor.

And coming down to more technical but nevertheless very important details—there is the throttle governor that regulates the fuel to the load; removable cylinder sleeves in the engine so that if a cylinder should become scored through the use of poor lubricating oil, for instance, a new lining can be put in at once, renewing the cylinder; centralized auto-type control, making this tractor as easy to handle as an automobile.

These are only a few of the desirable characteristics of the **International 8-16 Kerosene Tractor.** The catalog that we have ready to mail you will give you the rest. Or, see your International dealer and examine his sample 8-16 for yourself.

exceedingly prolific. The fruit is very attractive in appearance, ships well to both local and distant markets, and is almost universally liked if eaten in the proper condition. Why then has the persimmon remained one of our minor fruits rather than taken its place among the leading fruits as it has in Japan? Various reasons may be assigned for its lack of popularity, chief among which are the following: the general lack of knowledge among consumers as to the value of the fruit and its proper condition for eating; the failure of the growers and the marketing agencies to advertise the fruit and educate the public in regard to its proper use; the grower's lack of attention to the subject of varieties, pollination, natural and artificial ripening; the failure of growers to develop the industry in by-products such as dried persimmons. There is little doubt that persimmon culture can be made a much greater industry in California if some of the points just mentioned are carefully studied and understood."

PROCESSING THE JUJUBE

At the time of the recent state fruit growers convention at Chico the delegates made a visit to the Plant Introduction Gardens. After an inspection of the orchard of jujubes the delegates were all invited to the home of the superintendent, R. L. Beagles, where Mrs. Beagles served delicious "Chinese dates" or jujubes. We have asked Mr. Beagles for information as to curing and have the following letter:

In regard to the processing of the jujube, our method is to pick the fruits when they are firm and well colored on the trees. They are put over a pricking machine so as to perforate the skin, then boiled one hour in a solution of sugar and water, one cup sugar to one cup of water. After the boiling they are laid out to dry. When sufficiently dried, they are then in a condition to be packed for use. This is the process which we have followed for several years: in fact, it is the only one I know of being used.

CAULIFLOWER IN CALIFORNIA

(Continued from Page 123)

have at least half a hundred horses, the hay does not leave the ranch.

These growers have much improved several standard makes of implements used on the ranch, but H. E. Williams has perfected and patented a seed sower that has revolutionized the business, for the saving over the old method is as ten to one. Heretofore the sowing has been by hand drills, a row at a time, and all other operations were separate. The new machine plows the furrows, smoothes and packs by wooden rollers, and plants, covers and firms the soil of four rows. Lettuce, which is the crop now being planted, is sown in double rows on ridges, and this machine makes perfect and uniform work, which also simplifies cultivation and harvesting. As indicating the expense connected with the vegetable industry, Williams Brothers let the contract for thinning this lettuce crop for $14 an acre.—E. B.

HOME FRUIT GROWING EXPLAINED FOR BEGINNERS

Well ripened sound fruit is healthful. It is also a valuable food. It should form a part of every meal, fresh when possible, or dried, canned, or otherwise preserved. Home grown fruit is desirable because it reaches the family fresh and in the best possible condition. Because the family has fruit of which it would be deprived if it had to be purchased. Because, if the proper varieties be selected, a continuous supply of fruit of superior quallty may be secured, regardless of market prices. Because any surplus may be sold without difficulty, or may be canned, evaporated or otherwise conserved for use when fresh fruit is not available. Because the care of the home fruit garden provides for spare time congenial and profitable occupation which is in reality recreation for those who enjoy seeing things grow.

Information that will be of practical help to the beginner in fruit growing is furnished in concise form in Farmers' Bulletin 1001, "Growlng Fruit for Home Use," recently lssued by the United States department of agriculture, Washington, D. C.

Heider
No Gears to Strip

Think of the freedom from worry, delay and expense! By the Heider Patented Friction Drive the power is taken directly from the flywheel by two big discs—forward and reverse. Clutch transmission and bevel gears all done away with.

Rock Island One-Man Outfits
Heider Model D 9-16 with No. 9 Rock Island C T X two-bottom Power Lift Plow directly attached. Below, Heider Model C 12-20 with Rock Island No. 19 C T X two-three bottom Power Lift Plow. Foot-lever control. Automatic power lift.

The Heider Has 15 to 20% Fewer Parts

More power goes into pull—steady, flexible power, as much or as little as you need. The superiority of Heider construction is proved on leading farms in every part of the country by

12 Years Actual Field Work

That is the answer to every argument. For 12 years it has done every kind of traction and belt work. Its great reputation for success is built strictly on performance. You do not have to take a demonstration of one or two days as your guaranty. Ask any owner.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

San Jose Scale

I have Delicious apple trees covered with light colored scale and they die down to the roots. Will you tell me what the trouble is and what spray should be used for the scale?—Subscriber, Long Beach.

This seems to be a serious infestation of San Jose scale. Secure at once commercial lime-sulphur solution and dilute according to directions, presumably about nine gallons of water to one of the solution. Owing to this being a serious infestation we believe we would give a second spraying somewhat later.

Redwood for Trays

I have some redwood which I am figuring sawing into shakes and drying trays. Is there a market for apple boxes and packing boxes of redwood? —Subscriber, Visalia.

Redwood would not make desirable orchard or packing boxes, at least it is scarcely ever used for that purpose. It is too easily split and does not hold nails as does pine. We have known of trays being made of redwood shakes, but white or sugar pine is usually preferred. The best information in this line would be to get in touch with the California Peach Growers Association, Fresno; Associated Raisin Company, Fresno; California Prune and Apricot Growers Association, San Jose, or other large dryers of fruits.

Cleaning Oil Tank

Can you tell me how to treat a galvanized iron tank that has been used for storing smudge oil so that it can be used for a water tank for domestic use?—Subscriber, Santa Ana.

We fear this would be a hopeless task. The only suggestion we would have would be liberal use of caustic, possibly preceded by thorough swabbing out with gasoline. The operator should bear in mind, however, that poisonous gases generated in these tanks where these oils have been stored make it necessary to use great precautions in entering them.

Manure Pit

I am thinking of building a manure bin in my corral to keep manure for fertilizing. What would you suggest as the best size to build and what material would be the cheapest? I believe they are mostly made of cement but would it be advisable to make one out of something else? About what would it cost to build one of cement, and would one get enough benefit on a 50 acre orchard to pay for putting one in to save from two or three horses? Also would it be better to put it close to the stable under the eaves so rain would run in the manure or should it be placed some other place?—Subscriber, Simi.

If the orchard is near the stable we would by all means distribute as fast as the manure is made. This is quickly and cheaply done by drawing the "stone boat" with high sides next to the stable and throwing in the manure as fast as made. As soon as filled or at convenient season haul to trees and distribute. In any case do not leave under the eaves during rainy season. The loss from leaching would be a serious matter. If it could be worked into the soil with disks soon after distributing, it would be well, though the loss from evaporation is slight, that is, excepting where there has been subsequent moisture to cause it to heat, which drives off the ammonia which is rich in nitrogen. Where there are a large number of animals the cement pit with drainage so that liquid may run away to tank and be distributed directly in the orchard is desirable, but with a few animals this expense would not be justified.

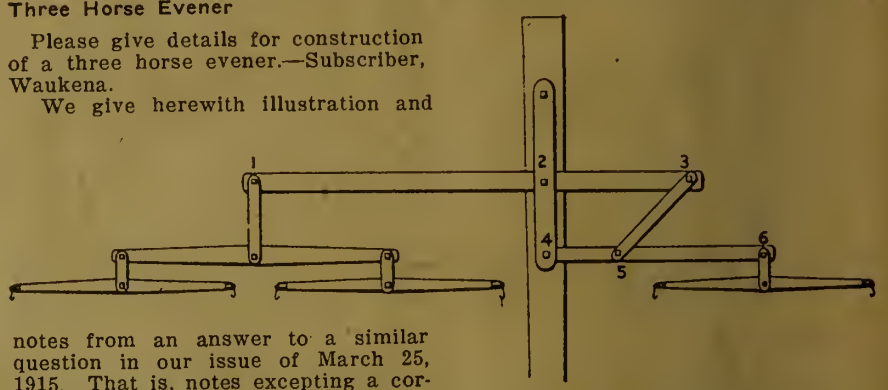
Three Horse Evener

Please give details for construction of a three horse evener.—Subscriber, Waukena.

We give herewith illustration and notes from an answer to a similar question in our issue of March 25, 1915. That is, notes excepting a correction furnished to our paper by A. M. Jones of Modesto. We also give an explanatory note added by Mr. Neff:

"Two feet from 1 to 2; one foot from 2 to 3; two feet from 4 to 6; eighteen inches from 5 to 6; six inches from 4 to 5; six inches will do from 2 to 4. Get your pieces straight and measure distance from 3 to 5. Have square holes cut in irons for bolts, so they can be easily removed. In this cut the nigh horse walks next to tree; should you wish to drive the off horse next to the tree, you can reverse the plan. You must place the double tree part back six inches from the place where you would hitch two horses, or shorten traces. I am using one on a disk and do not notice much side draft."

This was submitted to J. B. Neff, and he writes: "The load at 3 is twice that at 1 and consequently the load at 5 in twice the load at 1. If one horse is to handle this load against two horses at 1 the horse at 6 must have a leverage of four times the distance from 4 to 5. If this is six inches then the lever from 4 to 6 must



be two feet long. Any desired length of evener can be used by remembering to have the ratios as stated above."

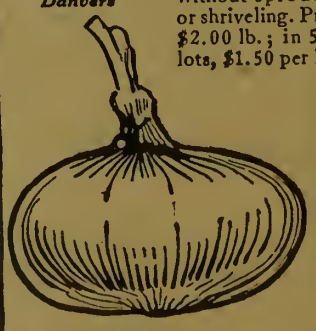
Walnuts in Northwest

An out of the state subscriber wishes information as to possibilities

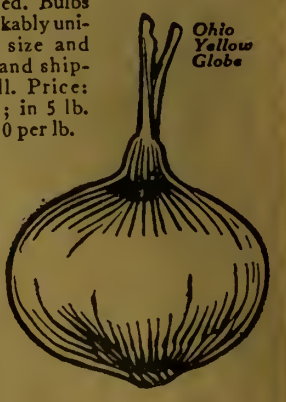
Right now is the time to get onion seed because the time of planting is at hand. And remember: C. C. Morse & Co. are onion seed specialists. You can rely on Morse's seeds to grow and produce; true strain, soil-tested! Here are three varieties we particularly recommend:

Australian Brown, a very early, hardy variety; does well in California. Should be planted early on low, wet ground. Skin is thick; color a rich brown. Keeps late into the spring without sprouting or shriveling. Price: $2.00 lb.; in 5 lb. lots, $1.50 per lb.

Ohio Yellow Globe is the best of the yellow varieties. Skin is bright, glossy orange-yellow; the flesh is white and fine-grained. Bulbs are remarkably uniform in size and shape; stand shipping well. Price: $2.50 lb.; in 5 lb. lots, $2.10 per lb.



Yellow Danvers is the best known of the yellow flat onions; extra hardy and a heavy yielder. Bright orange yellow; flesh white and firm. A standard market variety. Price: $2.25 lb; in 5 lb. lots, $1.75 lb.



Order all your seeds from Morse at once and make ready for planting. Write today for quantity quotations on the seeds you need. Write today for the 1920 Garden guide, a practical manual of Pacific Coast planting. It will help you—and it's free. A post card mailed today brings it.

C. C. MORSE & CO.

Operators of the World's Largest Seed Farms

733 Front Street, San Francisco

Morse's Seeds are obtainable in 5c packets where you do your trading

of growing walnuts in Idaho or Wyoming. This question was referred to J. B. Neff who answers:

There are but few extended areas in the United States where the Perslan walnut will succeed and produce profitable crops. These are almost wholly on the Pacific Coast and close enough to the ocean to be under the influence of the coast winds. Varieties may be developed which will be adapted to the inland conditions, but we do not have them now. The varieties now grown commercially requlre a long growing season with the absence of late frosts in the spring and early frosts in the fall. However there are walnut trees growing in many of the states and under conditions whlch are very unfavorable but unfortunately we have no records of production, though we are often told they are producing crops. There are a few large trees in Washington, District Columbla, one of the largest being in the capitol grounds. Numerous individual trees are to be found in Maryland and in southeastern Pennsylvania. There are some small orchards near Lockport, New York, and trees at Rochester, New York. Some planting has been done in southern Indlana. Very few trees are found in Washington east of the mountalns and the same may be said of Oregon. The varlety grown in western New York would be more likely to succeed in the colder states than any that are grown in Californla.—J. B. N.

Seed "Novelties"

Here is an advertisement which I have taken from daily paper advertising novelties in seeds of fruits, vegetables, etc. Are these of any value and should one invest at these large prices? Think thls is the same advertiser that put out the "butter bean" a few years ago.—Subscriber, Oroville.

The novelties advertised in the clipping sent included "vegetable peach," "preserving melons," etc. Regarding these we have no knowledge and if of same style as the butter bean offering, which as the subscriber suggests was nothing more than a gourd, it is well to pass them up. Where one wishes to keep in touch with latest novelties there are usually offerings made in the catalogues of established and responsible seed houses. These are usually offered for what they are worth and their true name may be given to them. Like gambling, if one has time to throw away a little gardenlng with these might be harmless.

Slobbers

My rabbits seem to have something seriously the matter with them. They at first appear to be sleepy then the nose runs and after a day they begin to foam at the mouth. Some of them have already died. What is the cause and what can be done to remedy the trouble?—Subscriber, Saratoga.

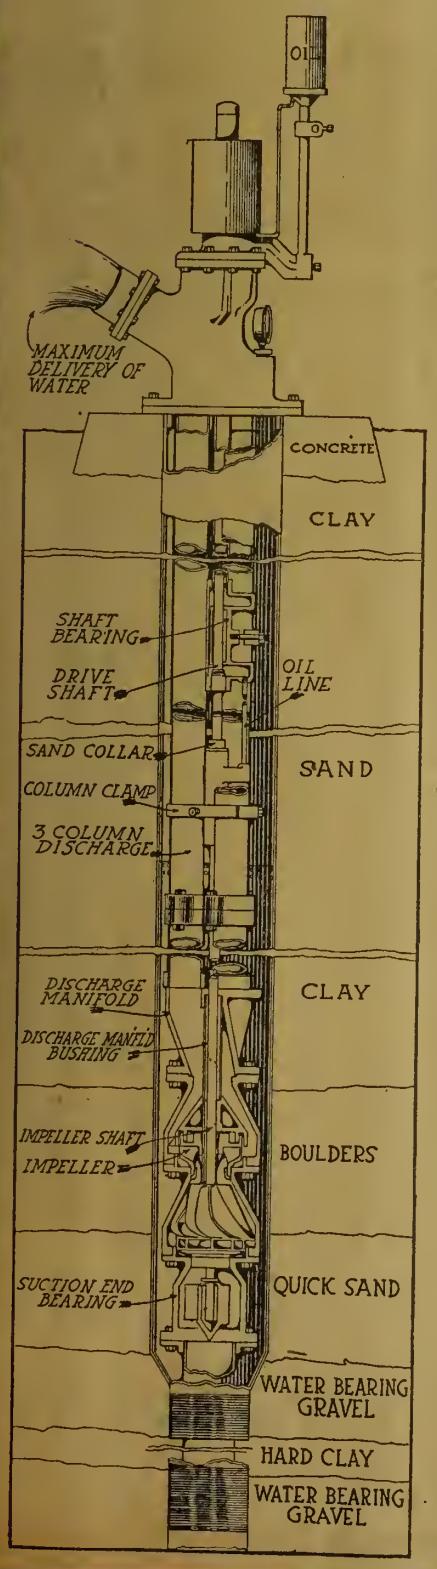
This may be a severe cold; more probably it ls slobbers. We refer the subscriber to the article written by Mr. White on page 493 of our issue of October 11, 1919. In a word: give thorough cleansing to hutches, prevent drafts and feed only dry clean hay with clean grain.

Bantams for Eggs

Would be greatly pleased if you could glve me some information about chickens. Have recently moved into town and have not a great deal of room for chickens, nor do I want to go to much expense for houses, etc., as I am simply renting. So I thought of bantams. Would lt pay to keep a few bantams for egg production? That is for a home supply? What breed ls the best layers? How much feed would they require in proportion to Leghorns? Do you know of any breeder near here? I enclose stamp for reply and thanking you for same.—Subscriber, Santa Rosa.

So far as I can learn, bantams are kept only for exhibition or as pets. Undoubtedly they do lay, and some of them, I know, lay quite well, but if you want merely eggs for the home table, you will find the little White Leghorn the cheapest blrd to keep. That, at least, is the reputation she bears. Six Leghorn hens, kept ln a covered wire pen six feet square or smaller, with a dry goods box to sleep in, and fed on dry mash, some kind of hard grain, and your table scraps, ought to keep an ordlnary family well supplied with eggs. You are in a great Leghorn district and should be able to pick up a few good layers at a reasonable price—J. A. K.

BEAN Turbine Pumps do NOT infringe upon any patent



Important NOTICE

Bean Spray Pump Co. has always respected the rights of others as represented by the ownership of patents.

Bean Spray Pump Co. themselves owners of a number of valuable patents do not manufacture any machinery that is in any way an infringement of the patents of any other company.

No suit has been filed against Bean Spray Pump Co. for infringement of patents, and no suit can or will be filed because Bean Turbine Pumps do not infringe upon the patents of others.

No purchaser of a Bean Turbine Pump or other Bean machinery has ever been sued by anyone on the ground of ownership of machinery infringing upon the patents of others because Bean Turbine Pumps are not an infringement of patents belonging to others.

Bean Deep Well Turbine Pumps are the product of a careful, painstaking organization of pump builders having had many years of experience in the manufacture of pumps of all types.

Different water levels or varying water levels, together with other causes determine the kind of pumping plant that may be profitably installed, and the experience we have gained through constant application to the problems met in the process of irrigating in the West, qualify us to be of real service to the man who has irrigating problems to solve.

Because we manufacture and have for sale all types of irrigating machinery we are placed in a position to recommend and install the kind of plant that is best adapted to the needs of any particular person. We are not forced to recommend and sell one type only.

Our Turbine Pumps are the product of careful engineering, they slip into the well with full control at the surface. No pit, no loss of priming, no valve troubles. This method of installation guarantees a minimum of pump troubles. The pump may be lowered in the well, if this becomes necessary, without the trouble, danger and expense of lowering the pit.

The Bean Deep Well Pump being built with three discharge columns, arranged and clamped together in the form of a triangle, with the drive shaft being held firmly in bearings each 5 feet along the whole length of the pump from the bowls to the discharge head, forms a peculiarly rigid type. Any strain or bend that might occur is distributed along the whole length of the pump rather than in one place.

The drive shaft not being placed in direct contact with the discharge, water is protected in this manner against the sand that is carried in suspension in such water, and which would, were it allowed, cut out the bearings.

Each bearing (placed at five foot intervals) is provided with a flanged collar placed above which prevents any sand or grit entering the bearings, through the medium of water that might come into the well from above.

The Bean Turbine Pump is accessible—perhaps the most accessible deep well pump ever made. If the necessity should arise to get at the pump, or if the water level lowers and you are forced to put in an additional section, you can do it by pulling the pump up one section only, breaking it at this point by taking the nuts off of six bolts, unscrewing the drive shaft, inserting gaskets and a new section, taking up the six bolts again, connecting oil line and drive shaft, and the pump is ready to lower in the well again.

Simplicity and accessibility are valuable features in a turbine pump and they are pre-eminently Bean features.

Investigate this Bean Turbine Pump. Many of them have been installed. Let us send you our literature showing some of our Turbine installations. Twenty years of pump experience is your guarantee of satisfaction.

THE successful farmer raises bigger crops and cuts down costs by investment in labor-saving machinery.

Good prices for the farmers' crops encourage new investment, more production and greater prosperity.

But the success of agriculture depends on the growth of railroads—the modern beasts of burden that haul the crops to the world's markets.

The railroads—like the farms—increase their output and cut down unit costs by the constant investment of new capital.

With fair prices for the work they do, the railroads are able to attract new capital for expanding their facilities.

Rates high enough to yield a fair return will insure railroad growth, and prevent costly traffic congestion which invariably results in poorer service at higher cost.

National wealth can increase only as our railroads grow.

Poor railroad service is dear at any price. No growing country can long pay the price of inadequate transportation facilities.

Out of accumulated capital have arisen all the successes of industry and applied science, all the comforts and ameliorations of the common lot. Upon it the world must depend for the process of reconstruction in which all have to share.
—JAMES J. HILL.

This advertisement is published by the Association of Railway Executives.

Those desiring information concerning the railroad situation may obtain literature by writing to The Association of Railway Executives 61 Broadway, New York.

About Tractors and Trucks

By James De Camp

SEVERAL years ago the mere ownership of a tractor was a mark of distinction. Today they are more numerous and commonplace than profiteers or amendments to the peace treaty.

Tractor operation has developed a science all its own. Stated simply, the problem is merely this, to get the most results with the minimum expense for fuel, upkeep and time. The fellow who would not take the trouble to apply a little gray matter to his tractor problems dropped out of the game long ago. The farmer who has puzzled out short cuts, time savers and labor minimizing devices for his particular conditions is reaping returns from the most ravenous market the nation has ever known.

A practice now followed on many large California ranches is that of towing a trailer carrying drums of fuel, water and lubricating oil and a supply of cup grease, tool kit and other necessities to the field where the tractor is to work. Thus tanks may be replenished and repairs and adjustments made in the field with a minimum loss of time. When leaving for the scene of the day's work the tractor can tow its own garage, moving the equipment about at will as needs dictate.

When working upon a schedule that calls for the utilization of every minute some operators rush the game along a bit by descending from the machine on long, straight stretches and making the rounds of the grease cups and oil holes while the outfit is in motion. This, of course, is not feasible with plowing, but works out very nicely with harrowing, dragging and similar operations.

Ten hours of work per day with the consumption of 25 gallons of distillate, one gallon of cylinder oil, five gallons of crude oil and five cents worth of cup grease is the average reported by S. A. Stanley who is operating a large, caterpillar type tractor on land leased by Henry Boos near the Pasadena Sewer Farm. This acreage will be devoted to growing vegetables for Boos Bros. cafeterias.

Mr. Stanley and his tractor hire themselves out for agricultural work of all sorts and have become the best of pals. The owner claims that but one hour per week is required for tightening up the mechanism and making adjustments. During last year this outfit plowed 1,085 acres; subsoiled 44 acres, leveled for 40 days and worked down, disked and harrowed 62 acres. This work was completed with no mechanical expense except the replacing of a bearing which burned out because of clogging of the oil pump.

A scraper operated by air pressure from the driver's seat on the tractor is a feature of Mr. Stanley's equipment. These outfits consist of an air compressor attached to the tractor proper with a hose connection to the pressure tank on the implement and are designed to be operated by a laborer riding on the scraper. In this instance an ingenious control, much like the air brake applicator on a street car, has been rigged up convenient to the right hand of the tractor operator. Thus the wages of one man are saved and the unsatisfactory shouting of directions above the noise of the motor is eliminated.

Owners of caterpillar type tractors state almost universally that their chief source of trouble is clogging of the tread. This bother can practically be eliminated if a few minutes are devoted each day to inspecting this important part of the machine. Some makes provide tanks to feed crude oil to the tread as it revolves and present a barrier to dust and grit. If these are allowed to become empty or run low trouble is inevitable. The tractor tread is similar to the horse's feet or the automobile's tires. Occasional inspection and attention are a positive necessity.

Several transfer and motor trucking concerns have added livestock trailers to their truck equipment and are advertising that they have the facilities to take animals to market. This is a coming business. Direct loading of stock from barnyard and direct delivery to market cannot be compared with the railroad method of waiting for a load to be made up and then running the risk of underfeeding and costly delay and paying extra delivery charges at the other end of the line.

A Great Power Project

Under the war demand for fuel conservation the hydraulic engineers of the United States geological survey served in a field study of power problems.

A power survey of the United States was begun, and at the end of the war Secretary of the Interior Lane asked of congress two appropriations, one of $50,000, for continuing this power survey over the whole United States, and the other of $200,000, for an intensive survey of the industrial zone of the East, where power requirements are most congested. At present in the central power plants of the country water power carries only about 40 per cent of the load, while the total fuel requirement for steam-generated power, including that of the railroads, is not less than 800,000 tons daily. A power program that calls for the immediate and full development of every available and feasible water power, moreover, means saving both in coal and in man power, and with this purpose of securing the double conservation, the investigation has been proposed. The first step is to get the facts for the country as a whole and particularly for the North Atlantic industrial district.

This "super-power" project, which engineers agree seems wholly practicable but which can be regarded as now only in the vision stage, is to pool the power supply for the whole industrial area between Boston and Washington, in which is concentrated one-fourth of the power-generating capacity of the country. Such a unified power system would tie together properly located steam-electric and hydro-electric plants—old plants that are efficient as well as new plants—in a great power main from which would flow the energy to serve a score of railroads, hundreds of public service companies, thousands of mills and factories, and millions of homes.

The subject is necessarily one for interstate investigation and is linked with the national problem of providing adequate transportation facilities. Electrification of our railroads would effect fuel economies of more than 50 per cent in coal consumed, not to mention the greater efficiency of electric traction through increasing road capacity. Equally important, moreover, is the relation of cheaper power to American industry. As stated by Secretary Lane in a letter transmitting the estimate for this appropriation: "Only by increased economy in the production and distribution of power will it be possible for our manufacturers to decrease their production expenses and compete successfully in the world's markets, maintaining at the same time the American standard of wages and living."

LIGHT BURNING IN CALIFORNIA FORESTS

That the forest service is unalterably opposed to the practice of "Piute forestry," or the so-called light burning of timberlands at frequent intervals, is stated emphatically by Colonel Henry S. Graves. California, according to the chief forester, appears to be experiencing a wave of propaganda for "Piute forestry," a term given to the frequent burning over of timberland because this practice was followed by the Indians many years before the advent of the white man.

"The advocates of light burning," said Colonel Graves, "claim that by burning the woods every few years the forest will be kept clean of inflammable debris without injuring the merchantable timber. Hence serious conflagrations which, fed by such growth, underbrush and litter, run

into the tree tops and kill the large timber supposedly would be rendered impossible. As a matter of fact this process of repeated burning, beginning back in the Indian days, has steadily depleted the forests.

"There are today nearly 2,000,000 acres of land in the national forests of California which were once heavily timbered but now have been reduced to barren brush fields by fire. This is not the work of one fire, or a few fires, but of repeated burnings, extending over 50 or 100 years.

"It is impossible to fire the pine woods of California on any extended scale without destroying with every burning at least a considerable portion of the small growth and at the same time eating out little by little the butts of the old trees. The next fire, whether following in one year or several years, extends this destruction. Every traveler through the Sierra is struck by the openness of many of their pine forests, by the patches of brush encountered everywhere from which trees have disappeared. Many a fine sugar or yellow pine has been burned out at the base until the wind toppled it over. 'Piute forestry' was steadily wiping out these forests until they were placed under federal protection.

"The practical results of protection may be seen on hundreds of thousands of acres of pine forests in the federal holdings, where fires have been kept out successfully for 12 or 15 years. These areas afford a striking contrast to the 'clean' land where light burning has been practiced. Instead of there being no vestige of young growth, the open spaces have been filled with thickets of pine saplings. In these forests future timber crops are assured. This is the kind of forest which the state of California needs for the protection of its irrigation and water power sources, for insuring a perpetual supply of lumber for its intensive agriculture, and for safeguarding its whole economic and industrial future. California can have such forests if no quarter is given to the light burning idea and all interests get behind a real program of fire protection."

DWARF GRAIN SORGHUMS

As the result of long continued experiments in the production and improvement of grain sorghum varieties in the dry and elevated portions of the southern Great Plains, the United States department of agriculture announces the following conclusions:

Many varieties produce well in favorable seasons. Only well adapted varieties produce well in the less favorable and in unfavorable seasons, which comprise about three-quarters of the total number.

Earliness is the most important single factor in the varietal adaptation of grain sorphum crops to the conditions obtaining on the high plains of the Texas Panhandle.

Dwarfness is the next most important factor in the adaptation of these crops.

The combination of earliness and dwarfness is extremely efficient in insuring adaptation to environmental conditions which include frequent periods of drouth.

Dwarf milo, Dawn (dwarf) kafir, and Sunrise (early) kafir are well adapted varieties.

Dwarf milo and Dawn kafir are meeting with wide approval on the farms of the high, dry plains.

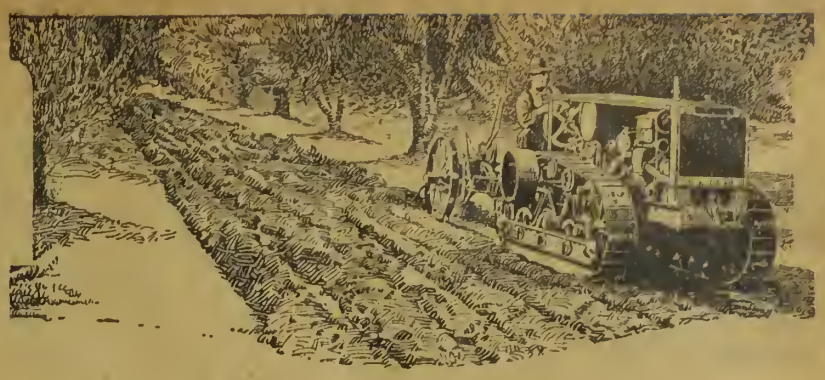
Germination and stand are governed largely by local conditions at sowing time.

Tillering, or the production of suckers, is a varietal or group character to some extent. In part, it is correlated with stand and seasonal conditions.

The production of erect heads is largely a group or varietal character, but is influenced by the same factors as tillering.

The eggs of the tent caterpillar are deposited in masses around the small branches of apple trees and the winter is passed in this stage. Watch for them while pruning your orchard and cut out these egg masses and burn them. This will prevent future loss and effect a complete control.

The most effective method of controlling the melon or cucumber aphis is to destroy the infested plants as soon as the pest occurs.



Grip on the Ground

There is a feature of the Monarch Tractor which puts this machine ahead of all competitors. This is the traction—the actual grip on the ground—which gives the maximum of drawbar pull to the amount of engine power developed.

Monarch Tractors not only give the farmer traction but they give wear because they are constructed of tough wear-resisting Manganese Steel. The tracks on the Monarch Tractor are covered by a broad and full guarantee. Your insurance against their wearing out.

In every part of the world Monarch Tractors are giving the type of reliable service, which makes the tractor a paying proposition. The hills are never too steep and the work is never too hard for the Monarch. They are the acme of combined power, ruggedness and mechanical ingenuity.

There is a Monarch Tractor for every farm, made in the following sizes: 30-18 H. P., 20-12 H. P. and 16-9 H. P.

Read what Monarch users have to say about Monarch Tractors. Our "Performance" booklet sent you on request.

TOP DRESSING TALKS

344% Increased Yield!

"THE plot to which Sulphate of Ammonia was applied produced during the three years of the experiment an average increase of 344 per cent. over the nearest cbeck plot." (Bulletin 163, Oregon Agricultural College Experiment Statlon, "Sulphur as a Fertizller for Alfalfa in Southern Oregon.")

This increased yield, amounting to nearly 6 tons of alfalfa in three years, could be attributed to the available sulphur supplied in the Sulphate of Ammonia. On an adjoining plot an equal amount of nitrogen from another nitrogenous fertilizer produced no increase.

Sulphate of Ammonia contains 1-3 more nitrogen than any other top-dressing, which with the sulphur gives double advantage in crop production.

Let us tell you how to top-dress orchards, vineyards, grain, meadows, cotton and truck crops for greatest profit.

Have You Seen The TRUNDAAR Tractors?

Do you know that it has not cost the users of Trundaar Tractors a dollar in three years for track expense? Trundaar tracks do not wear out. Are you aware of the fact that the Trundaar will work perfectly on steep hills where other tractors fail and will work equally well on any kind of soil?

Did you know that the Trundaar will turn in its own length and that it is impossible to make it rare up in front as many machines do and that it will adjust itself perfectly to any uneven ground? Is it any wonder why call it the tractor that will do anything? Last, it will do more work than any other tractor on the market sold for anywhere near the price.

Relative Resistance of Crops to Alkali

THE experiment station of the Utah agricultural college has issued a bulletin largely made up of charts showing relatlve resistance of various crops to alkali. The bulletin was written by F. S. Harris and D. W. Pittman. As noted, lt is mostly glven up to charts showing action of various crops under various percentages of different soluble salts, especially alkali, which is credited with being the chief limitlng factor in crop growth. From the summary, or discusslon of results, we quote:

Discussion of Results

These experiments show tests for 14 varleties of oats, eight varleties of wheat, three varieties of barley, rye, seven varieties of corn, three varieties of millet, five varieties of the sorghums, eight types of forage legumes, four varieties of beans, seven varieties of grass, five varieties of vegetables, sugar beets, buckwheat, hemp, flax, and rape.

On comparing the different varieties of oats, it is found that a considerable similarity exists in the resistance of the different varietles, Boswell Winter, Red Rust Proof, Black and Wbite Tartar, and Colorado No. 9 in the order named being more non-resistant than the othcr varieties. The lower concentrations of salts usually produced stimulation in growth. This stimulation contlnued up to about 1,000 parts per million of the chlorides, about 2,000 parts per million of the carbonates, and about 3,000 parts per milllon of tbe sulphates. When the concentrations were made higher than the amounts given there was a rather rapid decline in the yield and number of plants germinated.

The varieties of wheat showed about the same conditions that were noted between tbe varieties of oats, Turkey Red being the most resistant and Velvet Don the least. Elnkorn was slightly less resistant than most of the varieties of wheat. Of the tbree varieties of barley testcd, Black Hulless was most resistant and Utah Wlnter least. Only one varlety of rye was tcsted; this was among the most resistant of all crops undcr investigation. Corn began to show toxicity at low concentrations but some crop was produced even at the highest concentrations tbat were used. In comparison with most other crops, corn seemed to be affected relatively more by the chlorides than by the carbonates or sulphates. Mllets in general showed about the same resistance as corn, although German millet was less resistant than any of the corn varieties with the possible exception of White Rice popcorn. Of the sorghums, Collier's was most resistant and milo least. Milo was among the most sensitive plants tested wltb the exceptlon of some of the grasses. Halry vetch showed relatively greater tolerance for chlorides in comparison with other crops. The growth of alfalfa was prohibited by slightly lower concentrations than that of sweet clover. Neither of these crops shows unusual resistance in the seedling stage. Tbe larger seeded plants in general seemed to be able to germinate better In alkali land than the small seeded ones. There are, however, some exceptions to this rule. The growtb of beans was stimulated by small quantities of alkali, although growtb was entlrely prohibited at the higher concentrations.

Of the grasses under investlgation, the rye grasses were more tolerant than other varieties. Kentucky Blue grass was the least tolerant of all crops under investigation Orchard grass was only slightly more resistant. Rape showed much greater resistance for the chlorides tban for the carbonates or sulphates. If chloride was used as the indlcator rape would be placed among the most resistant crops, whereas if the carbonates were used it would be considered one of the most tender. Sugar beets on the other hand were stimulated by lower concentrations of carbonates but were affected very deleterlously by the sulphates and somewhat less by the chlorides. Kohlrabi showed great resistance for the lower concentrations of sulphates but was decidedly affected by even the lower concentra-

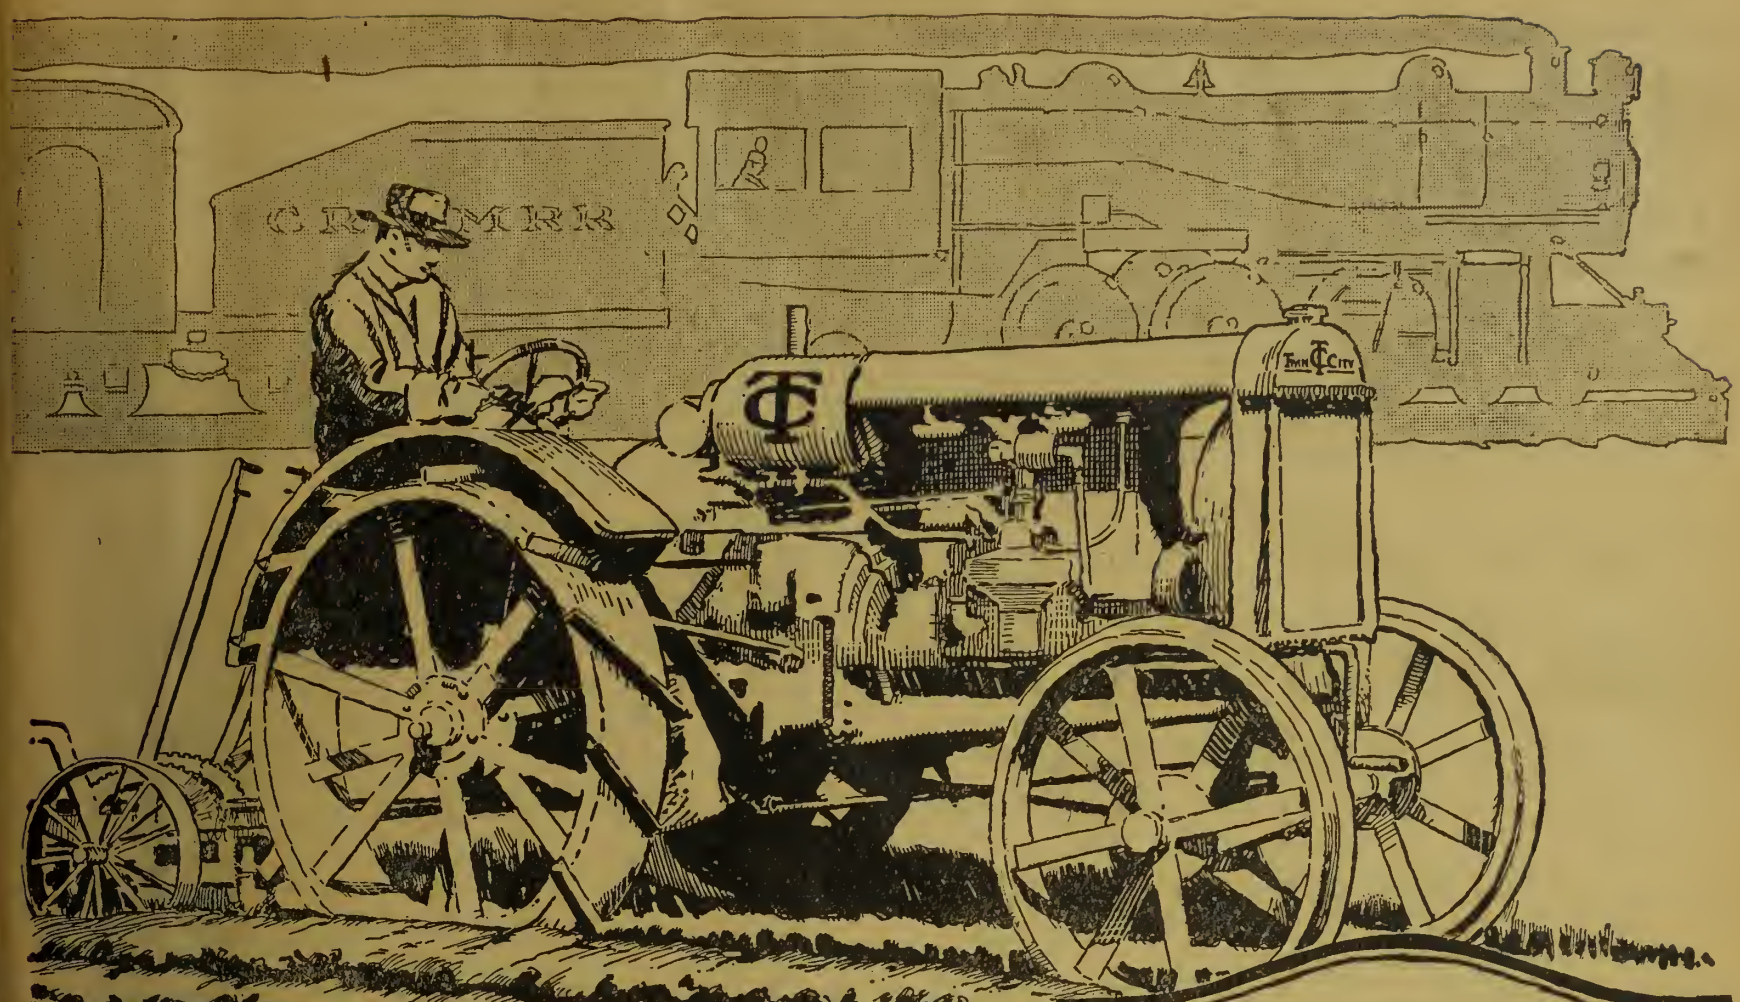
Frost Protection Scenes

While there has been no extreme freeze this season the weather has been so cold on many mornings that as a matter of safety many orchardists have started the heaters. The upper scene shows oil storage tanks near Claremont, Los Angeles County. The tower in background has been used in the making of observations by experts of the weather bureau of the department of agriculture. The lower roadway scene shows method of banking heaters along the upper side of the Willis Jones orchard near Claremont. Mr. Jones cooperated with the department experts in making observations which have been of great value to citrus orchardists.



Dependable as the locomotive

FIRST in six out of eight competitive tractor contests. Read the following, on fuel costs:

Average of all tractors in contests, 56.34 cents per acre; average of TWIN CITY in contests, 37.6 cents per acre.

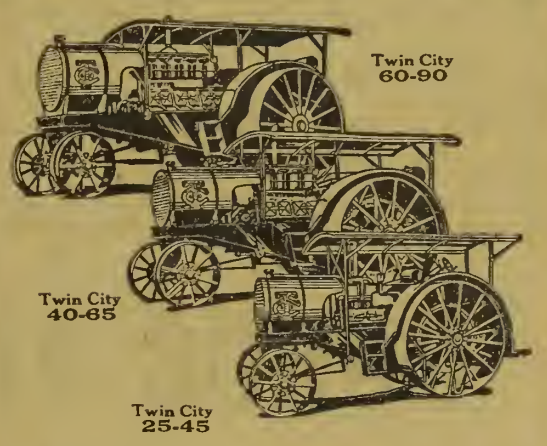
First of its type, the 16-valve-in-the-head TWIN CITY Tractor Engine carries much of the responsibility for this remarkable showing. Because this construction gives greater power, due to complete combustion, quick clearance of burned gases and rapid recharging of cylinders. Because of the economy obtained by perfect kerosene burning, without water injection.

Absence of vibration, hence longer life, is due to the counterbalanced crankshaft.

These features, recognized for years by engineers, produce the most powerful, economical and long-lived power unit.

Never before has the farmer had the benefit of these features in a tractor, on account of the extra high grade material necessary, the new manufacturing equipment required and the additional machine work involved.

In the TWIN CITY 12-20 you get them all—because it is built to do the work, not to meet a price. Write for full information on this most efficient tractor and the official proof from eight contests.



The great TWIN CITY Line of Tractors, with the addition of the new 12-20, now provides power for *all* farm work on any size farm.

Sale Ring Ethics

CALIFORNIA livestock interests should be congratulated over the fact that to date very few, if any, of the common practices that have been permitted to develop in the auction business in the older sections have been introduced in local sales. The Cultivator has always felt that there was no real reason why livestock sales should not be conducted on a dignified basis and we have never seen any real reason for using as many men in the ring as is often the custom in Eastern sales. Besides adding unnecessary expense to the breeders' cost of selling the practice adds confusion to the buyer who is really interested in the sale. Not long ago the editor of The Shorthorn in America commented on the number of "ring men" used in some sales and his remarks have been widely reprinted. With the hope that the suggestions offered may serve to steer some of our own breeders away from the practice we take the liberty to quote as follows:

"There is a growing impression that the methods employed in auction sales of pure bred cattle, in fact of all breeds of livestock, might be improved upon somewhat. A practice, originated nearly a score of years ago as an aid to the auctioneer when the crowds were large, has its usefulness, but it has also its limitations and objections. It is the practice of the use of ring men who solicit bids. As we say, this plan is not without its merit nor its shortcomings. With the expansion of the business the practice has become general on the theory possibly that if a little was good more would be better.

"Not infrequently now do six or seven men take their places in the ring for the purpose of soliciting bids. In some instances the ring is so small as to render it not only inconvenient for the men in the ring, but the procedure becomes inconsistent with the needs of the sale.

"We have in mind one instance where seven men worked in a space so limited that the bidders could scarcely get a view of the cattle offered. The confusion resulting from this number of solicitors who were energetically urging the crowd to 'come across' caused the sale to take on an aspect far removed from the ordinary conception of an auction.

"We recall that one of the bidders, a veteran cattle breeder, finally stood up and requested on behalf of the bidders and those who were interested in the success of the sale that a part of the 'selling force' in the ring be withdrawn and that those who remained proceed with less noise and confusion. His request was timely, for these had been frequent duplication and misunderstanding of the bids and the auctioneer in the box scolded the stockmen present for causing so much confusion, a condition that was caused not by the stockmen but by the solicitors in the ring.

"Perhaps this feature is a factor in disseminating livestock, but after a rather long experience and broad observation we are inclined to believe that it more often works to the injury of a sale. We do not question the motives of those who offer their services in this way. We know a number of press representatives who have repeatedly rendered useful service in the sale ring, and who acted upon the urgent request of those holding the sale.

"We are well acquainted with a number of auctioneers who are very proficient in this particular field of activity, but we also recognize that it is being overdone. The seller's interest and the buyer's convenience and purposes are in many instances alike jeopardized. Bids are often misunderstood.

"Two men claim the same bid and in the rush of the sale one or the other becomes irritated. Occasionally disputes arise, and all this makes for the injury rather than the benefit of the sale. It is important that the sales be conducted on an orderly plan. It is not desirable that bidders be urged beyond reasonable limits. A man may be a bidder and still be human. He may be obliged to remain within the scope of his credit. He may have well defined purposes. Perhaps he has a little judgment of his own.

"We heard this rather interesting comment recently concerning two auctioneers. In referring to one the speaker said, 'His trouble is that he knows values too well, and when an animal reaches or goes a little beyond its value he knocks it off, but the other auctioneer has little conception of values and consequently keeps on fighting for bids and is, therefore, of more value to a sale.'

"We will admit there is something in this, but in the main there is a limit to values, and there is always danger of causing disappointment and possibly ill-feeling when a bidder is urged too far. As a rule these efforts are good natured and are accepted in that spirit, but after all there is among our people a good deal of sentiment Courtesy plays its useful part, and there is a certain dignity about the business deserving recognition.

"These suggestions are not made with any attempt at criticism, but rather to aid in working out a plan that may be more popular and more appropriate. Our sales have been singularly free from the effects of the methods indicated—yet not entirely free. We draw into this business many men of broad business experience, and it is important that they should regard an auction sale in its true light and not gain the impression that bedlam prevails or that a man is liable to be 'bullyragged' or 'strong-armed.'

"We have purposely stated this rather in the extreme to draw attention to a practice which has its usefulness and its drawbacks. We recognize the need of a little check on this practice before it assumes larger proportions.

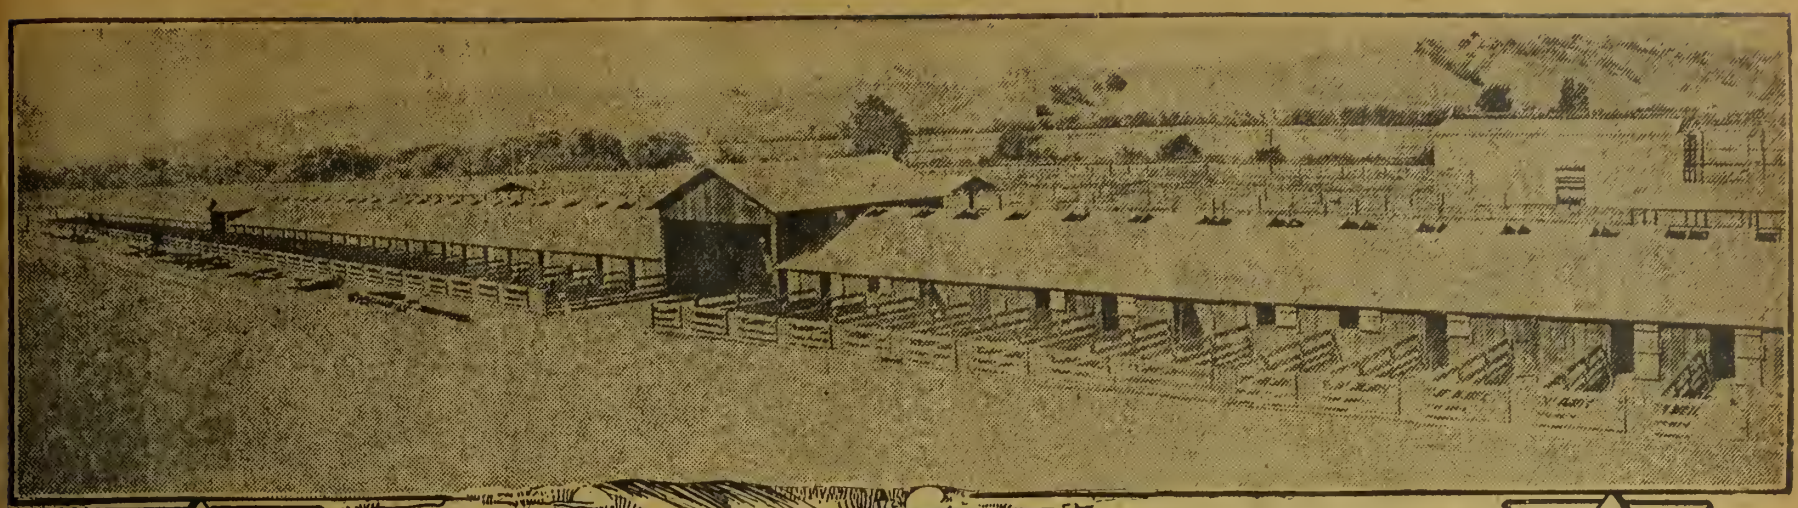
"We are confident that the auctioneers would be glad to see such an improvement brought about. We know the press representatives would be glad to be relieved of a rather arduous and strenuous task. We believe the bidders would welcome some little change in the methods. We realize that the seller's interest would be better safeguarded thereby."

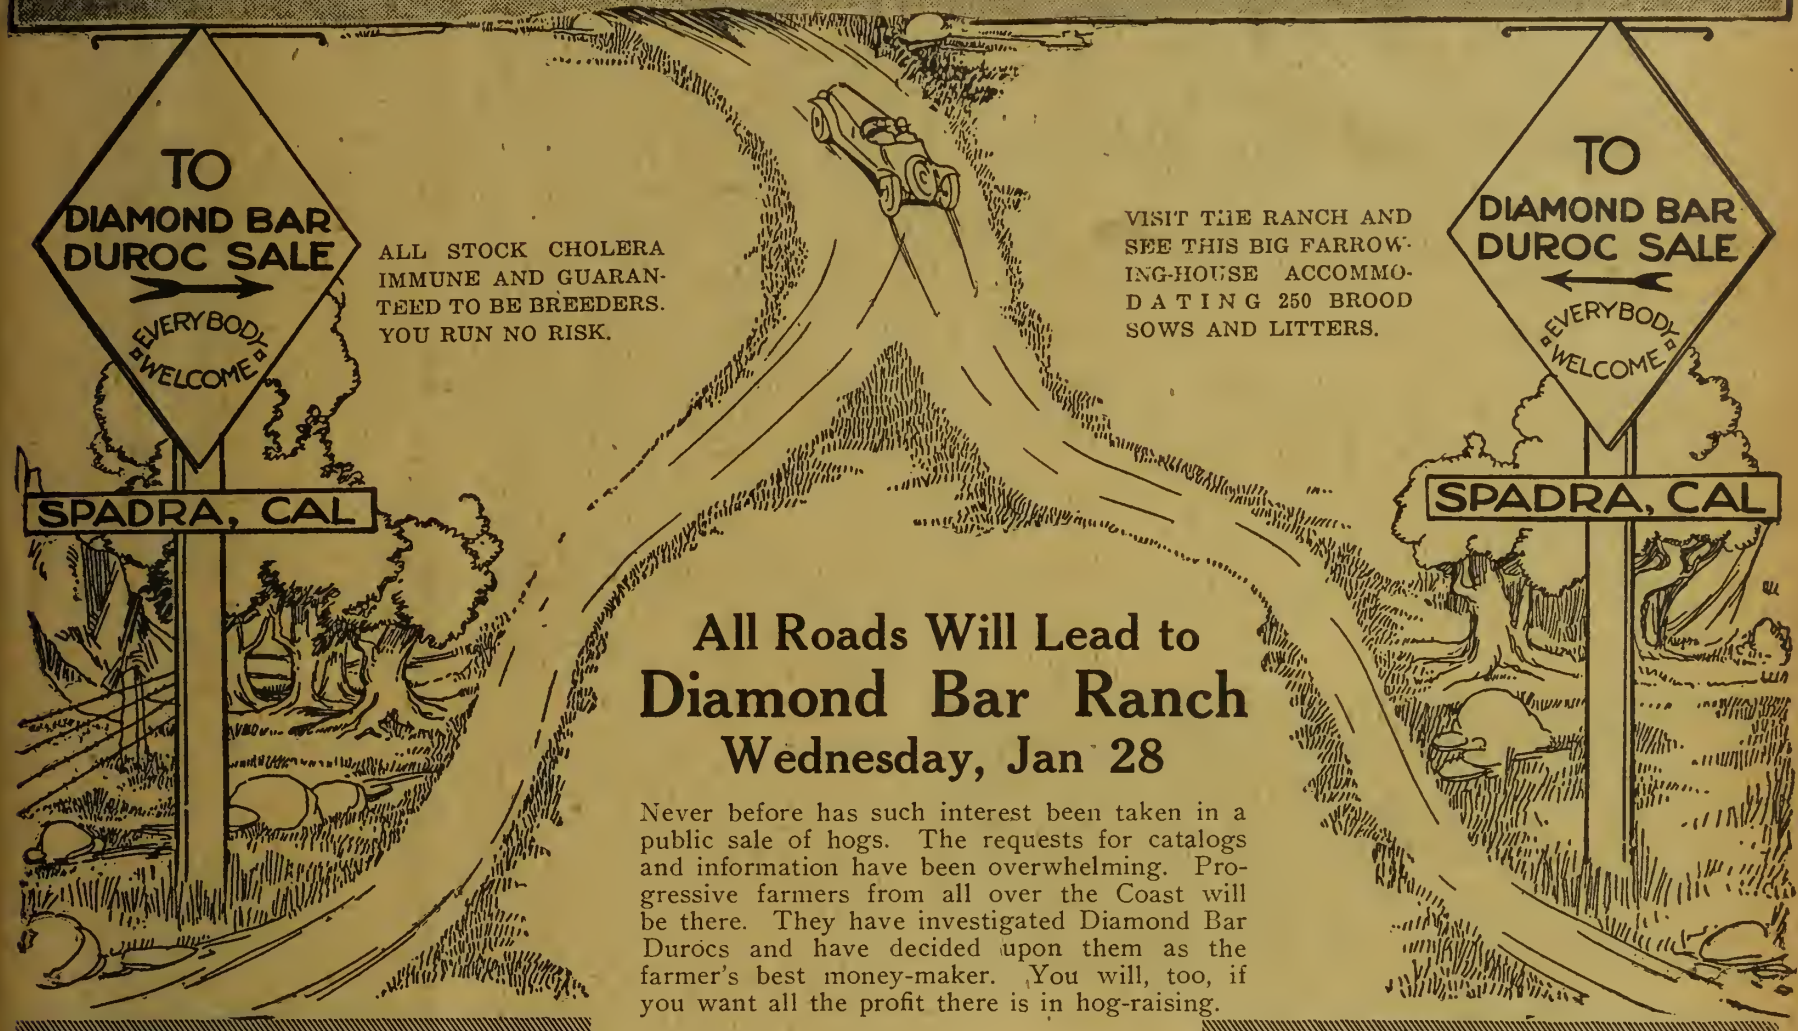
Along the same line, and suggested by the article just quoted, R. J. Evans, secretary of the American Duroc-Jersey Association, writing in a recent number of tne Duroc Bulletin, raises the question as to whether some Eastern breeders are running public auction or side shows. He says in part:

"We repeat what we have so often written—one good auctioneer who who knows something of his business, knows the breeders and knows something of values, is worth more than a dozen, and one assistant in the ring is better than more. We wish the breeders would just one year manage their own business. Figure out just what constitutes good business management of a sale, hire their auctioneer and contract for advertising on the same basis as would a good level headed business man. If the majority of breeders would do that just one season, there would be some candidates for other jobs than bleeding breeders of pure bred hogs. Who wants to sit at the ringside and have his eardrums cracked by a lot of ballyhooing, seesawing and unnecessary, noisy begging for the bidders to bid just once more?

"If men and women want that sort of thing they hunt it up at the carniva and the circus when their whole mind is free from business and noise is a part of the program. There ought to be more dignity to the public sale business, not only in the cattle rings but in hog auctions. They smack too much of boys' play and not enough of business methods employed in sales held on a higher plane.

"We need not sit with long faces as if at some obsequies, but there is a middle ground where men can meet at the ringside, their minds on a business transaction, the auctioneer and acting as if they were really human, the sale conducted quietly and earnestly, without the 'bullyragging' and 'strongarm' method. Truthful description of animals catalogued, followed by a dignified sale, where only legitimate bids are used, will in the long run net the seller more satisfaction and year in and year out add more to his bank account and his reputation as a breeder and a man, than





All Roads Will Lead to Diamond Bar Ranch Wednesday, Jan 28

Never before has such interest been taken in a public sale of hogs. The requests for catalogs and information have been overwhelming. Progressive farmers from all over the Coast will be there. They have investigated Diamond Bar Durocs and have decided upon them as the farmer's best money-maker. You will, too, if you want all the profit there is in hog-raising.

California's Greatest Duroc Sale

Here is your opportunity to get corn-belt stock at Coast prices. Do you know that the leading Eastern breeders are expecting to shatter all former records for high averages at their sales this winter? Why? Because they will offer Pathfinder, Sensation and Wonder stock—the kind that is in such great demand.

That is the breeding we are offering in our sale. There will even be litter-mates and half sisters to these animals that are establishing world records in both sale and show rings. Wouldn't it be good business for you to buy one of these sows bred to a champion boar and have the same blood lines in your herd? Then, as you read of these whirlwind records that will be made this winter, you can sit back and say: "They haven't a thing on me. I have the same breeding." Remember—every sow in this sale was sired by a champion boar and bred to one.

40
Bred Sows and Gilts

A Wonderful Offering

10 TWO YEAR OLD and SENIOR YEARLINGS—By Model Chief 2d, Model Triumph and Councillor.
10 YEARLING SOWS—By Pathfinder, Great Wonder I Am, Pathfinder's Wonder, A Top Pathfinder and Creator.

Fresno District
Duroc-Jersey Breeders Sale
FRESNO, CALIF.

Wednesday, Feb. 4 1920

-40-
"Regular" Bred Sows and Gilts
with Size, Bone, Conformation and Quality

The offering has been selected with care from the following herds:

Fitzwilliam Ranch, Burrell; J. P. Mallory, Fresno; Guy McClune, Fresno; J. W. Schmitz, Madera; J. G. Roberts, Madera; H. H. Bereton, Sanger; Harry Hill, Riverdale; R. H. Lewis, Riverdale and Hillcrest Farms, Caruthers.

Therefore this sale affords an opportunity to select at one time stock from widely separated herds. The management of the sale has been particular to catalog only such sows and gilts as was felt would be appreciated as representative of the best in Durocs. Special emphasis has been laid on size, bone, conformation and quality.

California Durocs at Chicago

The breeding represented in the offering includes sows and gilts either sired by or bred to the following well known California boars: Col. Golden by Col. the King, Crimson Orion Cherry King by Joe's Orion Cherry King, California Trailfinder by Col. Trailfinder, McClunes Preceptor by Big Preceptor, a son of Orion Sensation, Great Select by Orion's King E., Sunkist Winner by Big Preceptor and Hillcrest Wonder. Surely in such an array of bloodlines the wants and needs of any man can be taken care of.

There's a Reason for Raising Durocs!

1. Durocs fill every demand of the practical hog raiser.
2. Durocs are prolific.
3. Durocs mature rapidly.
4. Durocs breed uniformity in size, type, conformation and color.
5. Durocs are vigorous, hardy, good rustlers and good mothers.
6. Durocs are profitable.
7. Durocs outnumber any other breed.

The Sale will be held at
The Fresno Fair Grounds
Lunch will be served

all the padded bids and ballyhoo methods he can hire the auctioneers and fieldmen to use.

"Let us acquit ourselves as men pursuing a calling that has no superior if conducted on the right plan. Let our transactions be open and above suspicion. We will win in the end."

DUROC ASSOCIATION SALE A SUCCESS

The first consignment sale of bred sows and gilts to be held under the auspices of the California Duroc-Jersey Breeders Association was held at the university farm, Davis, January 14, and resulted in the fine average of $166.50 on the 36 head sold. The sale was organized as part of a broad plan of breed promotion work that the association has undertaken and the offering has been carefully selected from a number of the leading herds of the state. The sale was widely advertised with the view of inducing new men to take up the breeding of pure bred hogs and the large crowd in attendance indicated the marked interest that California ranchers are manifesting in better livestock of all kinds.

S. E. Whiting of Sacramento, who entered the Duroc business last summer, was the heaviest buyer, securing 16 head of the tops. J. P. Walker of Visalia secured the top sow, Big Queen, a granddaughter of Golden Wonder and out of a Chief Invincible dam consigned by F. M. Johnson of Napa, at $550. The same buyer also secured Pathfinder's Queen 2d, a February gilt by Pathfinder's Likeness, at $310. Whiting got Reggie's Delight of Mossdale, consigned by J. E. Thorp, for $355, the second highest price. Lincoln White of Sacramento took six head at good prices.

For the most part it was felt that the top animals could have fetched considerably more money in view of the bloodlines and individuality represented, but the consignors were generally well satisfied.

Col. Ord L. Leachman of Sacramento was the auctioneer.

CHANCE FOR DAIRYMEN

Burr Farm, Los Angeles, will offer at public auction Tuesday, January 27, at their farm, East 26th Street, Los Angeles, 100 dairy grade cows and 20 pure bred registered Holstein bulls. The bulls are all young, ranging in age from one month to one year. The sale starts at 9 a. m.

A DUROC-JERSEY DAY

The numbers of Duroc-Jerseys in the southern end of the state are indicative that that breed is becoming a great favorite south of the Tehachapi. One of the larger breeding ranches has been located near San Diego. It is known as the Winsor Ranch. The manager, R. K. Walker, spent much of last summer in different Duroc producing sections of the East and at this time he selected 86, all fine spring and fall gilts. Some of these, together with other home bred animals, will be offered at public sale January 29. The sale will be made at Exposition Park, Los Angeles. Regarding the offer, Mr. Walker writes:

"The sows are sired by such boars as Great Orion Sensation, Orion Sensation, Great Model, Great Wonder, Great Wonder I Am, Orion Fancy King, Grand Model 8th and Grand Models Type.

"The sale hogs will be bred to Winsor's Giant Orion, the largest boar on the Coast, and a boar which we think will be pronounced the greatest sire ever in the West when his pigs, now being grown out in several herds in the state, are shown at the fairs this fall. They are the extreme big type, but combine with their size feeding qualities that are exceptional for such large animals.

"Winsor's Giant Orion himself is sired by the world's grand champion Orion Cherry King Jr., who sold lately for $16,500 when over six years old. In winning his world's championship he defeated 11 state fair champions and grand champions.

"A few of the sows in the offering will be bred to Great Sensation 3rd, an outstanding fall boar by Great Sensation, and a few to the well known Winsor Ranch boar Great Model."

The world's record for milk production was dangerously threatened when Zarilda Clothilde 3d De Kol, a Holstein cow owned by Colony Farms, Essondale, British Columbia, completed a year's test in which she produced 33,153. pounds milk and 1,194.17 pounds butter. Tilly's record performance stands at 33,424.8 pounds milk and 1,332.25 pounds butter. The Canadian cow is the only cow in the world besides Tilly Alcartra to average 31,000 pounds of milk for three years.

John A. Bunting, secretary of the Pacific Coast Hereford Breeders Association, writes that the entries coming in for the fourth semi-annual sale to be held at the university farm, Davis, assure the highest class offering yet made in an association sale. About 40 bulls and 40 females will be consigned from the leading herds of California and Nevada. The sale will be held the last week in February and will be managed by the California Breeders Sales & Pedigree Company.

Ten Duroc-Jersey breeders of Fresno County will consign 40 head of bred sows and gilts to the sale to be held at Fresno February 4. Those whose herds will be represented are: Fitzwilliam Ranch, Burrell; J. P. Mallory, Raisin City; Guy McClune, Fresno; J. W. Schmitz, Madera; H. H. Bereton, Sanger; Harry Hill, Riverdale; R. H. Lewis, Riverdale; Hillcrest Farms, Caruthers. The Duroc is proving very popular in the Fresno district and it is expected that the forthcoming sale will serve to increase the interest.

January 6, Mousel Bros., Cambridge, Nebraska, sold 60 head of Hereford bulls and females for $265,800, an average of $4,430. Superior Mischief, a son of Beau Mischief, sold for $22,000, and the 25 bulls in the sale averaged $4,888. A daughter of Beau President, Bright Duchess 77th, topped the female division at $8,000.

In a sale of Herefords recently held in North Dakota, 121 head of bulls and females sold for an average of $1,011. A feature of the sale was the high average obtained for cows from ten to 17 years of age. Twenty-one cows averaging 12 years sold for an average of $1,280. Two cows 17 years old sold for $875 and $850 respectively. The top price was fetched by Petunia 26th, an 11 year old daughter of Paladin, that sold for $3,350. Beau Dugal, an eight year old son of Beau President, sold for $6,500; Beau Comrade, a six year old son of Beau President, sold for $5,100, and Beau Victory, another nine year old son of Beau President, sold for $5,300. The high average obtained was due to the fact that the older bulls and females were bred by Gudgeil & Simpson, the most constructive American breeders of Herefords, and whose efforts are more appreciated now than when their herd was in existence.

Alex. M. Wilson, superintendent of the swine department of the Italian Vineyard Company, Guasti, has purchased from E. J. Barker, Thorntontown, Indiana, 17 bred Berkshire sows, six open gilts and two young boars. Included in the lot were two boars and two gilts sired by Real Type; ten sows sired by Superb Emblem and one sow by Dukes' Champion 12th. Mr. Wilson secured Real Type's Lucindy 5th, first prize and junior champion at the 1919 Indiana state fair. Purchases were also made from the Lovejoy herd in Illinois.

Ed K. Brown, acting for Miller & Lux, has purchased six yearling Aberdeen-Angus bulls from W. B. Seeley, Mt. Pleasant, Iowa. The bulls will be used at the Dos Palos ranch.

On account of the large number of dairy cattle being shipped into Southern California to be sold and the difficulty in handling them, the firm of Rhoades & Rhoades of Los Angeles has leased the well known E. A. Rogers dairy ranch at Clearwater and is completing erecting stockyards capable of caring for 400 head of dairy cattle at one time. A sale pavilion is being built in order that all sales may be held under cover. Comfortable seating arrangements will be provided; in fact, every convenience for the buying public will be provided. Clearwater is in the exact center of the Southern California dairy district. Another important feature is the fact that the unloading pens of the Salt Lake Railroad adjoin the ranch, making it very easy to unload cattle. The Southern Pacific line to Compton is only three miles distant. Every facility in handling the cattle until time of sale will be rendered the seller. There are separate corrals with plenty of shade for each lot of cattle.

A. A. Jenkins of Tulare writes: "I wish to report the following sales of Jersey bulls, all made this past week. To Peacock & Good, Bakersfield, Gertie's Lad's Heir, a son of Gertie's Lad. This bull is a great individual. His full sister, Gertie's Lad's Rosy, has a record of 506 pounds butter with her first calf. To Mrs. Cora Townsend of Bakersfield a son of Gertie's Golden Victor and Ida Fern Smith, who is a granddaughter of Imp. Golden Fern Lad. To O. F. Collins of Tulare a son of Gertie's Golden Victor and Gertie's Lad's Foxy Marjoram, also a daughter of Gertie's Lad. This is a wonderfully bred bull, carrying as he does the blood of the great Gertie of Glynllyn on so many lines. He is also strong in the blood of Pedro."

One of the attractive sales of Polan Chinas that will be held next week is that of Hale I Marsh, Modesto. Mr. Marsh states that what is particularly pleasing to him is the interest being displayed by the farmer and dairymen, as indicated by the requests for catalogues. Thirty-five bred sows will make up the offering, and they will be bred to Big Model. Modesto King and Blue Valley Big Bone. Mr. Marsh has recently built a combination farrrowing house and sale pavilion on his farm and the sale will be held in this building.

The forthcoming sale of bred Duroc Jersey sows and gilts that will be held on Ireland Ranch, near Owensmouth, January 30, will be a combination sale selected from the herds of three breeders. Ireland Ranch will sell 30 sows and gilts, including Defender's Fancy S 2nd, a granddaughter of Cherry King, Cardinal Lady C and Ireland's Lady A, first prize six months pig at Southern California Fair. Donald H. Graham will sell three daughters of his premier herd boar Orion King Gano, while E. Avery Newton sells six daughters of Crimson Col

JERSEYS

3 BULLS	No. 1 born Mar. 1, 1919. Sire, Our Noble May-fair Hero.	3 BULLS
No. 2 born Oct. 1, 1919. Sire Our Kathie's Eminent.	All from high record cows in Arden herd.	No. 3 born Dec. 20, 1918. Sire same as No. 2.

ARDEN DAIRY CERTIFIED, EL MONTE, CALIF.

has been the aim of these three breeders to make this sale representative of their breeding herds and it is their opinion that the offering will meet the requirements of either breeder or farmer. Due to the position occupied in the Duroc-Jersey field by these three breeders, their offering will no doubt meet with a hearty response.

F. M. Johnson, one of the prominent Duroc-Jersey breeders of this state, has sold his farm near Napa and is now looking for a suitable location for his herd. Mr. Johnson has been responsible for bringing many high class Durocs to this state, and at the recent sale held at Davis he had the distinction of selling the top consignment. Five head of bred sows and gilts from his herd averaged $309.

V. F. Dolcini, June Acres Stock Farm, Davis, took advantage of the crowd of Duroc breeders attending the Davis sale and had his new boar, Choice Wonder 3d, on exhibition. Choice Wonder 3d was secured in Iowa last fall and was counted one of the best boars of his age to sell. California breeders expressed keen appreciation of the youngster, many declaring that he was the largest and heaviest boned spring boar they ever saw.

H. C. Witherow of the Greenwood Farms, Live Oak, attended the Davis sale and announced that he had recently purchased a half interest in Western Pathfinder from his owner, F. M. Johnson of Napa. Mr. Witherow has lately purchased additional land adjoining Greenwood Farms for his expanding Duroc business.

During the past 18 months El Dorado County has developed into quite a prominent Duroc-Jersey center as a result of the promotion work of Leroy J. Anderson, farm adviser of that county, and nearly 100 El Dorado County farmers attended the sale at Davis.

L. J. Whittier, a veteran breeder of Duroc-Jerseys from Columbus, Ohio, is visiting in this state and attended the Davis sale in company with Elmer Lamb of Ceres. Mr. Whittier has been familiar with the development of the Duroc breed for many years and says that he has never seen a section that appealed to him as being better suited to the production of livestock than this state. He expressed more or less wonder at the backwardness of the industry in California and told the breeders that they should set about developing more size and bone in their breeding herds.

Press reports tell of a spotted Poland China boar, Chief's Best, that sold for $35,000 in an auction sale held at Noblesville, Indiana. This record boar was owned by Frank Wise and was purchased by an Iowa breeders association. Forty head sold for an average of $1,609. It will be remembered that last week we reported a Wisconsin sale that averaged $1,555. And so the race for record prices goes merrily on!

Joe Levy, the Hampshire sheep breeder of Manteca, has returned from a buying trip through Idaho, Montana, Nevada and Utah, where he selected 200 head of Hampshire ewes.

J. E. Phillips of Fresno, owner of the Allana herd of Holsteins, has commenced improvements on his new ranch near Dixon and he expects to transfer his herd from Fresno to Dixon about May 1. Phillips has been studying the best dairy plants in this state and will embody the best features of each in the building now under way.

H. F. Bridgford of Patterson recently visited the leading Holstein herds of Washington and it is reported that he purchased a shipment of very high class females to add to his herd.

For the first time in its history the California Poland China Association will hold a consignment sale of bred sows and gilts at the university farm, Davis, February 26. Notwithstanding the fact that a large number of breeders will hold private sales this season, word has been sent out that each herd is expected to reserve one or more top animals for the Davis event, and many breeders who are not planning

Annual Bred Sow and Gilt Sale

Fresno Fair Grounds **Wed., Feb. 11**

40 BIG TYPE MONEY-MAKERS

Do Your Hogs Make Money?

The time is past when the California rancher and farmer can figure on making money with scrub hogs. With fixed values of land, equipment and feed, the profit depends on lowering the cost of production. Pure bred Polands of the big type will make more econmical gains than any other breed—that is the reason that the 40 members of the Fresno County Poland China Breeders Association—all practical farmers—are raising that kind. And their hogs are profitable. They have proved it for themselves—they will prove it to you. For the sale to be held at the Fresno Fair Grounds on the above date, 40 head of the best young sows and gilts from the herds of the members of the association have been selected. All are bred to high class boars.

Watch the Cultivator for future announcements.

For catalog, address the secretary.

sales of their own are taking advantage of the sale to consign the best they have to offer. Poland China breeders who are interested in the sale should communicate with the secretary, A. D. McCarty, 324 Insurance Exchange Building, San Francisco.

H. M. Barngrover, Hereford breeder of Santa Clara, reports the safe arrival of the young bull recently purchased in the East. The calf was sired by the noted bull Bonnie Brae 8th and is out of a Domino dam. He therefore combines some of the best producing bloodlines of the breed.

In a recent letter from Walter C. Ficklin, secretary of the Fresno County Poland China Breeders Association, he announces that the members of that organization will sell 40 head of bred sows and gilts at the Fresno fair grounds, February 11. He says that the reason for the delay in announcing the date was that the committee in charge was determined to accept only high class consignments and that some difficulty was experienced in inducing the breeders to part with even a few of their top animals because few breeders felt that they could afford to cut deeply into their herds. Other breed organizations have had the same trouble and it would seem to indicate that what is needed throughout the state is either more herds or larger herds of all breeds.

White & Terry, Sacramento, owners of the Glenwood herd of Shorthorn cattle, recently sold two young bulls to Wm. E. Gerber, Sacramento banker, for his place near Gerber.

Twenty sows and gilts bred to Matchless Big Bob and Chief Defender's Choice and 20 open gilts will be the offering next Tuesday, January 27, of Geo. V. Beckman and sons, Lodi, in their first public sale of Poland Chinas. Included in the offering is a young boar by the famous Glover boar, Liberty Bond, and many in the offering will be bred to a son of Chief Defender's Choice, the boar that made such an excellent record in the Meharry herd.

Manager Hill of Toyon Farm Association reports recent sale to the Sonoma State Home of Eldridge, of Toyon Bertram Valdessa, a young son of our herd sire, Finderne Soldene Valdessa, out of Bertha Boskadel, one of our most promising young cows, who has already made a two year old record of 456.67 pounds butter from 19,352.2 pounds milk in 272 days and has also made a record of 21.616 pounds butter from 467.8 pounds milk in seven days.

In keeping with the annual custom, the Western Berkshire Congress will hold a public sale and meeting at the University Farm, Davis, on Tuesday and Wednesday, February 17 and 18, the sale being on the afternoon of the second day. The first day of the session will be taken up with judging contests for women and students, the annual business meeting and election of officers with a banquet in the evening, and on Wednesday the sale hogs will be judged for prizes in the morning and the sale held in the afternoon with Ord L. Leachman officiating. Consignments are being made for a sale of 20 bred sows and gilts and five young boars. Frank B. Anderson, secretary of the Congress, Sacramento, announces that he will soon have the catalog ready for mailing.

The Les McCracken sale of Poland Chinas scheduled for February 29 has just been recalled. This Ripon herd, with the blood of the grand champion at the National Swine Show, is still increasing the number of high type Polands, however.

GREAT SALE OF POLANDS

A wire is just received regarding public sale at Kansas City of Poland Chinas from the Lester Glove herd. The sale was made on Monday. Forty-nine Poland China sows and gilts sold for $127,000. The topper was Fashion Girl, selling for $17,200.

IRON AGE GARDEN TOOLS

Answer the farmer's big questions: How can I have a good garden with least expense? How can the wife have plenty of fresh vegetables for the home table with least labor?

This Hill or Drill Seeder and Wheel Hoe Combined

solves the garden labor problem. Takes the place of many tools—stored in small space. Sows, covers, cultivates, weeds, ridges, etc., better than old-time tools. A woman, boy or girl can push it and do a day's hand-work in 60 minutes. Many combinations and prices. Write for free booklet today.

RED HOGS DE LUXE

The other day we visited a hog ranch. It was some ranch. That is, in its arrangements we have never seen one to equal it. Lest one may take it from the title above that this ranch is equipped with fittings of polished brass and hanging tapestry, we hasten to call attention to the fact that it is not these fittings we refer to in the title, but the animals. Its owners call it "The ranch where size is the fashion and quality reigns supreme."

But first, as to the fittings: It is a practical all around modern day equipped farm. There are some two and one-half or three miles of standard gauge railway There are small type railway locomotives for handling cars and moving feeds and supplies as needed. It is almost correct to say that there are miles of corrals and hog houses. There are hundreds of fine youngsters of the Duroc breed.

Regarding equipment on hand, an engineer may take his train of two or three cars down the track between pens, automatic traps set to release any amount of feed required for that particular pen accomplishing the work of feeding. The train moves along at the speed of about two miles per hour. The engineer of the train is the feeder. Little labor, big results. The ranch is built on the plan of saving labor at the expense of equipment. Labor is the most expensive thing on earth and is gone forever at the end of the day.

This ranch will hold a great "at home" day next Wednesday, January 28.

Big sales are being made in the East and California has been showing wonderful interest in Durocs. Pathfinder, Sensation, Wonder and Col. breeding will lend interest to this California sale. Superintendent Gatton inivites all to make it a point to be at Diamond Bar Ranch, inspect a modern, up-to-date farm and see some of the finest of Durocs.

The ranch is 28 miles from Los Angeles on the main highway from Los Angeles to Pomona, both the Southern Pacific and the Salt Lake, passing through it and bus line passes the gate. See a farm with broad guage railway plan of work.

"So make it a point to be at Diamond Bar Ranch, Wednesday, January 28, 1920.

BUSTING THE DAIRYMEN

A. A. De Ligne, general counsel for the Associated Dairymen of California, Inc., commenting on Attorney General Webb's opinion in regard to the quo warranto proceedings sought to be brought, says:

"The public does not understand the facts about the milk fight. You have seen one side in the newspapers. It is now our duty to make some plain statements in order to clear the air and have you understand what we are fighting for and whom we are fighting.

"Attorney General Webb rules that any cooperative association organized as a non-capital stock association may not have working capital or may not manufacture or pack the products of the farmers. This strikes directly at such associations as the California Fruit Growers Exchange, the Walnut Growers Association, the Almond Growers, the Lima Bean Association, the Alfalfa Growers, the Pear Growers, the Honey Producers, the Vegetable Growers, and other organizations formed under the laws of California, which permit the organization of these non-profit associations.

"In other words, Attorney General Webb throws down the gauntlet between the producer in the country who is seeking cost and a reasonable profit for his work and the city consumer who, through ignorance of rural conditions, does not care whether the farmer prospers or fails.

"The issue cannot be any more stringently drawn than Attorney General Webb now seeks to have it presented to the courts. In holding that milk associations are monopolistic, he distinctly disregarded the statement that of the total amount of milk handled in California, the plants of the various associations handled less than one-fourth. He also omits to make any mention of the fact that the California Central Creameries alone handles approximately as much milk as the entire California association of milk producers. If the milk associations are monopolies, how about the other company?

"The dairymen will fight and they will fight for the right of collective manufacturing and collective bargaining. This issue has been made all over the United States against dairymen. The people of the cities may as well understand that the dairyman in the country, who has to pay high wages to his employees and has to pay every item of the increased cost of living, must either have this right to bargain collectively and to manufacture or he will most decidedly go out of business and engage in something more profitable.

"Attorney General Webb evidently does not realize what 'reconstruction' means, although he uses this term in his opinion. Reconstruction means that the economic condition of the farmer is no longer going to be that of a serf and that no longer will the farmer be at the mercy of the manufacturing concerns that have instigated these actions."

BIGGEST YEAR IN MEAT INSPECTION

The federal system of meat inspection, which is conducted by the bureau of animal industry of the United States department of agriculture, recorded its biggest 12 months in the last fiscal year. The number of animals slaughtered under federal inspection was 20.6 per cent greater than the preceding fiscal year and 21.6 per cent greater than the average for the last 12 years.

The total number of animals inspected was 70,708,637.

The ante-mortem inspection resulted in the condemnation of 2,588 live animals on account of 18 different diseases and conditions.

Post-mortem examination revealed 40 different diseases and conditions resulting in the condemnation of 21,245 carcasses and 603,050 parts of carcasses.

The seven meat inspection laboratories which are a part of the service made more than 60,000 analyses of products. Analyses revealed 306 violations of regulations.

Employees in the meat inspection service number about 2,500, including veterinary inspectors, experts in sanitation, laboratory inspectors, lay inspectors, clerks and others.

The number of establishments at which inspection was conducted in the year was 895, located in 263 cities and towns.

There were certified for export 3,492,070,795 pounds of meat and meat products.

The total amount of meat offered for importation was 179,911,142 pounds, of which, upon inspection, 842,000 pounds were condemned or refused entry.

The inspection of meat for the military and other departments of the government amounted to 288,248,000 pounds, of which nearly 10,000,000 pounds were rejected.

In connection with actual inspection of meats and products, numerous investigations were conducted to develop and improve tests of various kinds and to perfect the system generally.

CLEANING MILK UTENSILS

The best results in cleaning milk utensils are secured when they are first washed in cold or lukewarm water and then with hot water. J. Keithley, dairyman for the North Dakota agricultural college, states that the reason for this is that hot water hardens the casein and albumen and makes them stick while they are soluble in cold or lukewarm water. The high grade of glue is made from casein due to its good sticking qualities. It takes hot water to remove the fat and boiling water, or better yet live steam, to kill the bacteria. So the order of washing should be first with lukewarm water then with hot water and finally a rinsing with boiling water or live steam. A brush should be used rather than a rag. Milk cans should be washed as soon as emptied. If let stand the acid formed by the milk left souring will hasten rust and the casein hardens when it dries making it hard to remove. The s

18,458 lbs. Milk

in a year is the record of this fine Guernsey. Records are worth trying for; but health is an absolute essential.

So Easy to Put Your Dairy On a Good-Health Basis

To be satisfied with anything less than top-notch health in your cows is a foolish waste of milk income. Most cow sickness is preventable—or curable. With the aid of KOW-KURE, the great cow medicine, such troubles as Abortion, Retained Afterbirth, Barrenness, Scouring, Bunches and Milk Fever can be eliminated from your herd. KOW-KURE acts on the digestive and genital organs—where nearly all cow diseases originate, and aids nature in inducing normal, healthy action. No dairyman who has used KOW-KURE will be without it.

Sold by nearly all druggists and feed dealers; 60c and $1.20 packages.
Write for our big free book,
"THE HOME COW DOCTOR."
It is full of facts every dairyman ought to know, and tells just how to treat cow diseases of all kinds.

Dairy Association Company
Lyndonville, Vermont

the utensils that have contained ilk or been in contact with it are ashed the easier the job will be, the ore thoroughly it can be done and ie utensils, if of iron or tin, will st longer.

ETTER BOARD FOR COWS GETS RESULTS

Proper feeding of the dairy herd eans more profits. The cow testing sociation paves the way to determin- g how to feed to the best advantage. he moral seems clear—join a cow sting association and learn how to ed.

In one instance a cow increased her tter fat production from 29 to 44 unds, or more than one-third. Her ner had been feeding barley, but by ding a variety of protein feeds and silage and providing drinking cups s able to see immediate results. Oil al is being purchased cooperatively some of the association members, d more feeding of balanced rations being done than before.

ENN COUNTY POLAND CHINA BREEDERS' SALE

The first sale of the Glenn County land China Breeders Association s held in Orland, January 13. For- two head, consisting of 21 bred sows d gilts, two herd boars, nine gilts d ten fall pigs were sold. An aver- e of $115.15 was made on the en- e offering, while the bred sows and ts made the fine average of $162.85. The top of the sale was the sow ss Wonder, by Glenn Chief and out Miss A. Wonder, from the consign- nt of J. A. Miller, J. N. Cook, Or- d, being the buyer at $525. Mrs. M. Goodfellow, Willows, secured a mber of the good sows, including ss Big Orphan, by Hather's Big Or- an, from the Yates consignment, $300.

E. A. Stopher, Anderson, who is es- blishing a herd, in addition to a mber of sows and gilts was the rchaser of the young boar A. Buster, Long Jumbo, dam Miss Stella, for 0. Due to the efforts of R. J. Yates, pioneer Poland China breeder of enn County, a breeders association s organized last spring. The high erage secured is a true indication the high quality of the animals of- ed, as well as the manner in which st of them had been developed. In sale held in California the past r has a better lot of sows been d, and if the standard set in this le is maintained, Glenn County will n rank as one of the foremost Po- d China counties in the state. Following is a detailed report of imals selling for $75 or more. Ord Leachman of Sacramento was the ctioneer:

BERGLUND'S DUROCS TO NEW MEN

t takes more or less nerve to be pioneer in holding a pure bred e in any community, but Harvey Berglund of Dixon had the courage his convictions and succeeded in aking much new ground, February when he held his first Duroc-Jer- bred sow and gilt sale. The Berg- d sale was the first pure bred hog e ever held in Solano County by individual breeder and the results this initial event will have import- t influence uopn the development of the livestock business in that community for many years to come. Thirty-two head were cashed for an average of $118, many of the offering being spring gilts. The top of the sale was reached by Western Lady, an aged sow, purchased by H. P. Slocum & Son, Willows, for $275. R. Sale of Red Bluff secured an exceptional bargain in an open gilt at $190. Elmer Lamb of Ceres picked one of the same kind at a similar price. F. M. Johnson of Napa selected an outstanding open gilt at $200. Winsor Ranch, Bonita, also got a good buy in an unbred spring gilt at $125. A feature of the sale was the number purchased by Solano County ranchers—14 head going to local buyers.

While the general average could have been higher, Berglund has the satisfaction of distributing a lot of well bred, well grown Durocs that will prove profitable investments for the purchasers.

Col. Ord. L. Leachman of Sacramento was the auctioneer and was assisted in the ring by Col. Harris of Dixon.

1. H. P. Slocum & Son, Willows, $275.
2. S. E. Whiting, Sacramento, $160.
3. Brownell & Marshall, Woodland, $170.
5. R. Sale, Red Bluff, $190.

23. Geo. T. Jeffrey, Vacaville, $100.
24. C. Phillips, $60.
25. H. McFadden, $75.
26. H. Schultze, $65.
27. C. Phillips, $80.
28. Geo. F. Jeffery, $90.
29. Geo. F. Jeffery, $65.
30. F. M. Johnson, $75.
31. Brownell & Marshall, $125.
32. R. J. Dixon, $100.
35. S. E. Whiting, Sacramento, $85.

EXPIATION

"What do they do to a woman in this country when she kills her husband?" asked the foreigner.

"Oh," replied the American, "they sentence her to six weeks in vaudeville or a year in the movies."—Cincinnati Enquirer.

Prince Walker Cornucopia

The Highest Record Son of Prince Gelsche Walker

His dam ALBA SADIE CORNUCOPIA CREETA has just completed official records of 36.26 pounds butter from 516.7 pounds milk in seven days. Her previous records were as follows:

At seven years—
Milk 338 days 13,849.40
Butter 864.23
At six years—
Butter seven days 34.13
Milk 532.40
At five years—
Butter seven days 28.85

She is a daughter of Sir Sadie Cornucopia, son of the first 30 pound cow, Sadie Vale Concordia.

Over 60 of our best females are bred to PRINCE WALKER CORNUCOPIA, and he will be given the fullest opportunity in this herd. Put one of his young sons at the head of your herd.

Dispersal Sale of Good Holsteins

C. F. Mohnike Herd, Angiola, Tulare County, Cal.
(on the old DIXIE RANCH)

Friday, January 30, 1920

Although no official testing has been done in this herd, and it has never been given any publicity to make it widely known, it is nevertheless a collection of very attractive Holsteins, bred in substantial lines, of better than average type, and in excellent physical condition. For a herd of its size it contains many more individuals of first class promise than are usually found, and it is a foregone conclusion that buyers will secure some extra good values here on sale day. The entire herd consists of

45 Registered Holstein Cows, Heifers and Bulls 45
20 High Grade Holstein Heifers and Cows 20

The herd of choice females is headed by CREAMCUP FIDESSA CORNUCOPIA LAD, a five year old bull of very desirable type, and strongly bred. He is by a son of the 33.53 pound cow Fidessa Bloom, and out of Anselogess of Sleepy Hollow, 32.68 pounds butter in seven days, 897.08 pounds butter from 2,751.7 pounds milk in one year. Thus it will be noted that he has an average of 33.10 pounds butter in seven days for his dam and sire's dam, and that his dam ranks as one of the leading yearly record cows of California. He will be sold, together with 11 of his young daughters, and his offspring stamp him as a sire of much promise. Owners of good registered herds may well look this bull over carefully.

THE REGISTERED FEMALES include a daughter of Juliana King of Riverside, a daughter of Anselmo, two granddaughters of Ignaro De Kol, a granddaughter of De Kol 2nd's Butter Boy 3d, and others of representative breeding.

THE GRADE COWS AND HEIFERS are an unusually good lot, and will meet with the approval of the most exacting buyer.

WE WILL ALSO SELL 30 Poland China feeder hogs, two teams of good mares, and a new No. 17 De Laval Separator with 1 h. p. motor.

Every registered animal guaranteed to be a breeder; no animal tuberculin tested.

PLACE OF SALE: Mr. Mohnike's place was formerly the well known DIXIE RANCH, one half mile east of Angiola, on main line of Santa Fe, nine miles south of Corcoran. Sale begins at 10 A. M. Catalog free on request.

Prepare to can large quantities of vegetables and fruits. In the first place, produce something to can; in the second place, secure a canning outfit; and in the third place find out how the different products are canned.

Agri GYPSUM

Alfalfa Growers will find that an application of AGRI GYPSUM will greatly increase the amount of available sulphur so much needed by this valuable crop and ordinarily the increased yields will bring returns amounting to several times the cost of AGRI GYPSUM and its application.

AGRI GYPSUM increases alfalfa yields and is beneficial to cover crop, land and grove.

Other crops greatly benefited by the application of AGRI GYPSUM to the soil include the following:

Beets	Cabbages	Barley
Beans	Cauliflower	Citrus Fruits
Peas	Vetch	Deciduous Fruits
Potatoes	Melilotus	Milo
Cotton	Peanuts	Cantaloupes

Agri Gypsum Will Reclaim Alkali Soils

It is a matter of official record that alkali soils may be reclaimed and made to produce splendid valuable crops by the application of Gypsum. If in doubt about this write for proofs and our authority for statements made in our advertising.

An application of AGRI GYPSUM on alkali soil neutralizes the alkali, rendering it harmless to the growth of vegetation.

Considering costs of nitrates, phosphates and other crop producing elements you can save money by alternating fertilizers with AGRI GYPSUM and obtain equally good, if not better, results at a saving to you and benefit to your land.

Ask your dealer for AGRI GYPSUM and you will be sure of the product, ground fine to do the most good with the least amount used. If your dealer cannot supply you write.

The neighbors say that I have such "good luck" with my hens. But Biddy and I know better, **we know that it isn't luck.**

Luck won't take a brood of fluffy, delicate little chicks successfully through the critical period when they are so susceptible to the ravages of disease; on through the growing stage, building strong, healthy birds—the birds that eventually make the good layers that return a full egg basket for the care and feed expended on them.

The biggest part of the "luck" is in knowing the kind of feed that gives the best results, and why. Biddy and I know that our success is principally due to Globe "A-1" Mashes and we know that they are different and better because of the dry buttermilk in the feeds.

The Dry Buttermilk in the Globe "A-1" Poultry Mashes is one of the important factors in unusual results with chickens from the baby chick stage to the productive hen.

There are three Globe "A-1" Poultry Mashes, each to fit a special need, Globe "A-1" Baby Chick Mash, Growing Chick Mash and Globe "A-1" Laying Mash; each contains the proper proportion of pure dry buttermilk, properly balanced ground grains, top quality meat protein, etc.

A BOOK WORTH HAVING

A booklet of simple and complete directions for feeding of baby chicks will be found in each bag—really more than feeding directions, this booklet is a manual for the proper care of baby chicks.

GLOBE A-1 GUARANTY

"Money's Worth or Money Back"—a guarantee as sound and as liberally made as are **Globe A-1 Feeds.**
If you are not pleased to have our Product, we are not pleased to have your money.
Your Dealer cheerfully backs this guarantee.

To Tell the Age of Hens

By Jean A. Koethen

IN response to the request for information regarding a Canadian method of telling the age of hens, which appeared in this column some weeks ago, William S. E. Raines of Waukena, Tulare County, very kindly sends a bulletin describing the method. It is written by Victor Fortier, assistant dominion poultry husbandman, and published by direction of the minister of agriculture, Ottawa. In his introduction the director of the dominion experiment farms says: "The information . . . in the accompanying bulletin is the result of much study and close observation on the part of the author. While such knowledge is not likely to be of very great value to the average person who keeps a few hens, it should be, nevertheless, of much use to judges, breeders and fanciers of good poultry."

The bulletin indicates five points to be considered in determining the age of a fowl—the spur, the leg, the down, the skin and chiefly the wing. The first four do not always give reliable evidence, but the last can nearly always be depended on.

The Spur

As the female rarely has a spur, study of this portion of the body is limited to the male. The older the cock bird, the longer his spur. At seven months old the spur measures about one-eighth inch in length. At 11 months it is about five-eighths of an inch and is generally straight with a rounded end. At two years the spur measures from one inch to one and one-eighth inches and curves downward or upward. At three years the spur measures one and three-eighths to one and one-half inches and is decidedly curved with the end generally turned upward. The growth of the spur continues during the whole life of the bird. After the third year it is not so smooth, not so regular in shape, it becomes thinner, harder and grows much more slowly.

The Leg

The general color of the leg varies with age—a black leg becomes bluish, a yellow leg becomes pink or white, a gray or mottled leg becomes blue, a pink leg turns red in the turkey, the leg, black at first, reddens conspicuously with age. At first the scales which cover the leg and toes in young birds are very smooth, shiny, fine, hardly visible and very soft to the touch, and they adhere firmly to the leg. At each molt they become wider and longer, then they rise little by little, become gradually more marked, tough, hard and comparatively rough.

Skin and Down

"If the flank feathers of a young hen are pushed apart, one may see a silky, long, light, extremely thin down, growing fairly regularly between the other feathers which cover all parts of the body. The skin, of a uniform tissue, fine and pink, is covered with a network of very fine bluish veins. When the hen is more than one year old, the down and veins have disappeared and the skin is of a dull white color, dry, not so smooth or elastic, and somewhat mealy." Here Mr. Fortier quotes a great French breeder, M. Voitellier: "When the spur is lacking, the color of the legs and beak, which is never so bright, never so deep, in an old bird, may supply indications; little red trails appear in the ears; white, yellow or red feathers are seen in a plumage that does not admit of such, silver tinges become yellowish, brindled feathers become more white, the eye becomes dull, especially in waterfowl."

The Wing

Most important because most reliable, as an indication of age, is the wing. The wing, let me remind the beginner, consists of three groups of feathers—the ten primaries, or large flight feathers, which are set at the extremity of the wing; the ten secondaries, or wing bay, which form the wide part of the wing; and the thirdaries or small quill feathers, which grow close to the body and when the wing is closed cover part of the other feathers. It is the secondaries which are to be studied in this connection. "The author is positive that all the great secondaries are renewed every year, just like all the other feathers. However, at each molt some of these feathers are modified, always in the same way, and these modifications are the characteristic markings on which the following theory has been based.

The number of short secondaries that are found in the wing indicates the number of molts the bird has gone through, or in other words, tells its age. These feathers are shorter than the rest, more rounded at the extremity, with a nearly central quill, and they end in a short, straight point, slightly projecting."

That is to say, if you grasp a hen's wing firmly with one hand and with the other draw back the ten long flight feathers, you will notice, if the hen is more than a year old, that one or more of the secondaries are shorter than the others. These shorter feathers are nearest the flight feathers. If the hen is in her second year the first will be shorter than the rest; if in her third year, two will be shorter and so on. After a hen has molted four times, four short feathers may be seen between the flight feathers and the other six secondaries. The best time for this examination is in spring or early summer, when one molt is entirely completed and the next not commenced.

* * *

I am sure we all appreciate Mr. Raines' thoughtfulness in giving us a chance to study this very interesting bulletin. This column should be a clearing house for all the information any of us possess.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, December 29 1919. Report for the week ending December 26.

That birds will show the telling effects of a severe week of cold weather is evidenced by the lowering of the egg production for the eighth week of the laying contest. This reaction was caused by the cold wave during the seventh week. The total production for all pens amounted to 1,253 eggs, which is 347 eggs less than the five year average and is a 17.[illegible] per cent production. By laying 4 eggs for the week a pen of White Wyandottes belonging to Langford Poultry Farm, Langford, British Columbia won first place for the week. Pinecrest Orchard's pen of Rhode Island Reds, which have been leading the contest for the past several weeks was a close second with a production of 40 eggs.

The department oftentimes receives inquiries as to why, at this time of the year, there is a large number of so called "out eggs" or "floor eggs" credited to each pen. (An egg laid outside the trap nest by one of the birds in the pen is known as a out egg.) There are several reasons for this—first, the birds are unaccustomed to their new quarters and not being familiar with the trap nest some birds as a result shy from the nest and lay the egg in the deep straw litter of the floor instead. As the attendants enter the pen on the average of once every hour, the birds that lay out eggs are soon identified and put in the trap nest to lay. After once laying in the trap nest the bird never as a rule lay on the floor again. The biggest number of out eggs at this time of the year, however, do not come from this cause, but are eggs found on the dropping boards in the morning when the pen is fed and watered, the eggs being laid at night. The reason for this laying is simply this—the organs of egg production are not functioning as rapidly during this time of the year as in the natural laying period, and as a result oftentimes the egg is manufactured and laid during the night. This is because of the short days and long nights, the birds not having time before going to roost to produce the egg. This reasoning has been proved to be correct by the electric light experiments carried on at this experiment station. The pens having the lights during the early hours of the morning and night seldom lay an egg during the night on the dropping boards, while in the check pens lo

under similar conditions but without lights many eggs are found on the dropping boards at night.

The three best pens in each of the principal varieties are as follows:

Plymouth Rocks

Merritt M. Clark (Barred), 175; Ingleside Farm (Barred), 167; Rock Rose Farm, 149.

White Wyandottes

Langford Poultry Farm, 210; Merrythought Farm, 200; Herbert L. Warren, 193.

Rhode Island Reds

Pinecrest Orchards, 355; Charles H. Lane, 260; Jacob E. Jensen, 235.

White Leghorns

Merrythought Farm, 278; George Phillips, 263; Meadowedge Farm, 228.

Miscellaneous

H. P. Cloyes (Buff Wyandottes), 259; A. L. Anderson (R. I. Whites), 235; A. E. Hampton (Black Leghorns), 78.

NATIONAL EGG LAYING CONTEST

By T. W. Noland

December report from Missouri Poultry Experiment Station, Mountain Grove, Missouri.

The contest hens laid 3,921 eggs during December, making an average of 13.07 eggs per hen. Pen 45, S. C. Reds, from Missouri, won the cup for December by laying 131 eggs during the month.

The ten leading pens for December are as follows: S. C. Reds, Missouri, 131 eggs; Barred Rocks, New York, 128; S. C. Reds, Alabama, 124; Buff Orpingtons, Missouri, 119; Buff Orpingtons, Missouri, 116; Columbian Rocks, Missouri, 110; R. I. Whites, Missouri, 109; White Wyandottes, Missouri, 109; Barred Rocks, Ontario, 106; S. C. White Leghorns, England, 105; Black Langshans, Missouri, 104.

Following is the number of hens laying 25 eggs or more during December: S. C. White Leghorn hen, 26 eggs; S. C. White Leghorn hens, 25; Columbian Rock hen, 25; Barred Rock hen, 30; Barred Rocks, 26; White Rock hen, 26; White Rock hens, 25; Silver Wyandotte hen, 25; S. C. Red hen, 29; S. C. Red hens, 28; S. C. Red hens, 27; S. C. Red hens, 26; S. C. Red hens. 25; R. I. White hen, 26; Buff Orpington hens, 28; Buff Orpington hen, 27; Buff Orpington hen, 26; Buff Orpington hen, 25.

Sales value of eggs average bird for December, 68 cents, sales value of eggs average bird to date, $1.16; sales value of eggs best pen for December, $6.91; sales value of eggs best pen to date, $13.73; average price received for eggs during December 63 1/3 cents.

ASAFOETIDA FOR COLDS

The poultry husbandry division of Clemson College, South Carolina, has found asafoetida useful in treating both colds and limberneck. For colds a piece the size of a walnut is dropped into a gallon of drinking water. For limberneck a piece of gum asafoetida the size of two peas for a mature fowl, of one pea for a fryer or of one-half pea for a chick is given every three hours. Three doses are said to be sufficient in most cases to effect a cure.

Two of the large poultry interests of Southern California are to be combined in the Martin-McConnell Poultry Farms, Inc., at Garden Grove. The McConnell Black Minorcas have made for themselves a name familiar to fanciers throughout the big show circuits and the Martin White Leghorns have won every first prize, as well as championships in both male and female classes at the P. P. I. E. Both have found the trapnest the key to success. The new plant is to be newly equipped and made a show place that will always welcome visitors.

The Artesia Hatchery (electric) began with one incubator ten years ago; today 225 are installed. This means 100,000 egg capacity, and the owner, F. W. Foster, has built up a big business in the day old chick.

The loafing hen must go. No longer will she be allowed to stick about the barnyard and devour perfectly good milo maize if she does not turn out regularly her share of those 90 cent orbs of nutrition.

SEES GOOD FUTURE FOR BEE-KEEPING

If American beekeepers are able to meet increasing demand, the enlarged American consumption of honey will continue, says the annual report of the chief of the bureau of entomology. During the war our exports of honey to the allied countries increased at least ten times, and the domestic use also went much higher. The increased export demand has continued since the end of hostilities, and the bureau sees reason to expect that this market will continue to be an important factor in American beekeeping.

Local sales of honey near the points of production have increased more rapidly than sales in the larger markets, but this can readily be remedied, according to the report, by the further development of the business of bottling honey.

The tendency to collect the bees of the country in the hands of commercial beekeepers is viewed as a wholesome sign for the development of the industry. Prevalence of two destructive brood diseases, and especially the necessity of careful study of beekeeping problems in order to obtain maximum crops, make it almost impossible for the person having only a few colonies to give the care essential for good beekeeping. Only the man who makes beekeeping his chief work may expect to get proper returns.

BETTER FOR HER

"How's your husband getting along, Mrs. Fogarty?"

"Well, sometimes he's better an' sometimes he's worse, but from the way he growls an' takes on whin he's better, Oi think he's better whin he's worse."—Boston Transcript.

DANGEROUS PROCEEDING

A woman and her daughter were at sea during a terrific storm. After a silence of some time the mother asked:

"Are you seasick, dear?"

"No, I think not, mother," replied the girl, "but I'd hate to yawn."—Nebraska Awgwan.

GOOD REASON

Sunday School Teacher: Why did the Lord command us to love our neighbors.

Little Hazel: I guess it was because we can get along with most everybody else.

AUTOCRATIC INTERFERENCE

"I guess we'll cut out that line of my speech," said Senator Sorghum, "about my being a public servant."

"It is a good old phrase."

"Yes, but it has had its day. As household relationships go just now, claiming to be a servant sounds just a trifle bossy."—Washington Star.

The Pride of Petaluma

Pratts

For Sick Chickens

Preventive and curative of colds, roup, canker, swelled head, sore head, chicken pox, limber neck, sour crop, cholera, bowel trouble, etc. Mrs. T. A. Morlay of Galien, Mich., says: "Have used Germozone 17 yrs. for chickens and could not get along without it." Geo. F. Vickerman, Rockdale, N. Y., says: "Have used Germozone 12 years; the best for bowel troubles I ever found." Frank Sluka, Chicago, Ill., writes: "I have lost but 1 pigeon and no chickens in the 3 yrs. I have been using Germozone." C. O. Petrain, Moline, Ill.: "I never had a sick chick all last season." Bernard Hornfng, Kirksville, Mo., says: "Cured my puniest chicks this spring." Ralph Wurst, Erie, Pa., says: "Not a case of white diarrhoea in 3 yrs. I raise over a thousand a year." Good also for rabbits, birds, pet stock.

GERMOZONE is sold generally at drug and seed stores. Don't risk a substitute. We mail from Omaha postpaid in new 25c, 75c and $1.50 sizes. Poultry books free.

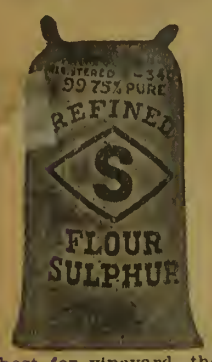
SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphur that money can buy; the best for vineyard, the best for bleaching purposes, LEAVING NO ASH.

VENTILATED sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste Sulphur.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California Street, San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR." Price List, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred.

BIG SEED COMPANY NOW DISTRIBUTING NEW CATALOG

Aggeler & Musser Seed Company of Los Angeles Issues 27th Annual Book Finest Yet Published

The largest seed company in Western America is now distributing broadcast its 1920 seed catalog. The big Annual will exceed all previous ones and it is said is a complete course in agriculture, with several hundred interesting illustrations.

There is something of interest to the Home Seeker, the Stockman, Dairyman, Rancher, Orchardist, Poultryman and Gardener, for there are departments on Home, School, Field and Demonstration, Garden Work, More and Better Potatoes, correct tools and implements to use for best results. Marketing notes on each subject, telling how and where to market. Hints on poultry, spraying, fertilizing and the use of insecticides. The whole book of 112 pages is most interesting, entertaining and instructive—in reality it is several books in one, for it includes the important "Garden Manual." Over 1000 questions are answered.

The catalog is absolutely free, and should you have not already received it, write immediately to the Aggeler & Musser Seed Company, 620 South Spring Street, Los Angeles, California. Its city store is in the center of the shopping district and its location is a great convenience to rural customers. There is a special "Call" Department to accommodate customers in town for a short time on business. Orders left on arriving are ready when called for. The big Mail Order Department and General Offices are situated at the city store, while the General Milling, Cleaning and Warehousing is situated at the big Warehouse at Sixth and Alameda. Be sure to secure a copy at once. Write today.

GRAIN

Wheat: The prices are based upon federal grades and standards at the terminals in San Francisco Bay and Los Angeles, and are as follows, per bushel of 60 pounds:

Hard White—	Per Bushel	Per Cental
No. 1	$2.20	$3.66 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.13	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.09	3.48½

The above are minimum prices.

For sacked grain add 4½ cents per bushel of 60 pounds to above prices. Deductions of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.30@3.35; black, 3.50.

Corn: California yellow, 3.25@3.30 per cental; Egyptian white, 3.75@3.80; mile maize, 3.25@3.30.

Barley: Spot feed, per cental, 3.60@3.65; brewing, 3.65@3.75.

HAY

Under date of January 17, Scott-Magner & Miller says:

Receipts past week, 1,724 tons, mostly of the medium grades and has arrived both by rail and water in equal quantities. Scarcity of cars throughout the country is about over. Owing to the continued dry weather, as well as the small stocks of hay on hand, the hay market is taking quite a jump and is considerably higher. Demand from the country districts continues without abatement and although this demand is mostly for stock hay and alfalfa, yet considerable horse hay of No. 1 wheat or red oat is in demand. Trade is somewhat light in the city but the country demand more than makes up for this. Weather continues clear and cold and practically no grass is growing on the ranges at this time. Many are speculating on a dry season but as a rule rain always comes in this state in time to produce at least part of a crop if not more, and it is safer to figure so. Alfalfa is still moving in from Nevada in large quantities. Although up to this time there has been practically no demand for straw, yet considerable has been sold of late, mostly for stock feeding purposes.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses are to be added according to conditions:

Fancy Wheat Hay (light 5 wire bales)	28.00@30.00
No. 1 Wheat or Wheat and Oat Hay	25.00@29.00
No. 2 Wheat or Wheat and Oat Hay	24.00@26.00
Choice Tame Oat Hay	27.00@30.00
Other Tame Oat Hay	24.00@27.00
Wild Oat Hay	23.00@26.00
Barley Hay	23.00@26.00
Alfalfa Hay	25.00@30.00
Stock Hay	20.00@23.00
No. 1 Barley Straw	.50@ .80

Citrus Markets

Los Angeles, January 21, 1920.

The blizzards have caught some fruit in transit and this frozen stuff has been thrown on the market at low prices. Good stock which has gone through safely is still commanding fair return. On the whole the market is looking much better. F. o. b. prices shipping point are ranging from 3.50@4.00.

First class lemons are also receiving good demand.

Shipments

Shipment of oranges from Southern California to date since November 1, 1919: Oranges, 4,842 cars; lemons, 816 total, 5,658. To same date last season, Oranges, 3,430; lemons, 1,404; total, 4,834. Central California: Oranges, 3,387; lemons, 143; total, 3,530. To same date last season: Oranges, 2,183; lemons, 163; total, 2,346. Northern California: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 232.

Carlot shipments of peas are now moving from Carlsbad, San Diego County, about five per week. The present unseasonably hot weather has not been best for development of the crop, but it is not believed that the yield will be affected. Quality reported excellent.

Imperial Valley cantaloupe growers encouraged by favorable weather, have planted early acreages and are protecting plants from frost with paper covers. Main planting season does not begin until about February 1, continuing until March 15 with some planting even later. It is probable that the acreage will be close to 20,000 but no definite figures are available for sometime and late acreage will be affected by ability to dispose of lettuce crop.

RELATIVE RESISTANCE OF CROPS TO ALKALI

(Continued from Page 13)

tions of carbonates and practically no growth was made in concentrations higher than 3.000 parts per million.

Taken all together these results show that salts added to the soil in higher concentrations than 4.000 parts per million of chlorides, 8.000 parts per million of carbonates, and 12,000 parts per million of sulphates are entirely too high to allow a satisfactory yield of the ordinary crops. These figures would have to be modified if they were obtained from analysis of alkali soil, since the relation between salts such as chlorides and carbonates is not the same for "salts added" and "salts extracted."

As crops for alkali land, the cereals would doubtless be among the best of those investigated, and the grasses the poorest.

Of the forage crops, vetches, cow peas, alfalfa, and sweet clover are doubtless superior on alkali land to the grasses. Timothy and alsike clover, which are recognized as good crops for wet land, are shown to be relatively non-resistant and probably should not be included among the forage crops for wet alkali land.

THE BABIES' BEDTIME

Sweet are children in the morning, in the afternoon or night,
In their dainty frocks of red and blue or gowns of simple white;
In their play up in the playroom, in the yard or on the lawn,
But they're sweetest when it's bedtime and they get their "nighties" on.

Little ghosts of white a-romping o'er the bed and through the room,
In the season of a lifetime they're the rosy month of June;
Little ghosts of white a-marching to the music of their laugh
And the one who e'er would miss it sees in life its minor half.

Little curls a-dangling, frowsy—to the head a fitting wreath,
Little gowns a-hanging loosely and the peeping feet beneath;
Merry monarchs of the household and their love as is the fawn,
And they're sweetest when it's bedtime and they've got their "nighties" on.

Oh, the clear notes of their laughter and the patter of their feet,
As they romp and chase each other in the game of hide and seek—
Gives a hint of faint suspicion of the world that is to be,
For the Master taught us, saying: "Suffer these to come to me."

Soon fatigue o'ercomes the players, and the white brigade is still,
And the "Now I lay me" whispered with a pleading and a will.
Oh, the wee tots are in slumber and their dreams are in repose.
For the clearness of a conscience rivals beauties of the rose.

And the white upturned, sweet visage adds to innocence the charm
Of the soul reposing trust upon the guardian angel's arm;
Oh, the sweetest-scented nectar flowing from this life is gone
If you can not see the babies when they get their "nighties" on.—Indianapolis Press.

THE DESERT FEUD

By M. E. Bemis

(Continued from last week.)

Before beginning the long, slow, overland journey, an organization had to be effected. The caravan that crawls slowly across the desert and mountains, far from civilization and in constant danger from the attacks of hostile Indians, is as much isolated as the ship that sails the ocean, and consequently much depends upon the executive head of such an expedition. We were fortunate in having with us Captain Mark Sprowle, of the —th Texas Cavalry. Captain Sprowle was not only a capable executive but knew the country in a rather general way and the trail in an intimate way, having twice made the journey. After thoroughly canvassing the available men who could be trusted to take the train across, Captain Sprowle was unanimously chosen to command. To this happy choice may doubtless be attributed the averting of what would have been one of the greatest tragedies of the desert, for Sprowle was a commander who insisted on absolute discipline, but one from whom in matters of dispute one might expect unbiased judgment.

We left San Antonio early in February of the early 70's, presuming that at that season of the year there would be an abundance of feed and water for the stock. The first part of the journey was uneventful so far as encountering difficulties was concerned. Very early in the journey, however, there developed a situation that so far as I know was unheard of among desert trains, and one which but for the dominating spirit of Captain Sprowle and the event which I am about to describe would probably have resulted in the worst of tragedies.

It was only natural that John Brent and Mary Andrews, being the only two unmarried young people, should seek each others company. It was just as natural perhaps that Mary should not fail to remind Brent that he was of the North and that he had taken an important part in the struggle which had practically destroyed the South and with it the fortunes of her father as well as many others. This was at a period when feeling was still high, and it required but little to kindle a little fire of sectional wrath into a serious conflagration. Quarreling between the pair became almost constant, and—although on the part of Brent—it was begun more in a teasing manner and wholly without resentment, one word and then another led him to say more bitter things in repartee than was discreet under the circumstances.

The culmination of the quarrel came when we had been out maybe two or three weeks and Brent (and I blame him now for it, for he should have had better judgment), called the attention of Captain Sprowle to the fact that all the women had their special work to do with the exception of Mary Andrews who sat idly by and watched the women prepare the meals and perform other tasks whenever camp was made. Brent insisted that it was but fair that all should take part in the work as all the men did with the work of driving, herding the cattle, cutting wood, etc. Obviously this was none of Brent's business, although it was equally obvious that he was entirely right. Looking back, I think he was actuated more, considerably more, in fact, by a sincere wish to see the better qualities in the girl brought out, to see her learn to become better prepared to meet the hardships of the pioneer. If I were writing a novel I would not be permitted to admit that my hero made mistakes or had any faults, but in relating facts I do not care to gloss over the mistakes even of those whom I loved and admired.

Well! the conversation of Brent and Sprowle was overheard and reported to Major Andrews, who promptly accused Brent of insulting his daughter, and through a young man who had served under him in the army, acting as his second, he challenged Brent to a duel. Although opposed to duelling on general principles, Brent just as promptly accepted the challenge and chose pistols at ten paces as the weapons and the time the following morning at sunrise.

An effort was made to keep the matter secret, but it was soon reported to Captain Sprowle by some one who learned of it through accident. As soon as supper was over that night and while the women were clearing up after the meal, the captain called all the men to a conference out of earshot of the women He said: "A serious situation has arisen among us. I understand on good authority that a duel between two of you men is to be fought tomorrow morning at sunrise. I have only this to say: Your private quarrels are as much your own affairs as your purse or any other property. It is not my purpose to prevent any of you from settling any differences in any court that you may choose, whether it be the courts of law as prescribed by men or the courts of the gunmen, but while I am in command of this expedition I shall insist, and back my demands with every force available, that there be no weakening of our numbers while we are going through a country where danger from hostile Indians is imminent and when death or crippling of one or more of our men means so serious a matter. You are to consider all quarrels off until we reach the end of our journey. I take this action entirely as a measure of safety to the women and children and to the members of this party who have placed their lives under my protection. You, each of you, owe something to the others, and you have no moral right to take any steps which will make you a burden upon the others as one crippled would be, and you owe to the others the protection which you can render and which obviously you would be unable to render if you were killed I expect you men to forget this unfortunate affair, at least until we are across the Indian country."

All recognized the force of his logic, and through the seconds of the two principals it was agreed that the challenge and acceptance should stand until the end of the journey. Naturally such a situation resulted in more or less discussion, and discussion of a matter of this kind, and particularly in an isolated train such as a slow moving expedition of settlers, could only be productive of hard feelings and the final division into two groups, one supporting John Brent and the other Major Andrews, for this was at a time when, as I have said, sectional feeling was high and it took but little to start again the fires that had fed the long drawn out struggle of the Civil War. Those who at the beginning of the journey had promised to become the best of friends gradually shunned each others company. Little by little two camps instead of one were formed; true, at night all were

The Modern Idea

More than ever is the physician placing dependence upon hygiene, fresh air, sunlight and adequate nourishment to bring about a restoration of strength. That is why

Scott's Emulsion

is so helpful and universally used as a means of up-building the weakened system. When you need a tonic, try the logical means of toning up the body—take *Scott's Emulsion.*

gathered within the protective circle of camp wagons; true, there was an exchange of civilities, but underneath there was a restraint that grew and grew each day, a restraint that was gradually drawing within its spell every man and woman of the party.

You have seen a smouldering fire of green wood upon which had been thrown a dash of coal oil. You have watched the smoke gradually getting more yellow and more dense and waited for that instantaneous flash of flame that you knew was bound to follow as soon as the oil had turned to gas and should become ignited from the coals of live fire.

That was the situation.

(Continued next week.)

THIS WEEK'S PATTERNS

Some exceedingly practical models are shown this week. The child's romper suit is fascinating, as is the little girl's dress-up dress 2921. This latter offers suggestion for putting together two materials or prolonging the usefulness of an outgrown dress. In wool or dainty cotton it is charming. The good old-timer Mother Hubbard nightie pattern will appeal to many, especially for warm cotton flannel. The lady in lower right corner in trim housedress, who has just received a box of roses from the florist, suggests rather to the California eye a home gardener with box of plants ready for setting out in her own backyard or frontyard. Let's raise our own vegetables as far as possible this year to help cut more corners. And such a serviceable dress as 2912 may as well be an attractive feature of your garden life.—R. P. D.

> Mends are service stripes these days. — Anna Lenington Heath.

ECONOMY LETTERS FROM READERS

The Cultivator had not intended to publish until the issue of January 31 any of the letters from household readers on cutting the corners on the high cost of clothing, but so many letters have been received that there will be enough for two weeks' issues, and they are so excellent and helpful that we decided not to hold them back. Awards will be announced in issue of January 31 as previously announced.

THE FIGHT WITH OLD H. C. OF L.

By Anna Lenington Heath, Pomona

Dear Friends of the Household Department: In the fight with old H. C. of L., I have found these three things helpful: thoughtfulness in buying, good workmanship in making, and fair treatment in using.

Buy the very best you can afford; anything cheap now is bound to be poor. In ready made garments choose simple, conservative styles that may be worn long without looking too out of date. Avoid the fussy, much trimmed coat or dress; it grows shabby over night, almost. Use the same care in buying yard goods. Get a staple brand, firm and of good weight, if white, and of fast dye if colored. This last is not always possible, but most blues, reds, pinks, tans and yellows fade less than lavender, purple, green or cerise.

Insist on good workmanship in any ready made garment. A poorly made one is never satisfactory and gives little service. In making things at home take time to do a thoroughly good job. Make everyday underwear, work dresses and aprons simply. Machine stitching, a little crocheted lace or a fancy wash braid are trimming enough. No bones will be broken and a few pennies saved if no trimming at all is used.

Keep all coats, skirts and one piece dresses hung on hangers when not in use. Brush out any mud or dust before hanging away. Keep the buttons on and sew up promptly any rips in seams or linings. Give like care to tub garments. When they come to actual mending, darn or patch neatly. Mends are service stripes these days. Rancher's work shirts usually break first across the back. When this happens slap on a patch from shoulder to shoulder and down about to the waist line and the shirt will carry on for a fortnight or so longer. Having the good man's shirts for every day all one color and material is helpful as the worst worn one can be used to mend the others. This is true too of kitchen aprons.

Careful home washing will lengthen the life of any garment and will make Methuselahs of some stout ones. The average laundry kills them off in infancy or early childhood. And beware the too hot flat iron. A scorch soon becomes a hole.

There is much difference in patterns. Some leave the cloth cut into wasteful, illshaped pieces that are of little use except for patchwork, and others, just as attractive in design, allow the use of almost every inch of material. A little study of the layout of the pattern on the back of the envelope before buying will often effect the saving of from half to three-quarters of a yard of material.

The combination undergarment, known for some inscrutable reason as a "Teddy-bear," I find more economical than corset cover and drawers. The four pieces that cut out under the arms may be pieced together to make a petticoat for the baby, the princess sort that buttons on top of the shoulders. Often several short pieces of different weight muslin can be pieced together to make underwear, putting the heaviest weight where the hardest wear comes. Fell the piecing seams neatly and the effect is not at all bad.

As for socks and stockings, buy as many good ones as possible, change often, wash gently and keep your toe nails cut. Mend the little holes before they grow to big ones. Some of the deadly runners can be avoided by wearing a moderately tight elastic below the knee and slightly loosening the corset garters when doing work that requires much stooping or bending.

Care in buying, making and using, these three, but the greatest of these, like love, is care in using.

Yours for lessening the cost.

"SHREDS AND PATCHES"

By Linda W. McNeil, San Jacinto

When my house dresses began to wear out I cast about to see what I could do. In looking over odds and ends I found a black cloth skirt of excellent material, but way out of date. This I shortened at both ends, took out some of the superfluous fullness in the back, and the result was a very serviceable garment.

And now, please don't laugh at my waists. I had been saving the goodman's khaki shirts for rugs. An idea came to me. The bodies of the shirts were good, the sleeves only being worn out. Out came my pattern and I found that three bodies would furnish material for one waist.

I made them plain shirts down to waist line and finished with a two inch attached belt. The result was a semi-middy easy to get into, the belt coming down well over the band of the skirt and obviating the necessity of a second belt. One is all yellow and another has body and cuffs of yellow with a black stripe, with belt and trimmings of plain yellow. They look very well, considering their origin.

I colored some sugar sacks for lining for a quilt and found there was one too many. They were a dark blue. A belt converted it into an apron which the goodman pronounced "gay," a failing which is growing less noticeable with repeated launderings. The skirt of an old indigo blue wrapper furnished another, and so I have put off for a season the evil day of buying 40 cent gingham or 25 cent calico. Black silesia, a former dress skirt lining, furnished ruffles for the ragged edges of black petticoats.

Another discovery was that quite presentable handkerchiefs could be made from the fronts and sleeves of old tailored white linen waists. Hemmed with care and fine thread, and smoothly ironed, they are white and soft and comfortable to a tender nose when colds are raging.

I am nearing the end of the "shreds and patches," but for a time longer I am furnished with "the raiment for daily wear."

PERMANENTLY LOCATED

"A rolling stone gathers no moss."

"Yes," answered the man who doesn't care much for proverbs; "but that's no great satisfaction to the animal that gets stuck on a piece of flypaper."

The Cultivator Patterns

BE SURE TO SEND SIZE

3100. Set of Infants' Clothes. Cut in one size. It will require 2⅝ yards of 36 inch material for the Dress, 2¼ yards of 27 inch material for the Petticoat and 2 yards of embroidery for the ruffle. The slippers require ⅜ yards of 18 inch material and the Barrie coat ⅝ yard of 27 inch material for Band, and 1 yard 40 inches wide for Skirt. Price, 10c.

3120. A Smart Coat Dress. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 will require 4½ yards of 44 inch material. Width of dress at lower edge is about 1⅞ yard. Price, 10c.

2921. Girls' Dress. Cut in 5 sizes: 4, 6, 8, 10 and 12 years. Size 10 will require 2¾ yards of 44-inch material for the dress and 1⅛ yard for the jumper. Price, 10 cents.

3118. Ladies' Night Dress. Cut in 7 sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A Medium size will require 4¾ yards of 36 inch material. Price, 10 cents.

3098. A Comfortable Play Garment. Cut in 4 sizes: 1, 2, 3 and 4 years. Size 3 will require 3¼ yards of 27 inch material. Price, 10 cents.

3111-3106. A Good Costume for Mature Figures. Waist 3111 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3106 cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It will require 5½ yards of 36 inch material for this costume for a Medium size. The width of skirt at its lower edge is 1¾ yards. Two separate patterns, 10 cents for each pattern.

3124. Girl's Dress. Cut in 4 sizes: 8, 10, 12 and 14 years. Size 10 requires 3⅛ yards of 40 inch material. Price, 10 cents.

2912. Ladies' House Dress. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 requires 5 yards of 44-inch material. Width of skirt at lower edge, is about 1⅝ yards. Price, 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest Chicago styles, all pattern orders are filled in Chicago. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

A FEW EXPENSE SAVERS

By Mrs. E. A. Follensbee, Chino

I have adopted a few expense savers at a few years ago I wouldn't have ought I could possibly do, but they ay be of help to someone else in ese times of high prices.

For kitchen aprons take a piece of ble oilcloth of the best grade. Cut shape like a butcher's apron; bind ges with cotton tape, lengthening e stitch of the machine, using the pe for ties and around the neck. I ke the width for length, so only buy length what I wish for apron width. his can be wiped off with a damp oth every day.

My tablecloths had gone beyond re-ir, so I bought a good grade of eached sheeting for every day use ere.

There must be a new floor covering r the sitting room and $75 looked etty large just now, so we invested denim through which very little rt seems to work. Later on I shall ve it woven into a rug as I find ere is a firm which will color it y color desired.

Lastly, I had one pair of cotton ankets and one of wool, too badly orn for further use, so cut them in ro, slipping them sidewise to make em wide enough for quilt paddings. his makes them double over the bed t single at the edge for tucking and with pieced tops their ex-nse was very small. Mine were d. The wool one is heavy enough r a comfort and both can be washed thout ripping.

HE JUJUBE—ORIGINAL TESTED RECEIPTS

By Forest E. Grow

rocessing

The fruit should be processed as on as possible after picking, while m and unwrinkled.

Sort fruits according to sizes, that large, medium, and small, and pro-ss these sizes in separate pans.

Make a sugar syrup by dissolving e pound sugar in one-half cup hot water, or in this proportion for quantity needed. Water should be added as required to keep syrup at about original consistency. It was found that bar sugar made the best product.

Wash fruits in cold water and place enough jujubes of uniform size, to cover pan (one layer only).

Simmer over low fire for two hours. Do not allow syrup to boil up or skins will split and make fruits imperfectly shaped and ragged when finished.

Remove fruits from syrup with skimmer, drain and place on plates or enameled pans. For small quantities place fruits in sunny window, with window open, so that air and sun will dry the sticky coating. For large quantities we constructed a box on legs and placed a window sash over it. Jujubes were placed in this glass box and "sun baked" for about two or three days or until no longer sticky.

Remove fruits from plates or pans and place on oiled paper (sticky side up). We use lath trays, such as are used for drying apricots.

As soon as no longer sticky, usually about three days, the fruits should be pierced many times with a broad pointed steel needle; only the long, narrow varieties may be slit with a knife, without making an undesirable ragged product. The round or oblong fruits cannot be satisfactorily slit; they must be pierced.

For second processing, add one teaspoon strained honey to each quart of syrup, or to the taste. Place jujubes in this honey flavored syrup and boil slowly from ten to 20 minutes according to size of fruits.

Remove fruits from syrup, place on pans and dry in air or sun, or "sun bake" for one or two days according to weather conditions.

Place fruits on oiled paper again, and when sufficiently dry pack in one-half pound candy boxes. If not packed tightly and covered with oiled paper, the fruits dry out quickly. It is advisable also if fruits are to be kept any length of time to wrap the box in oiled paper.

Stewing Fresh or Dried Fruits

Wash fruits and place in kettle of cold water (just enough to cover or float fruits), and with lid on kettle let come to a boil slowly. Then simmer until plumped out and soft.

Place fruits in cold water for a few minutes and then peel.

Make a medium sugar syrup of about two parts hot water to one part sugar (about like honey or syrup). Drop peeled fruits in syrup and simmer until thoroughly cooked through.

Note: After washing dried fruits pierce or slash skins with a sharp pointed knife.

Jujube Paste

Follow directions for "Stewing Fresh or Dried Fruits," up to point of making the sugar syrup. After peeling as directed, remove seeds, or rather remove pulp from seeds as the jujube is a clingstone type.

Cook pulp slowly and stir frequently to prevent scorching.

Prepare a hot syrup composition in another pan, as follows:

Three ounces (ten cents an ounce) gum arabic dissolved in five fluid ounces (ten tablespoons) water. After dissolved add three ounces cane or bar sugar.

Evaporate to a very thick consistency or until syrup is clear and almost ready to sugar. When paste thickens and commences to leave pan then add the hot syrup composition. Then cook mixture until thick and ready to leave pan. Pour out on plate or oiled paper and cool.

Jujube Syrup

(Maple syrup's only rival). When processing syrup becomes thick and dark colored. It may be put in containers (baking powder cans preferred), in the thick state. Add a few drops of pure glycerine to prevent syrup from candying.

When wanted for use, thin to proper consistency and use as maple syrup, with which it vies in flavor, if not superior.

Canned Jujubes

Follow directions for "Stewing Fresh or Dried Fruits" up to point of making the syrup. Proceed to prepare the same as when canning peaches or any other fresh fruit in a light sugar syrup. They keep perfectly and are of excellent flavor.

RAINDROPS, ORANGES AND BEANS

The gentle rain descended
Upon the dusty earth;
Some hearts by it were gladdened,
Some faces showed no mirth.

The heavy raindrops falling
Caused one man to rejoice;
His neighbor took to swearing,
With anger in his voice.

A lesson from the rainfall
The writer thereby gleans;
What's good for thirsty citrus land
May raise the deuce with beans.

So as through life we journey,
We find it works the same;
And what brings one man honor,
May bring another shame.

The rain brings one a blessing
With healing in its drops;
And to another damage great,
Depending on their crops.

What helps one bunch of people
Another bunch sure "cleans";
If one man has a citrus ranch,
And the other guy grows beans.
—William Hamilton Miller in Fillmore Herald.

NUT SHELLS

A Methodist Centenary speaker at Ohio State University began an address to the students the other morning in this way:

"Now, I'm not going to talk very long, but if you get what I'm going to say in your heads you'll have the whole thing in a nutshell."

ANOTHER MEANEST MAN

The meanest man on earth has been discovered. He had a rooster that woke his neighbor up at 4 o'clock every morning for two years, and the very night before the neighbor wanted to catch an early morning train he killed the rooster.

SOME PULL

Casey: Finnegan got his loife insured last June an' he's dead so quick.

Cassidy: Shure, he must hov had a pull wid de insurance company.—Boston Transcript.

—and welcome for three splendid reasons, especially in these days of soaring costs—because Calumet gives three big positive helps in reduction of living expense.

You save when you buy it—moderate in cost. Leaves you more money with which to buy other things. You save when you use it—has more than the ordinary leavening strength—therefore you use less. You save materials it is used with. Never fails.

CALUMET
Baking Powder
"BEST BY TEST"

Makes Most Palatable and Sweetest of Foods

Produced in largest, finest, most sanitary Baking Powder Factory in the World. Contains only such ingredients as have been officially approved by United States Food Authorities. The first choice of millions of housewives for a third of a century. Order from your dealer.

THE refreshment tray can always thank Ghirardelli's Ground Chocolate for its magic aid. Creamy hot chocolate to drink; cakes with possibly a chocolate filling and frosting; waxy squares of chocolate fudge—not to mention countless other "goodies"—appear in a twinkling when the hostess summons the ever-ready can of Ghirardelli's.

Never sold in bulk—but in cans only.
In ½ lb., 1 lb. and 3 lb. sealed cans—
at the store where you do your trading.

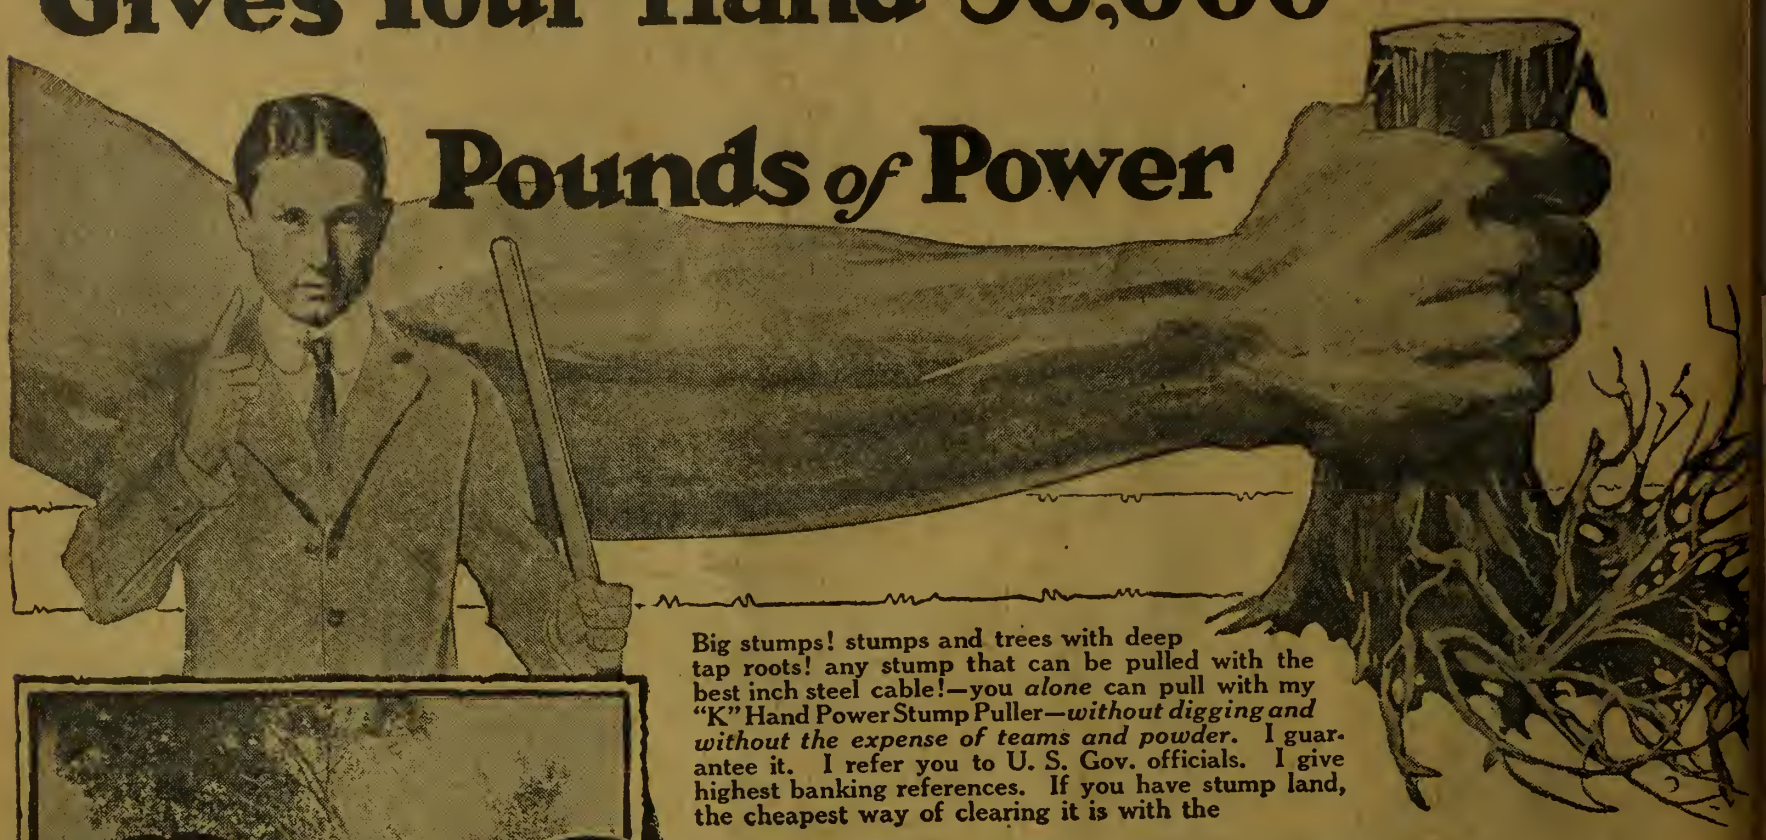
My K Hand Stump Puller Gives Your Hand 96,000 Pounds of Power



Big stumps! stumps and trees with deep tap roots! any stump that can be pulled with the best inch steel cable!—you *alone* can pull with my "K" Hand Power Stump Puller—*without digging and without the expense of teams and powder.* I guarantee it. I refer you to U. S. Gov. officials. I give highest banking references. If you have stump land, the cheapest way of clearing it is with the

HAND POWER

K Stump Puller

Frank Hance, a *one-armed* farmer of Bowie, Md., pulling a double silver maple 3 ft. 8 in. in diameter at the ground, with deep tap roots. This is an easy pull for the "K," as the cable can be hitched high and the leverage is consequently greater.

How the "K" Pulls Biggest Stumps

The "K" works on the leverage principle of the ordinary lifting jack, except that the power is applied on a cog-wheel instead of a standard. 100 lbs. push on the lever develops a 48-ton pull on the stump—all an inch steel cable will hold. One man operates it alone—no teams to pay for—no walking.

A Mechanical Wonder

Made of finest steel—guaranteed against breakage. Weighs only 171 lbs.—easily carried or hauled about on its own truck wheels. Has two speeds—60 feet per minute for hauling in cable or for small stumps—slow speed for heavy pulls. *Works equally well on hillsides and marshes where horses can not* work

Owners Praise It

H. Sinclair of the Dept. of the Interior, a U. S. Gov. official, writes: "The stump puller is a wonder."

Ernest Thompson Seton, author and naturalist, declares the "K" "a great success."

Hundreds of owners write in, telling of pulling six- and seven-foot stumps, of pulling faster and pulling bigger stumps than by any other machine.

Special Offer We are making a special offer to get a "K" Stump Puller introduced in every neighborhood. Write us today for full information and for free book on Land Clearing and about our Wonderful Drag Saw.

CALIFORNIA CULTIVATOR

and LIVESTOCK and DAIRY JOURNAL

Los Angeles — An Illustrated Weekly for the Rural Home and Ranch — San Francisco

Vol. LIV — January 31, 1920 — No. 5

Why Does the Dairyman Raise Prices?

THE policy of the Irishman who took his shillalagh to Donnybrook fair and knocked everybody over the head seems to be the policy of interests which are able to command powerful influence.

It may be that effort to discourage cooperation in the marketing of the products of the farmers of California will result in lower costs of living. Our guess is that it will be quite the reverse, for when production is discouraged and lessened prices will naturally skyrocket still more.

State Market Director Weinstock gives a parting salute to the backers of the present effort to destroy the milk producers association. Mr. Weinstock says:

The private creamery owners and milk product manufacturers of California for years had their grip around the throats of the dairymen, exploiting them to the degree that many of them were forced out of business, with consequent reduced milk production.

Now comes Mr. Preston, representing these private creamery owners in a statement published in the press, and points out what purports to be a delinquency on the part of the state market director, because he spoke from the same platform with President Jas. M. Henderson, Jr., of the Associated Dairymen of California, Inc.; and made an appeal to the dairymen to organize as a matter of self preservation, cooperative marketing associations.

If Mr. Preston knew the law, he would know that the state market act expressly provides that the state market director shall aid the farmers of the state to organize cooperative marketing associations, in order better to preserve the productive interests of California.

When the state market director stood on the same platform with President Henderson of the Associated Dairymen of California, Inc., appealing to the dairymen to organize, he was acting simply in accordance with the law and performing his official duty.

Evidently Mr. Preston is also ignorant of the fact that in encouraging and aiding the farmers of the state to organize for marketing purposes, California is simply following in the footsteps of the federal government.

Secretary Houston of the United States department of agriculture is doing on the broadest scale throughout the land precisely what California, through its state market commission, is doing in a modest way within the boundaries of the state in organizing its farmers.

It may further interest Mr. Preston to know that if I were not confined to a sick bed at this time, I would be out today, and tomorrow and the next day, doing with all the energy at my command the very thing that he condemns, that of organizing the farmers for their good, for the consumers' good by insuring more production on the part of farmers, and for the good of the state by increasing through organizatin, agricultural prosperity.

Mr. Preston endeavors to besmirch President Henderson of the dairymen's association because of the work he is doing in connection with the dairy interests of the state. I happen to be very familiar with the work of Mr. Henderson and I want to take this occasion to say that I regard Mr. Henderson as one of the most valuable citizens of the state of California.

The work that Mr. Henderson has done and is doing in freeing California dairymen for all time from the clutches of the clients of Mr. Preston and in building up and developing the great dairy interests of California is worth to the state the interest on untold millions of dollars. I also happen to know that Mr. Henderson, a dairyman himself, at great personal sacrifice is doing this work as a public service.

If any one sufficiently interested will but take the trouble to investigate, they will— (Continued on Page 174)

Get These Amazing Facts on "Fruit-Fog" Spraying

SEND the coupon today Read the story of "Fruit-Fog" Spraying now. Learn why Fruit-Fog, after the severest tests by experts, Experiment Stations, Fruit Growers and Farmers, is today publicly pronounced a wonderful success. That is because this vaporous, fog-like super-spray is the ONLY spray fine enough to reach the millions of tiny, UNSEEN *hidden* pests that infest microscopic niches in bark, buds and foliage—where no coarse, heavy, low-pressure spray can reach. These hidden pests wipe out millions of dollars' worth of fine fruit each year. They cost Fruit Growers an appalling toll. Yet Fruit-Fog positive *thoroughness* will exterminate every one of them. This explains the fact that thousands of Fruit Growers and Farmers now credit their clean orchards, mighty yields and record-breaking profits to Fruit-Fog Spraying. Send the coupon and get the complete story today.

HAYES FRUIT-FOG SPRAYERS

Fruit-Fog Spray is produced by the Hayes 300 lbs. guaranteed high pressure and the scientific Hayes nozzle. Fruit-Fog, because of its vapory fineness, has wonderful *adhering* power. No drops form—no solution wasted—no buds or leaves knocked off—as with a heavy, coarse, low-pressure spray.

Hayes Sprayers are famous for combining speed with utmost thoroughness and lowest consumption of solution. They are skillfully made and every part is positively standardized to the closest limits of accuracy. Thus is obtained enduring service and greatest efficiency under high pressure. The famous Fairbanks-Morse "Z" Engine assures Hayes users the best possible service.

Sprayers for Every Purpose

Hayes Sprayers are made to meet every Orchard, Field, Garden, Park, Disinfecting, White-Washing and Cold Water Painting need. No matter what your sprayer requirement from our great Triplex Fruit-Fog Power Sprayer to the smallest Garden Atomizer, we make it.

Send for New Book and Spraying Guide FREE

Tell us how many trees you want to spray and how old they are on the average. Also what other uses you have for your sprayer. We'll tell you where and how you can get the style of Hayes Sprayer best suited to your needs, and its price. We'll also send our Big New Book of Hayes Sprayers and our Valuable Sprayer Guide FREE. ol. LIV, No. 5 Los Angeles, January 31, 1920 One Dollar Yearly

s First Consideration Due American or Japanese?

By C. B. Messenger

MERICANIZATION has won one victory in the campaign to preserve California's lands for Americans. The im-rtation of women to act as farm la-rers, a movement which is contrary the agreement made with Japan, s been, or rather will be, terminated soon as the large number of women w contracted for can be landed in s country. It took a hard fight, and, range as it may seem, it has caused me little contention on the part of r own people, to bring this about. ere are many other steps which st be taken before America can be nsidered safe for Americans. But nator Phelan says: "When the ople are informed they are always ht." So it seems the only way to se-re our own protection is by a cam-ign of education.

As to "picture brides" Mr. Phelan marked in a recent address:

"It is true that I have agitated the bject and have done so from the ginning, because I believe that pub-opinion is the great force in Amer-an political life. What was the re-lt? When I visited the immigra-n station at Angel Island and saw e Japanese 'picture brides' flocking in violation of the 'gentlemen's reement' and going into the fields th the men as laborers and increas-g the birth rate to enormous propor-ns, I helped to arouse that public inion which resulted the other day the abolition of the 'picture bride' il. When the evil was understood e moral forces of the community re aroused to the extent that the kio government beat a hasty re-at. The only way of getting any rther concession or to compel a rict enforcement of the law is to ep agitating. When the people are formed, they are always right. They w know that it is a matter of self-eservation.

"In December, 1916, when the last migration bill was under considera-n, by amendment I safeguarded it far as possible from preventing any cession by the Japanese of their reement to keep out coolie labor, d I am now pressing my own bill absolutely exclude Japanese labor-s, believing that the 'gentlemen's reement' is inadequate. I have suc-ssfully worked for appropriations r the bureau of immigration to pro-ct our greatly exposed border and w, as the final thing to be done, I ve urged my constitutional amend-ent, which denies citizenship to Jap-ese children of American birth by niting such citizenship to white, ack and red races.

"There is now pending a new im-igration bill which I believe I can eatly strengthen as the disposition congress is ripe against the further vasion of the Pacific Coast. I urge e people of California to at once itiate the necessary legislation. We ve won one victory by cutting off e 'picture brides' and we can win other victory by preventing the rther absorption of the soil, and rhaps recover what we have lost."

Senator Phelan has been doing some od work and it is receiving the en-rsement of the great majority of r people, but there are occasionally ose who oppose it—we believe peo-e who are lacking in vision and in preciation of the trend of these rld movements. We doubt not one the strongest supporters of the panese in their fight to colonize in is country is John P. Irish. Com-enting on our recent editorial and quotation which we made from the s Angeles Times, Mr. Irish writes:

By John P. Irish

Your San Diego correspondent, who avoids responsibility by concealing his name and identity, reports that an educated Japanese told him that the word of the Japanese was not to be relied on and that Americans cannot hold real estate in Japan. Will your correspondent please give us a bill of particulars? Who was the educated Japanese who impeached the honor of his countrymen and released so much misinformation?

As a matter of fact, Americans do hold real estate in perpetuity in Japan, just as real estate is held here; that is to say, as long as they pay the taxes on it, and their tax is the same as that paid by Japanese.

You quote the Los Angeles Times, accusing the Japanese of controlling the food production here and so causing the high cost of living.

Do you not think it better to get accurate information before writing on this subject, and then tell the truth?

Japanese raise 23 per cent of our green vegetables, 20 per cent of our potatoes, 13 per cent of our beans, 10 per cent of our rice and 9 per cent of our corn.

Potatoes are high, but in Minnesota and Michigan, for the week ending January 5 the farm price of potatoes was $3.80 per cental. In Colorado and Idaho it was $3.85 to $4.10, as reported by the Market Reporter, published by the agricultural department at Washington. See your own market report, issue of January 17—Idaho potatoes in Los Angeles $5.35 to $5.60 per cental. These prices extend east to New York, Philadelphia and Boston, for potatoes that no Japanese ever saw. You must remember that I am a farmer and in 1919 my ranch produced 500 acres of potatoes, and it is my business to know things about that useful crop.

Again the Times says that in spite of the gentlemen's agreement the Japanese come in by tens of thousands yearly to the agricultural districts of California. Where does the Times get that stuff? Certainly not from the official reports of the federal immigration service. In 1918 just 2,604 Japanese laborers came into this country, including those returning from a visit to Japan and the parents and children of those already here.

Verily, Ananias was not the only man who could make figures lie. There are in California 7,973 Japanese farmers and 15,794 farm hands and 5.070 so called picture brides. This is the "horde" against which the politicians, who eat their bread in the sweat of the taxpayer's face, are organizing just such a pogrom as the Russians start for the purpose of murdering the Jews.

Japanese births—see report of the board of health—are seven per cent of the births in the state. There are 1,000,000 white women of breeding age in California to 5,070 picture bride Japanese. I bet on the white women winning.

The last official report I got shows in 1917 in the eight Southern California counties 19,182 white and 1,642 Japanese births.

The Times is logical in one respect. It has a solution of the Japanese and farm labor problem by bringing in a million Chinese coolies to work on the land. Let me correct the Times in this, that Chinese coolies do not work on land and would be worthless here for that purpose.

We once had Chinese farmers here and the same breed of ill smelling politicians that are now lying about the Japanese started an anti-Chinese pogrom. We then proceeded to rob the Chinese. We destroyed their property. We murdered them in our streets. We burned to death 120 of them in one night like rats in a straw stack. We closed these fine proceedings by grossly violating our treaty with China and expelling and excluding them. Does the Times know what followed? It was a shortage in farm labor and an economic vacuum which drew in the Japanese. Something else happened, for 568,943 acres of farm land that had produced food was abandoned and its tillage ceased. The Japanese here have not filled the vacuum caused by our inhuman treatment of the Chinese. The Times is not wise. It is helping on an anti-Japanese pogrom that will end in expelling those people and the abandonment of more farm land, and it will not get the parasite politicians to consent to admit Chinese."

Mr. Irish says the Japanese raise 23 per cent of "our" green vegetables. Just what he means by "our" we do not know. But if he will turn to the cover page of the Cultivator of January 17 he will note the statement that 85 per cent of Los Angeles' vegetables are grown by Japanese. What the percentage is for the city of San Francisco, for the state of California, for the Coast, or for the whole country we have no figures available. To an extent we are influenced by our own immediate surroundings, and noting our own danger we endeavor to arouse our people to the danger which confronts the entire country.

Also we note Mr. Irish gives no dates for these figures other than in referring to the labor question he says he gathers his figures from federal immigration report for 1918. But on that point he writes. "The Times says that in spite of the gentlemen's agreement the Japanese come in by tens of thousands yearly—where does the Times get that stuff? Certainly not from the official records of the federal immigration service."

Most assuredly the Times did not get these figures from that service. In fact, that was exactly the point that was being made in that editorial, that the wonderful rapidity with which the Japanese population of California is increasing is little realized by the people generally because the increase is not known by immigration officials. But Mr. Irish is not in the class which fails to realize this fact notwithstanding his efforts to hide behind federal "statistics." If Mr. Irish had read the California Cultivator of October 25 he would have seen there a statement given to the federal senate by Commissioner on Immigration Caminetti and signed by John W. Abercombie, assistant secretary of labor, to the effect "that during the 12 months ending June 30, 1919, the agents of the federal government apprehended 9678 Japanese who were in the country illegally and secured their deportation." This we followed with a bit of pertinent comment by McClatchy of the Sacramento Bee:

"Those figures refer to the ones caught and convicted; it is fair to assume that at least an equal number escaped detection and were added to the constantly swelling Japanese population of the Pacific States. No account is taken of the number of picture brides who arrived and are diligently following the biblical injunction to be fruitful and multiply."

Americans do not fear a square honest fight, but do dread an insidious foe who steals upon us in the guise of amiability and friendship. We are informed that no foreigner can obtain title to land in Japan. In 1913 a law was passed providing that foreigners may acquire land in fee simple in Japan—if citizens of countries which permit same right to Japanese. These rights were to be determined by reciprocal treaties. This law has never been put in force by Imperial edict. Foreigners may lease agricultural lands for 25 years only.

IMPERIAL VALLEY A JAPANESE PROVINCE!

"Peaceful penetration" is penetrating more and more every day, excepting in the case of some people's heads. A score of yars ago the Imperial Valley was perhaps the most absolute of all American deserts. Through American capital and American pluck it has been reclaimed and made one of the richest producing sections of California. It is now fitted to the needs of the Japanese, and they want it and are trying to drive a shrewd bargain by agreeing to remain away from other sections of California if they may be given exclusive privileges there. At least, here is the statement made by Senator Phelan:

"Just before I left Washington, an American, representing powerful Japanese organizations, and said to be backed by the Japanese government, proposed as a solution of the Japanese question, that Americans be ousted from the Imperial Valley, all Japanese in California and along the coast be segregated and shipped to the valley and allowed to own and till its fertile lands.

"He said the Japanese, being accustomed to hot weather, would thrive in the valley where it is too warm for white men; that if I would give my approval to the plan he would be glad to take it up with the interests he represented and that this scheme appealed to him as being practical and sensible.

"Just exactly how he planned to dispossess the large and small farm owners and depopulate the cities of the magnificent valley, he did not make clear. In fact it was a feeler, as I see it, to determine the attitude of the people of the valley through me.

"My attitude on this subject is so well known that I was amazed to think he should approach me on the subject. Naturally, I told him emphatically that such a plan was absurd on the face of it and that this offered not the slightest way out of the Japanese problem. However, I think it is interesting in view of the present agitation on the coast against the Japanese as a land holder and business man."

Agricultural News Notes of the Pacific Coast

Northern California

Owing to the drouth many cattle are being forced onto the market.

Los Molinos, Tehama County, has organized a farm loan association.

Antioch and Walnut Grove are shipping out about 20 cars of celery daily.

University farm officials report beneficial results from summer fallow.

Butte County wool growers recently made shipment of 21,000 pounds of wool.

The markets of San Francisco report that during 1919 $9,000,000 worth of eggs passed through that city.

Tehama County is planning to extend its rice acreage, several immense pumps having been installed for irrigation.

There has been more trapping in this state for fur bearing animals during the past year than any preceding year.

Many Alameda County wineries disposed of their entire stock before January 16 and closed their doors forever.

A large acreage of Sutter Basin will cease to be grain bearing land and hereafter bear Bartlett pears and prunes.

Farm picnic at university farm, Davis, will be held Saturday, April 24. Fifteen thousand were present at 1918 pienic.

Farm advisers of Butte, Glenn, Tehama and Shasta recently met at Chico and discussed the marketing problem.

Chico, Butte County, high school is planning practical farm operation, one of the features already secured being a tractor.

Mr. Negley, a promoter of cow testing associations in Wisconsin, will soon establish large dairy near Escalon, San Joaquin County.

Fifty Eldorado County farm bureau people recently called at the state farm at Davis and investigated practical agricultural conditions.

Owing to inabiltiy to secure nursery stock many planters are contracting for next year's and even the following year's delivery.

Rice men of the Sacramento Valley are endeavoring to secure more perfect harvesting machinery and better warehousing to prevent great loss of grain.

The chamber of commerce of Livermore, Alameda County, has an active committee at work investigating possibilities of reclaiming large acreage through irrigation.

Sonoma County's board of supervisors is going after people careless with fire and will require permits for all brush and trash fires from the period of June 1 to December 1.

Sacramento County Cow Testing Association has been competing for prizes totaling in value nearly $3,000. Awards were made at a banquet recently held at Sacramento Y. M. C. A.

Warehousemen in the rice growing portions of the Sacramento Valley have agreed to prices which will be accepted by the growers and the matter will probably not go before the railroad commission.

The supreme court has reversed decision of a lower court in the matter of fence laws. In effect the supreme court has ruled that the owner of stock which causes damage on another's property is responsible for such damage.

Central California

1920 Raisin Day will be April 30.

Bakersfield is planning for a big Kern County fair next October.

Kern County farm bureau is conducting a membership campaign.

Fresno chamber of commerce has issued a bulletin on cotton planting.

One Fresno County grower of persimmons is finding sale for his dried fruit.

Madera County's farm productions for 1919 aggregated more than $11,000,000

California will precede all states in establishment of a soldiers' settlement. This is located at Delhi, Merced County.

Madera County anticipates a great increase in its output of Thompson Seedless grapes.

Kern County hog raisers held a meeting at the court house at Bakersfield last Monday.

Some Valley growers will attend the Western Fruit Jobbers Annual which will be held in San Francisco next week.

Cotton growers of five San Joaquin Valley counties are taking steps looking toward the formation of a permanent association.

Tulare County fat hog auctions have been bringing around $15 per hundred, which is a slight increase over earlier prices.

Alviso, Santa Clara County, apple growers do not like the restrictions of the standardization law and will contest its constitutionality.

Grape growers at Dinuba are buying carloads of old ships' hawsers which are cut up and reduced to their strands and used in tying grapevines.

An organization has been formed in Sacramento looking toward Asiatic exclusion, the first step being to secure special session of the legislature.

The fig institute recently held at Fresno organized a fig marketing association with F. W. Yoakum, president and Ward B. Minturn, secretary.

G. A. Turner has retired from the presidency of the California Bean Growers Association. J. Lee Mendenhall has been elected to succeed him.

Tulare County farmers are taking steps to compel Japanese farmers who have purchased lands in the name of Japanese infants to prove the legality of their guardianship.

The farm bureau cow testing department of Stanislaus County is testing 975 cows, with one passing the 80 pound mark per month and many of them producing better than 70 pounds.

Great extension of irrigation pumping in San Joaquin Valley has made extension of power plants imperative and the San Joaquin Light and Power Company is asking permission to increase rates.

Farm bureau auction sales in Kern County: Wasco, February 7; McFarland, 14; Bakersfield, 21; Wasco, March 6; McFarland, 13; Bakersfield, 20; Wasco, April 3; McFarland, 10; Bakersfield, 17.

Tulare creameries paid producers: L. A., 79 cents for churning cream, 81 sweet cream, 92 basis for whole milk; Dairymen's Coop., 71½ fat (total amount fat handled during month 84,686 pounds); Good Luck, sweet cream 81, churning 77, whole milk 92.

Southern California

Almond trees are blooming in Banning, Riverside County.

Northern Orange County is planning for associated chambers of commerce.

One Hemet grower netted $104 per ton for fruit delivered to cooperative cannery.

The California Walnut Growers Association reports all first grade walnuts sold.

Riverside is suggesting the planting of cotton along the lowlands of the Santa Ana River.

Farm bureau directors of Riverside County will make exhibit at the National Orange Show.

The Covina Citrus Growers Association has determined to work this season on the one pool plan.

W. W. Van Pelt has been re-elected secretary and manager of the Southern California Fair at Riverside.

A branch of the California Lima Bean Association has been established at Van Nuys, Los Angeles County.

Riverside city council will appoint a tree warden, or forester, to have control of all street and park trees.

General extension and improvement of pumping plants and irrigation lines is being made because of the continuation of the drouth.

The citrus experiment station at Riverside will make most comprehensive exhibit at the coming orange show February 13-23.

Commissioner Ryan of Los Angeles County is making general campaign on gophers, and the county farm bureau is aiding in the campaign.

Elsinore, Riverside County, is fighting the proposition to drain the lake near that town. Certain irrigation interests are pushing the drainage plan.

Walnut growers of Southern California plan erection of headquarters and packing building which, with equipment, will cost around $2,000,000.

The Santa Ana Canyon highway built by Riverside and Orange Counties is now closed to heavy trucking pending the laying of concrete foundation.

Anaheim, Orange County, has a citrus expert who offers his services in inspecting, advising and helping the grower to make his grove a money maker.

A new highway from Santa Monica north along the ocean front through the Malibu ranch is being constructed under direction of the state highway commission.

The manager of the California Lima Bean Association is in the East investigating marketing conditions. But little over 20 per cent of the Limas have been sold.

Francis Cuttle has been re-elected head of the Tri-Counties Reforestation Committee. This committee does effective work in Orange, San Bernardino and Riverside Counties.

Citrus growers are finding that while their crop will be smaller than last year the quality is exceptionally good and they are hoping for long prices keeping up the total returns.

The farm school made possible by act of the last state legislature has finally secured a site in Riverside. A tract comprising 300 acres has been secured, and first payment of $20,000 has been made.

The Coast and General

Idaho potato growers are holding at $100 per ton.

Oregon has almost 1,000,000 acres under irrigation.

Roseburg, Oregon, is to erect a $20,000 prune packing plant.

Oregon produced about 6,000,000 pounds of cheese in 1919.

Eastern Oregon and Idaho onions are selling at $140 per ton.

Grain growers of Washington met at Pullman, January 21-22.

Pacific and Northwest milk dealers meet at Portland February 3-5.

Western Washington is conducting an egg laying contest at Puyallup.

The first big public sale of Durocs is scheduled at Salem, Oregon, February 4.

Wool producers of Washington mee in state convention at Walla Walla this week.

Oregon has called a special session of the legislature to enact anti-Japanese laws.

Oregon farmers are appealing for a law which will protect buyers o commercial feeds.

Loganberry growers of Marion County, Oregon, have sold their 1920 crop at eight cents.

Yakima Bartlett pear growers received $1.91 net per box, or $86.90 per ton for their 1919 output.

Whatcom, Washington, cow testing association is being reorganized with a membership of 600 cows.

The Oregon State Drainage Association recently met at Corvallis. A. T Harris was elected president.

The Duroc-Jersey breeders of Oregon are planning for a big show and state convention to be held in Salem February 4.

Arizona oranges and grape fruit are to be exhibtied at the National Orange Show to be held at San Bernardino February 13-23.

Cotton growers of Tucson, Arizona are organizing. It is expected that the acreage in Pima County will be about 8,000 for next year.

Seattle, Washington, recently forwarded its 21st car of fresh eggs for New York. Shipping stock is now reported exceptionally scarce.

Reclaimed swamp lands in Washington are difficult of cultivation because of the continual coming to the surface of logs buried long years before.

Sugar beet growers of the West convened in Denver Monday, January 2 It is hoped that a country wide organization was formed which will enable beet farmers to cope with the trust

Two weeks' instruction in farm engines and use of farm power will be given at Washington state agricultur college at Pullman beginning Saturday of this week and continuing until February 14.

San Saba County, Texas, market this season over a half million dollars worth of pecans. One hundred carloads have already been shipped. One tree produced this season $295 worth of nuts.

Farmers of Washington are complaining bitterly because of the ruling of the Great Northern Railroad in refusing to give cars to transport apples to Pacific ports in order to secure water shipment.

Truth in Fabric Law Introduced in Congress

By National Sheep and Wool Bureau

HON. Burton L. French of Idaho introduced the "Truth in Fabric" law in congress January 7. This act would make it compulsory to identify shoddy cotton in cloth and clothes, and would free the wool grower from unfair competition with shoddy and would protect the public against those who would sell shoddy as virgin wool and charge virgin wool prices for it.

The following table graphically shows the root of the cause of the present exorbitantly high prices of clothes. This table also shows why fabric manufacturers divert from the wool grower to the shoddy and rag industries the people's demand for virgin wool.

The Truth in Fabric law introduced by Mr. French would right this wrong.

Why Clothes Are So High

Showing how the fabric manufacturer, by failing to tell the wholesale merchant to whom he sells the fabric that the fabric contains shoddy, is able to secure from wholesale cloth merchant the unjust price of $15 for an all wool woolen suit length of three and one-half yards containing 80 per cent of shoddy, which, because it contains 80 per cent of shoddy instead of being all virgin wool, the fabric manufacturer could have profitably sold for $10 and for which the wholesale cloth merchant would not have paid more than $10 had he known that the cloth was 80 per cent of shoddy.

Also showing how, without any profiteering on the part of the wholesale cloth merchant or the retail merchant, the unjust price of $5 charged by the fabric manufacturer more than doubles by the time the public is reached.

Please note that the same percentage of markup, 60 per cent, is used in the case of both basic prices on which computations are made, namely:

1. The fabric manufacturer's price of $10, which is the legitimate price he should have charged the wholesaler.

2. Fifteen dollars, the unjust price, which he was able to secure only because he permitted the wholesaler to believe the fabric was made exclusively of virgin wool.

Price at which suit length could have been profitably sold by fabric manufacturer to wholesale cloth merchant	$ 10.00
As an example—if normal and legitimate markup of wholesale cloth merchant were	60%
	$ 6.00
	10.00
Wholesale cloth merchant's price to retail custom tailor	$ 16.00
As an example—if retail custom tailor's normal and legitimate percentage of markup were	60%
	$ 9.60
	16.00
Retail custom tailor's legitimate price to the public	$ 25.60

Unjust price which fabric manufacturer was able to secure from the wholesale cloth merchant, only because he permitted the wholesale cloth merchant to believe he was purchasing a fabric made exclusively of virgin wool	$ 15.00
As an example—if normal and legitimate markup of wholesale cloth merchant were	60%
	$ 9.00
	15.00
Wholesale cloth merchant's price to retail custom tailor	$ 24.00
As an example—if retail custom tailor's normal and legitimate percentage of markup were	60%
	$ 14.40
	24.00
Retail custom tailor's legitimate price to the public made necessary by the $5 excess and unjust price of fabric manufacturer	$ 38.40

The Truth in Fabric law not only would free the people from the monstrous deception and wrong of being forced to buy shoddy against their will and being forced to pay virgin wool prices for it—this act would also emancipate the wool grower from the shoddy deception and wrong which has had sheep husbandry by the throat for the past 20 years.

The following was passed unanimously at the annual meeting of the Fleece Wool States Growers Association, held Tuesday evening, December 2, at the Stock Yards Inn, Chicago, Illinois:

Whereas, a large part of the raw material used in manufacturing woolen fabrics and apparel sold as all wool is shoddy, and not virgin wool as the public believes;

Whereas, the public does not suspect that the term all wool may mean wool that has previously been used in cloth;

Whereas, the term all wool is a mere general term that may include shoddy;

Whereas, even the most inferior shoddy may be all wool;

Whereas, the term all wool, because it fails to distinguish between shoddy and virgin wool, places both the public and the wool growers at the mercy of fabric manufacturers; deprives the people of their right to choose between shoddy and virgin wool; deprives the people of the knowledge of whether they are purchasing shoddy or virgin wool—the knowledge that is the people's sole protection against those who would charge virgin wool prices for shoddy; and thus robs the public and wrongs sheep husbandry;

Whereas, the unrevealed presence of substitutes, especially shoddy, in fabrics and clothes abrogates the law of supply and demand, places a premium on deceit and profiteering and violates economic law and outrages moral law;

Therefore, be it resolved, that this Association of Fleece Wool States earnestly urge, in the interest of truth and justice, and for the protection of both the public and sheep husbandry, that the United States at the earliest possible moment enact legislation making it compulsory to make known the presence of substitutes for virgin wool, especially shoddy, in fabrics purporting to contain wool and apparel made from such fabrics; and in order that this worthy object may be speedily accomplished in the interests of all the people, we request the earnest cooperation of all who desire to see right prevail and honest practice established in all branches of business.

Grape Mealybug

TONS of grapes were discarded and serious loss suffered by table grape growers of the San Joaquin and Sacramento Valleys last year because of the depredations of the grape mealybug. The matter was discussed by R. L. Nougaret at the last state fruit growers convention, and at that time he gave a most hopeful view of methods of control which would be devised. This is the period of the year when the habits of this pest should be thoroughly understood, for control measures at this time are worth far more than at harvest season. Prof. Nougaret is now with our state department of agriculture, but in 1918 when he was with the federal department, but stationed in California, he furnished to the state commission of horticulture an article touching upon life history of the mealybug, effect of the honeydew upon the grape and control measures. This was published in the monthly bulletin of the commission, Vol. VII, No. 9. We quote:

By R. L. Nougaret, Formerly Deciduous Fruit Insect Inventigations, Bureau of Entomology, U. S. D. A.

This species of mealybug is commonly found on grapes in the Counties of Fresno and Kings, and to a lesser extent in Tulare. Some few instances of infestation have been discovered in Merced and in San Joaquin Counties, and one as far north as Red Bluff.

With a view to controlling this pest, the United States bureau of entomology has had this subject under investigation for some time, and while some of the experiments have given satisfactory results, others, under similar conditions, have failed to do so, and at this time no method sufficiently tried and reliable can be recommended as a control. Nevertheless, so far enough has been accomplished to offer suggestions as to conditions to be avoided to curtail the spread of the insect, and to uphold the standard of excellence of the table grapes for shipping purposes, which is the aim of the California fruit standardization act, while awaiting final and conclusive experiments for a practical means of combating this pest.

Notes on Life History

A brief outline of the life history and habits of this insect will explain its classification as a pest, and the nature of the damage caused to the grape which may be said to be strictly commercial and but slightly horticultural. This species of mealybug is not particularly adapted to the grape. It is omnivorous, and apparently thrives well on a number of plants. Among these may be cited, citrus trees, pear, walnut, and some ornamental plants grown in open air as well as in hothouses. It also thrives well at times on certain species of bulbs, and on roots, when exposed above ground, and as this insect is strictly aerial, does not go below the surface of the ground.

This mealybug is better known to the grape grower and the casual observer when in the adult stage, because of its diminutive size when first hatched and when young. From the time it is hatched, until adult, it changes but very little in form and appearance. The almost mature, and adult stage, of one brood closely corresponds to grape picking time. This is especially true for the Malaga and Muscat grape and those varieties of the same ripening period.

It overwinters in the larval stage. It begins hibernating immediately after hatching in September-October, and remains the same size until it begins feeding in March-April, during the period of the ascension of the sap in the vine. It hides in crevices and under the loose pieces of bark where it has access to the cambium layer on which it settles down and feeds. It does not move about unless disturbed, or after molting, when it often moves away to a place quite distant from where it remained during the previous instar. The individuals of this brood attain maturity in June, oviposit during this month, and the larvae hatching from these eggs are the first brood of the year. They feed on the green tender canes and leaves and are found in the bunches of grapes when adult, or when almost full grown. The individuals of this brood far outnumber those of the over wintering one.

This species of mealybug is oviparous. The eggs, an average number of 125, are deposited within a white mass of silky threads termed ovisac or egg-sac, from one-fourth to five-eighths of an inch long, and about one-third as wide as long. The egg is pale orange yellow in color almost always with a more intense orange coloring at one end, when first laid, which blends gradually into a uniform coloring of the eggs of a slightly darker hue. The egg is 0.4 mm. or 16/1000 of an inch in length. The eggs hatch ordinarily in from a week to ten days after being deposited, but in the fall, they may take as long as two weeks. There are two distinct generations a year. Oviposition occurs in the periods June to July and September to October.

Honeydew is an excrementitious product of the mealybug. It is colorless, viscous, of the consistency of honey, but slightly more fluid, and very sweet. It is adhesive, and collects in drops varying in size from a pin point to that of very small shot. On the surface of a leaf it will sometimes spread as a coating, but rarely does so on the surface of the berries.

The mealybug causes little or no damage to the vine, although it is a sucking insect, nor can stunting, or

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

WANTED: SPUDS

Wanted: a thousand cars of seed potatoes. Planters are continually asking: "Where can we get seed?" The seed dealer shrugs his shoulders, holds his hands high and answeres: "Where?"

NEW HEAD U. S. D. A.

President Wilson has made a change in his official family, David F. Houston being retired from the agricultural portfolio and made secretary of the treasury. The new secretary of agriculture is Edwin R. Meredith of Des Moines, Iowa. Mr. Meredith has been for many years owner of one of the larger farm papers of the Middle West. He has been connected with the present administration in the treasury department.

MORE ABOUT OLIVES

For once we have a common sense investigation. The food department of the state of Pennsylvania became concerned regarding rumors of the poisonous qualities in certain canned olives, so it investigated and investigated thoroughly. Hundreds of cans of California ripe olives were opened. Not the faintest indication of anything of a poisonous naturo was found. In a word, the decision rendered hy the Pennsylvania health board was: "Eat California ripe olives."

DOWN IN JAVA

Dr. Creamer of the Island of Java is investigating fruit growing, or rather agricultural conditions, in California. He is enjoying our climate and we would we might enjoy some of the climate of Java—in California—for a short period. There the rainfall sometimes is 50 feet per year, and now and then in a case of extreme good fortune the precipitation has reached two meters, or nearly 80 inches, in a period of 36 hours.

Oh for a transfer of some of Java's climate for a few minutes.

COOPERATION WINS

The campaign for new members which has been conducted by the California Prune and Apricot Growers, Inc. has won, and hy a safe margin. This is a compliment to the management, a greater one to the members who have allied themselves with this movement which had saved the prune industry and been a great factor in the stablizing of the apricot industry. But, as strong as the organization was, the original members became tired of holding the sack while the industry was saved, so they demanded and secured a recognition of the principle of cooperation on the part of those who were remaining outside the organization.

PLANT A GARDEN

During the war we planted gardens. Lawns were spaded up; flower beds eradicated in order to grow a few ears of green corn, a few radishes or heads of lettuce, or sometimes, even to grow weeds. So far as we can figure the matter out the patriotic urge is as great today as it was during war activities, and certainly the H. C. of L. was never stronger. When one sees at the roadside market, cauliflower heads little larger than a goose egg marked five cents and a really respectahle head marked 25 cents it is time to plant a few seed, and tomorrow it will be time to hoe and to irrigate and to care for the tiny plants. So plant a garden and then till and water.

MILLIONS FOR TRIBUTE

Friend Richardson, California's state treasurer, will soon be unpopular with the politicians of the state. He has a peculiar idea that in the matter of economy the state of California is not different from an individual:

"The individual must, if he avoids insolvency, live within his income. Many people desire, but few can afford to ride in Pierce Arrows. The state is no different from an individual. The champagne appetite of the prehprohibition era must be avoided by the state. .The state has not an unlimited fund to draw upon. State thrift is as necessary as individual thrift.

"Now is the time to call a halt on state expenses. If new sources of revenue are found, the fight of those who believe in a wise and economical expenditure of state funds will only be made harder, and the greed of those who look upon the state to finance their private schemes will he greater."

The demands on the state treasury last year called for the handling of more than $100,000,000. Of course, another ten or 20 millions added next year means but little, but at the same time some of us are foolish enough to suggest to Mr. Richardson that he continue his campaign and give us some more facts.

Somewhere else in this issue there is a suggestion that when the people are informed they are usually right. Let us be informed on some of our state's expenditures.

IRRIGATE

Hundreds of thousands of fruit trees all over Belgium and in eastern France were destroyed during the war. While those countries purchasing power will not be great they must have some fruit. Thousands of acres of Eastern peach orchards have given way before the dread yellows. California is planting new orchards, so far as she can secure the trees, but she is not giving as much careful attention to preservation of the old orchards as she should. We do believe, however, that so far as permitted by the shortage of labor, the orchards of the state never had the careful attention they are receiving today. Unless greatest care is exercised, it now appears many a tree will suffer from want of moisture before the coming fruiting season has passed.

This is a good time to store moisture in the soil. Where wells will permit or where streams have sufficient flow waters should be applied. Heavy winter irrigation will not only save the crop but possibly the life of the tree. Irrigate deeply and hold the moisture with perfect tilth.

GASOLINE SHORTAGE

One has only to take a Sunday afternoon ride or stand by the roadside and observe the continuous procession of automobiles to wonder when the supply of gasoline will be exhausted. Even now it is becoming difficult for truck and tractor operators to secure a sufficient supply of distillate. Gasoline is still to he had and kerosene is plentiful, but very few of the engines are fitted for burning kerosene. Now comes the secretary of the interior and director of geological survey with warning that a most precarious situation confronts the users of farm power. Gasoline is being marked up in several of the Eastern centers.

In part the present situation is due to confiscatory decrees of the Mexican government. In effect these prevent all American companies from sinking more wells unless they agree to Mexican government ownership of the entire properties of the company. The importations to this country from Mexico have been reduced by 200,000 barrels daily, and the production in Mexican petroleum fields has been reduced more than a million gallons a day. As 90 per cent of the fuel oil used on the Atlantic and Gulf oil consuming vessels has been derived from the Mexican fields, it is plain that disaster confronts users of farm power and the industries unless the Mexican situation is quickly cleared. And here is a significant fact of interest to farmers: "The country today uses more gasoline than do the cities; the rural pouplation is its biggest buyer."

SALES AND SALE VALUES

Perhaps no one thing marks the growth of the pure bred livestock industry in this state during the past two or three years more than the lengthening sale list of the current season.

The large number of public sales is made possible by the quickened demand for a more efficient class of livestock on the part of the ranchers of the state who have been convinced of the practical value of better blood. This demand is certain to continue and the surplus produced by the breeders must be disposed of in two ways, namely, by private treaty and puhlic vendue. Which method is the best suited to the seller will depend upon local conditions. It matters little which method is used as in the end the principles of selling are the same—success in either case coming to those who are honest with their customers and who give value received.

Because of the very nature of the auction, being conducted in public, the seller needs to be scrupulously careful that nothing occurs to cast reflection upon himself or his herd.

A long observation of puhlic sales is convincing that the seller who has truthfully advertised his offering need have no misgiving that the average crowd can be depended upon to set true values. It is possihle that the values so estahlished may not equal the seller's idea, in which case it is more than likely that an exalted opinion as to values has clouded the vendor's judgment.

We simply mention the above in passing as a caution to sellers who may be disappointed at the apparent lack of appreciation that may be manifested at a few of the sales.

SALE RING PRACTICE

Speaking of sales, we hope the livestock interests read the two quoted articles under the heading of "Sale Ring Ethics" in the Cultivater of last week. The articles in question, written by men of wide experience, were pleas for the introduction of more business like methods in Eastern sales.

The public sale is a business transaction and nothing more and there is no real reason why sales of livestock should not be handled on a plan acknowledging as much.

Some men may attend sales to be entertained by the flashing ? wit of the auctioneer and assistants in the ring—but those men seldom buy, and the real buyers prefer an auctioneer who commands respect because of his ability and knowledge of values. Again, few buyers care to be surrounded and importuned by a half dozen "ring men" whose sole claim to such designation is the fact that they are permitted within the ropes.

So far, California sales have not been cursed with such tactics, and at the first sign of the ring man epidemic the breeders should take a positive stand—limit their sale force to one good auctioneer and not more than one assistant. The buying puhlic will appreciate such a stand and the selling expense be held within bounds.

GET ACTION

The Cultivator has referred so many times to the necessity for forest and watershed protection that it may seem superfluous to urge it further, but as the season so far has appeared somewhat dry there is at least a bare possibility of enormous losses being visited upon California unless every step is taken to protect from the fires which come even in the best of years. Effort should be made by every California well wisher to secure greater care in this fire prevention.

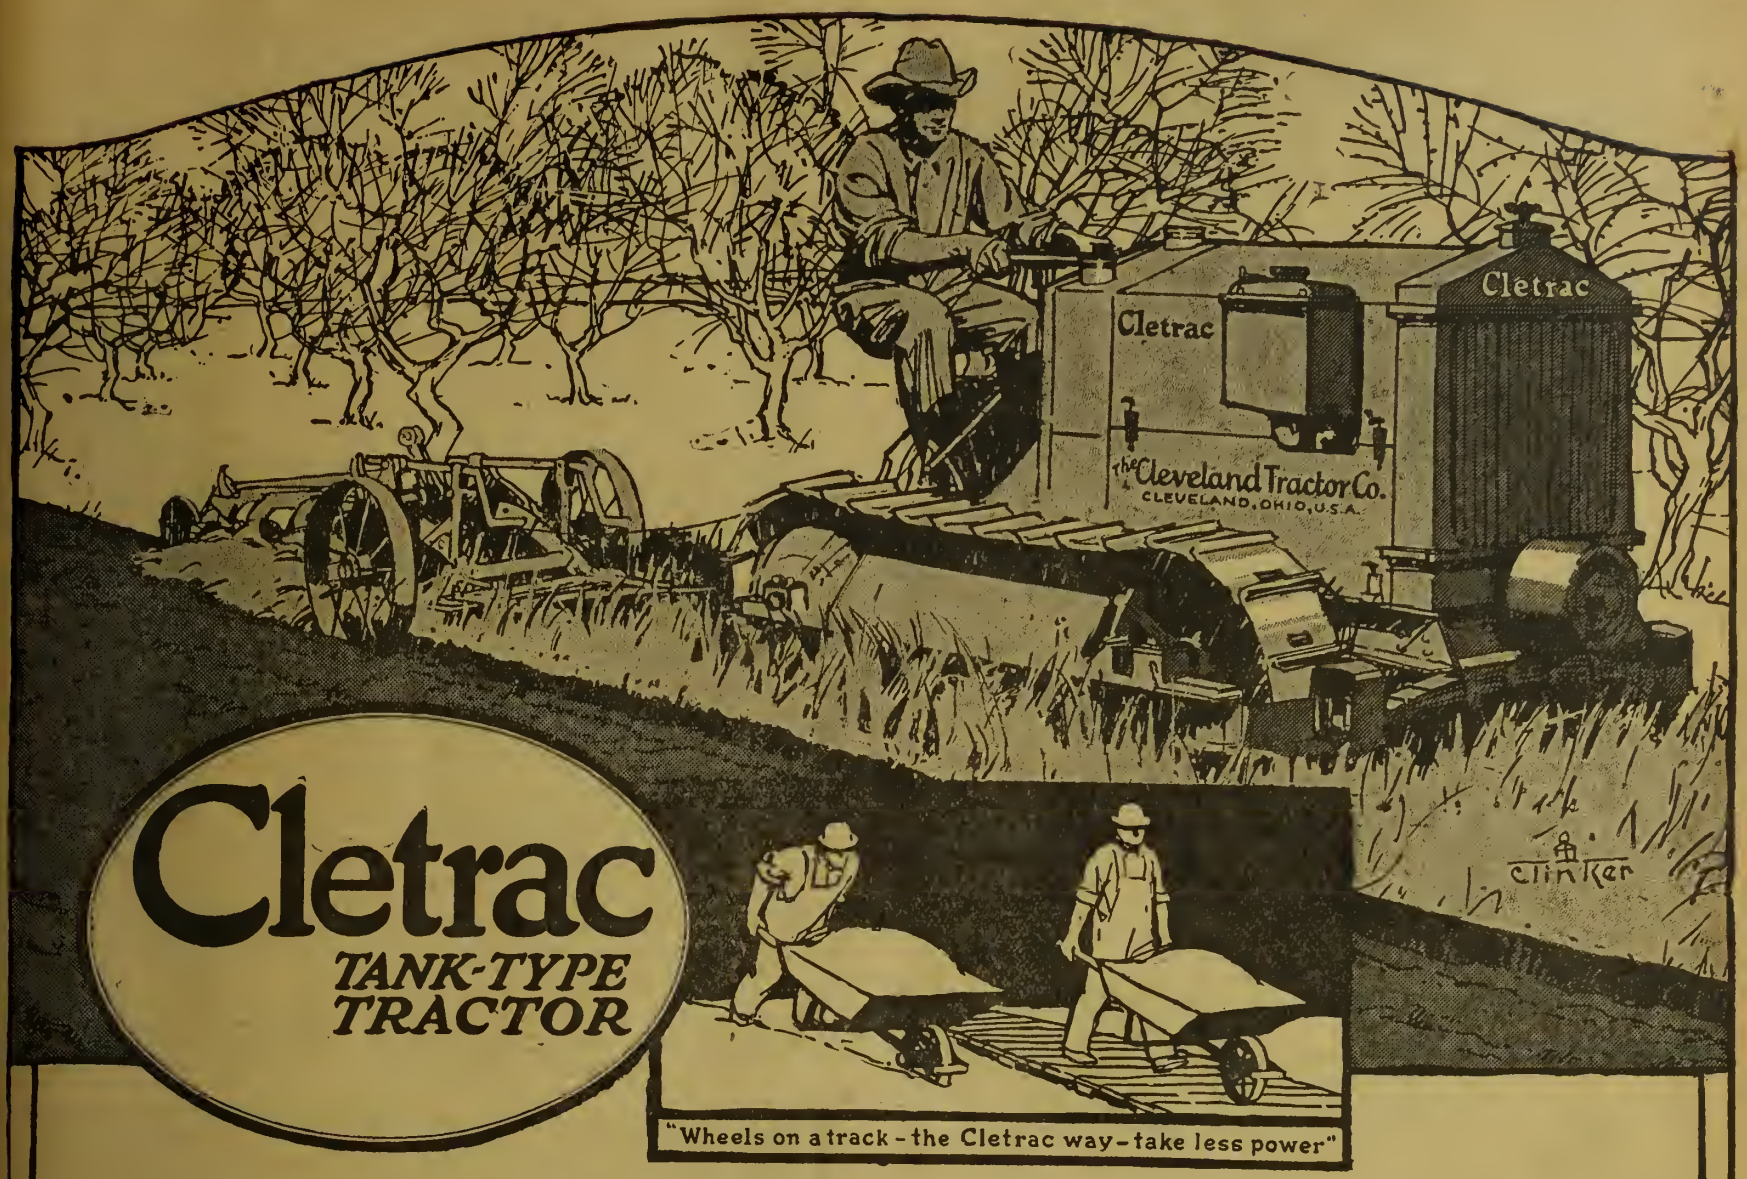
The state board of forestry recently met in San Francisco and has made other recommendations which will advance the state's welfare and wealth Here are four specific recommendations as the result of that meeting:

Appropriation by the state legislature of sufficient funds for the prevention and suppression of forest, grair and pasture fires outside of nationa forests.

Acquirement of logged off areas both in the redwoods and pine forests as a nucleus of state forests for future timber supply.

Acquirement of watersheds necessary for the conservation of water fo domestic and irrigation purposes.

Renowal of forests on logged of areas and watersheds that are in nee of reforestation.



In the Orchard—with a Cletrac

Plow your orchard better this year—put a Cletrac on the job.

Small, powerful, easy to run—working every day, 24 hours a day if necessary—the Cletrac plows closer to trees, quicker and at a lower cost.

Laying its own endless tracks, the Cletrac travels the orchard floor with a light, sure foot and a strong, steady pull.

Low-hung, with no projections—it weaves in and out and around trees without injuring bark or branches. Turns short—gets the corners, works in the sticky places—goes everywhere, with power to spare.

The Cletrac rides on top of the soil—doesn't pack it. That's why it's so good for discing and other mellowing jobs.

Spraying, ditching, fertilizing, road building, operating cooper shops and cider mills—these are but a few regular Cletrac jobs. All the year around—any time, anywhere—it does all your haulage and belt work. Operates perfectly on distillate or kerosene.

The Cletrac costs less to operate than any similar power unit or the six or eight horses it replaces—works more hours a day and more days a year, too.

Be ready when the rush comes—get your Cletrac now.

Write today for that interesting booklet, "Selecting Your Tractor"—it's free

"Buy Dynamite"

"You wear out more spades, Jim, than any other man in the county. I'll bet your back's worn out too. Digging holes to plant trees is all right if you need the *exercise* or if you *like* to spend your money for hired help but if I were you I'd cut out the hard work and keep my money in the bank by *blasting* the holes for my young trees with

HERCULES DYNAMITE

"Look at Bill, there. He's got the right idea. He's bought dynamite from me for the past fifteen years. Now he's got one of the biggest and best orchards in the state. And he has a fine fat bank roll, too—all because he uses Hercules Dynamite to help him with his work.

"Send to the Hercules Powder Co. for their 68 page illustrated book, 'Progressive Cultivation.' This book tells all about using dynamite for tree planting, clearing the land of boulders and stumps, blasting ditches, subsoiling, cultivating your bearing orchards by blasting between the rows and hundreds of other ways of using explosives to help in heavy farm work.

"Take my advice, and send for this book. *It's free* to ranchers and fruit growers."

Hercules Dynamite is for sale at leading dealers.

HERCULES POWDER CO. 1033 Chronicle Building, San Francisco, Cal.

Planet Jr. Seeders, Wheel-Hoes and Cultivators will enable you to do as much work as three to six men using ordinary, out of date tools. They cultivate thoroughly, rapidly and properly. Planet Jr. tools are made with scientific accuracy, and of the best materials. Fully guaranteed.

No. 25 Planet Jr. Combined Hill and Drill Seeder, Double and Single Wheel-Hoe, Cultivator and Plow sows all garden seeds from smallest up to peas and beans, in hills or in drills, rolls down and marks next row at one passage and enables you to cultivate up to two acres a day all through the season. A double and single wheel-hoe in one. Straddles crops till 20 inches high then works between them. A splendid combination for the family garden, onion grower or large gardener.

Planet Jr.

No. 17 Planet Jr. is the highest type of single wheel-hoe made. It is a hand machine whose light, durable construction enables a man, woman or boy to cultivate the garden in the easiest, quickest, and best manner.

FREE 72-page Catalog Illustrates tools doing actual farm and garden work and describes over 55 Planet Jrs. including Seeders, Wheel-Hoes, Harrows, Horse-Hoes, Orchard, Beet and Pivot-Wheel Riding Cultivators. *Write for it today.*

Cooperation Again a Winner

THE California Prune and Apricot Growers Inc. determined either to fish or cut bait, so they proceeded to cut bait, and now they are fishing. In other words, the campaign for adding to the membership 20,000 acres of prunes and 6,000 acres of apricots has proven successful and on January 20 the association announced it would continue to function as a growers non-profit selling agency. Commenting on the campaign President Coykendall says:

"The prune and apricot growers of California have saved cooperation and prosperity for themselves by guaranteeing the continuance of the California Prune and Apricot Growers, Inc.

"The majority of the growers in the state always have been in favor of cooperative marketing. It was a small minority who were standing in the way of the success of this association and who had to be convinced in the recent campaign of the necessity of supporting this organization. If they had so willed the minority had it in their power, by refusing their support to overthrow the efforts of the majority to establish a growers non-profit marketing organization which would insure all the growers of the state a square deal and a fair price for their fruit.

"This state association of the prune and apricot growers has done more for the industry in less than three years of existence than had been done by scores of well intentioned local organizations since the beginning of the industry. At the time this organization was founded prune acreage could be bought for $500 an acre. Today this same land is selling at $1,500 an acre or more. This year the prune and apricot growers of the association will receive about $25,000,000 for their crops. Five years ago they would have been lucky to get one-third this amount for the same fruit.

"The association has established for the growers more than 250 selling agencies, most of them in the United States, but a score or more located in foreign countries where new markets are being developed for the large crops expected in the next few years The association has launched an advertising campaign which is bound to create a tremendously increased demand for the association's fruit from consumers in the United States. The association has built a by-product plant where small sized prunes and apricots are made into jam, fruit butter and other specialties which will permit the growers to receive a much higher price for very small sized fruit than would otherwise be possible.

"If the growers had turned down their association in the recent campaign and the association had gone out of business as a result all of this prosperity would have been lost to them, and under the shadow of such a catastrophe no one would dare prophesy how long it would have been before another attempt would be made to rebuild a cooperative selling organization of the growers.

"Next to the formation of the association this is the greatest victory the fruit growers have won for themselves. The association is bound to grow stronger from now on, and farmer cooperation has taken a long step forward."

Outlets Found for Wine Grapes

GRAPES from the wine sections of California are likely to find a number of outlets never thought of while the making and selling of wine was permitted in the United States. Several such outlets were indicated by experiences during the vintage of 1919, according to specialists of the United States department of agriculture who recently visited the wine grape regions. The problem, however, is still a big one. Not only are uses and markets to be found for the product of 175,000 acres of wine vineyards, but for the considerable portions of table and raisin varieties that formerly were made into brandy. The leading variety of raisin grape, the Alexandria, usually has a heavy second crop which matures too late for drying, and this was formerly used in brandy making. Of the leading shipping grape, the Flame Tokay, only the best clusters are usually shipped for table purposes, and the inferior clusters were converted into brandy. Now other markets must be found for the culls of raisin and table grapes.

During the past season there was a very heavy demand at high prices for anything that could be called grapes. Only a few growers, therefore, attempted experiments in finding new uses, and these few experiments were incomplete, but they indicate probably satisfactory results when they are more fully tried.

Many Shipments to East

At least 4,000 cars of fresh wine grapes were shipped into the eastern states and made into so-called non-alcholic wines and grape syrup. A gallonage of unfermented juices was made, a large per cent being pasteurized and put up in 50 gallon barrels. Much of this has already been shipped East.

Considerable work was done in sun drying and dehydrating wine grapes, and the product found a ready market at prices much higher than those paid for raisins.

Important grape varieties that have been imported and tested by the United States department of agriculture have paved the way for some new features of the grape industry. Among them are a number of varieties of shipping and storage grapes that are considered superior in every way to the varieties heretofore grown in this country. Some of them ripen at the same time as varieties now grown, some earlier and some later thus offering the opportunity for greatly extending the grape marketing and consuming season. In addition, a much larger demand for table grapes can be created than has existed up to this time, because the new varieties have superior eating qualities. One of these is annually imported from Europe in considerable quantities in late winter and sold at high prices. It thrives so well in California that it could be sold at prices considerably under those of the imported product and still net the grower a good profit.

Large Importations Supplanted.

The work of the department of agriculture has shown also how to fruit the Ohanez, the best keeping variety of all storage grapes. This should make it possible, with California grown Ohanez packed in redwood saw dust to supplant large importations of Ohanez and other Almerian grapes packed in cork dust.

The department of agriculture has also demonstrated that currant grapes can be grown in this country by grafting on resistant stocks and girdling the vines while they are in bloom From 4,000 to 8,500 acres of these grapes would be needed to produce the 34,000,000 pounds of dried currants imported annually during the decade previous to the war. In some districts where raisin varieties are so late in ripening that they can not be dried the currant varieties ripen early enough to be dried and put away before the first rains come. In districts where the raisin varieties succeed currants, it appears probable, can be grown as an advance crop and cured and stored by the time the raisin grapes are ripe, thus furnishing a longer and more profitable period of employment for the labor that must be kept in raisin vineyards.

In the distinct dry wine districts where many of the vineyards are on phylloxera resistant stocks, regrafting can be done with other varieties, where the vines are not grafted too near or below the ground. Where there are vineyard plantings of resistant stocks they can be grafted to such varieties as are found most desirable.—C. C

GRAPE MEALYBUG

(Continued from Page 161.)

suffering, of canes or leaves he detected due to its presence. The grapes appear to be in no way affected in their development, in acquiring normal size, and in percentage of sugar even when heavily infested. In fact, if any bunches of grapes on a vine are infested, they invariably are the ripest, sweetest and best of the first crop. The mealybug is found in bunches of the second crop, as a rule, only when the infestation of the vine is severe.

The damaged caused by the mealybug consists only in a depreciation of the market value of grapes because of the filthy condition of the hunches due to the presence of the insect. The honeydew forms a sticky mass with the white flocculent egg-sacs, and the white cast skins of the second and third or last molt. A few insects only within a bunch gives it a repulsive aspect, and render it unfit for human consumption. Grapes such as these may be dried, but make an inferior raisin. The best use for them is the distillery.

Unless bunches of grapes are heavily infested the insect is seldom seen on the berries of the outside of the bunch, but its presence is detected by the honeydew which it excretes on the outside berries from the position it occupies, settled down and feeding on the pedicel of the berry, lateral stems, or even the main stem of the bunch of grapes. Honeydew even in small quantities is proof of an infestation, hut no indication of how severe a given infestation may be. The degree of infestation can be ascertained only by opening up the bunch, although there does exist, in a way, some relation between the quantity of honeydew on the outer berries and the degree of infestation within the bunch of grapes.

Relation of Honeydew to Packing

Because of the difficulty of judging the degree of infestation of a bunch of grapes by the quantity of honeydew on the outside berries, bunches with only a mere trace of honeydew should be excluded from the pack and should not be disposed of by putting them into the box set aside for culls, but should he taken away from the packing shed without delay. For the same reason, which will be explained later, boxes known to contain "honeydewed" bunches of grapes, if only one, should be refused admission to the packing shed. The task of preventing "honeydewed" grapes from becoming mixed with clean bunches should begin in the vineyard by the growers instructing the grape pickers to be on the lookout for bunches soiled with honeydew and restraining the pickers from putting such grapes in the picking boxes. The infested bunches should be picked and let fall to the ground.

Conditions best suited to the mealybug are, shade and seclusion, and protection from bright light, wind, and sudden change of temperature. These conditions are found under the vine close to the trunk crown, and the bunches of grapes further provide succulent food. When a bunch of grapes is picked, these conditions change, the insect becomes restless and will leave the bunch sooner or later and crawl about in the box; it may hide in some crack or crevice of the hox, or crawl away from it to some other place, or box, when boxes of grapes are piled up in tiers and thus left standing for some time, as is the practice in packing sheds. Picking boxes are the surest and most frequent means of spreading the insect, either to other parts of an already partially infested vineyard, or to new localities as yet free from the mealybug. It will therefore be seen why special attention and precautionary means should be taken in the packing shed.. These may be enumerated as follows:

Exclude from the pack all bunches showing signs of honeydew; because the true condition of the interior of the bunch can not be estimated without spreading the bunch apart.

Boxes containing "honeydewed" grapes should be refused entrance to the shed. If taken in, and later discovered, they should be removed without delay.

In the interest of both growers and packers alike, boxes which have contained "honeydewed" bunches, whether one or more, should be disinfected.

For lack of practical experiments, none as yet having been made for the

disinfection of boxes, the following suggestions are offered, rather than methods advocated:

Fumigation by means of hydrocyanic-acid gas. One ounce of sodium cyanide per 100 cubic feet of space in gas-tight enclosure. Length of exposure should not be less than two hours.

Dip boxes in boiling hot water, or subject them to a jet of steam so as to reach every crack, crevice and all surfaces of the box.

(We doubt not if Prof. Nougaret were making recommendations today he would say to use liquid gas where it is available.—Editor.)

The use of sulphur fumes has been advocated, but is here mentioned with reserve. Its efficiency as a killing agent for the mealybug should be given a thorough test. Use five pounds of sulphur to 1,000 cubic feet of space. All the sulphur should be thoroughly consumed. Exposure should last several hours.

MEALYBUG FUMIGATION DEMONSTRATION

A meeting was held at Sultana, Tulare County, January 17, by R. L. Nougaret of the office of viticulture, state department of agriculture, with the horticultural commissioners of Tulare, Fresno and San Joaquin Counties and their assistants for the purpose of giving a practical demonstration of how to fumigate with sulphur fumes for the control of mealybugs on grape vines. There was also a number of grape growers who were present.

This mealybug has been spreading during the last few years at a rapid rate and becoming a very serious pest. At grape picking time most of the insects are in the bunches of grapes and the honeydew they produce with other waxy secretions soils the grapes so that they cannot be used for human consumption. In 1918 a great quantity of Malaga grapes was condemned as unfit for table grapes. Much concern is felt about this pest in the southern counties of the San Joaquin Valley.

It is of special importance that fumigation by means of sulphur fumes be carried on at night and with strict observance of certain rules because the fumes are very injurious to plant life. But if carried on as advocated, this method is very simple and trustworthy and practically amounts to an eradication.

PEAR GROWERS ASSOCIATION

At the annual meeting of the California Pear Growers Association held in San Francisco the following board of directors were reelected: R. J. Coggeshall, Courtland; R. C. Dorsey, Courtland; F. A. Edinger, Hood; James F. Elliot, Courtland; Peter J. Huth, Vorden; Henry C. Malone, Napa; R. D. Meyer, Huntington Park; E. C. Rand, Santa Rosa; E. A. Smith, Concord; Frank T. Swett, Martinez; F. A. Wilcox, Santa Clara. Frank T. Swett was reelected president, F. A. Edinger secretary and A. D. L. Hamilton assistant secretary.

The members of the association grew $2,200,000 worth of pears, of which half were sold to canneries, the remainder being dried or shipped East. For the cannery pears an average of $85 per ton was received for the best grade; for Eastern shipments, which were sold at auction, no price being set, from $90 to $100 per ton was received and for windfalls which were dried $35 per ton. The association has encouraged canning and the largest pack of pears on record was put up, a considerable portion of which has been exported to Great Britain.

President Swett in his address called attention to the fact that while in the last ten years an average of 80,000 tons a year have been grown, in the next ten years there will be 150,000 average, and by 1929 over 300,000 tons a year will be produced.

A national advertising campaign is planned to commence as soon as 80 per cent of California pear growers enroll as members, along similar lines to the growers of oranges, prunes, almonds, walnuts and beans.

IMPORTANT GRAPE MEETING

A meeting of grape growers is to be held at San Jose February 7 in the chamber of commerce auditorium from 9:30 a. m. to 4 p. m. under the auspices of the division of agricultural extension of the University of California, college of agriculture, with representatives of the California state department of agriculture and of the Grape Growers Protective Association. The subject of evaporators in connection with the drying of wine grapes will be fully gone into and discussed, and papers will be read.

In view of the problem of disposing of the 1920 wine grape crop, this meeting is of the utmost importance for the wine grape grower and a large attendance should be present.

AVOCADO OBSERVATION

The bureau of chemistry, United States department of agriculture, has under observation at different stations in Southern California crops of avocados, some of which are picked once a month and taken to the laboratory. A general analysis is then made to determine the composition, and the variation of composition from green fruit to mature fruit will be known at the end of these tests. We will then know definitely at what date and stage of development to pick these fruits to get them at their best food value.

Seven varieties have been under observation during the past season, one "official" tree of each which none other than the chemical staff are allowed to touch. These trees and their locations are: Fuerte and Taft, at Yorba Linda; Dickinson, at San Diego; Blakeman, at Altadena; Puebla, at San Fernando; Spinks, at Duarte; Lyon, at Whittier. Another season it is hoped to include the Sharpless, completing the eight varieties first recommended by the avocado association. Doubtless those varieties will then be observed that the association believes promising. All are tested at the citrus by-products laboratory at Los Angeles.—E. B.

CONSERVE THE FLOODS

There is one benefit which may come from this season's rain shortage and that is the possible bringing together of irrigators to conserve flood waters of wet years for saving millions of value in dry years.

Commenting on the Pine Flat conservation plan the Farm Bureau Monthly of Fresno, says:

"The organization of the proposed Consolidated Irrigation District is progressing well. Thousands of acres have been added since the last farm bureau meeting. The Kingsburg district has more than doubled its acreage, also the Del Rey district has done likewise, and other parts of the district have been active in securing signatures during the past few weeks.

"The day before New Years, one man in the Selma district secured over 1,000 acres. Opposition to the district has practically disappeared, and it is now only a question of the solicitors seeing the land owners and they will sign the petitions.

$1000,000. can be saved every year

Do you know that thrips are capable of doing over a million dollar's worth of damage a year in California to the fruit industry? It's a fact—and what's more, its preventable.

We have absolute proof that thrips can be controlled by proper spraying with Universal Brand Miscible Oil No. 2.

It is a high gravity oil designed for this particular purpose. It has a very high degree of penetration—it goes right into the fruit and leaf clusters—and gets 'em.

Miscible Oil No. 2 will kill thrips better than any other spray mixture — there's no question about it. Ask your neighbors what their experience has been.

And write today for our bulletin on deciduous spraying —it contains much valuable information for your guidance.

County bee inspectors of California recently met in Los Angeles and organized a state association.

"We have another dry year in prospect, and possibly enough will be lost this coming season, as was lost the last season, to pay for our part of the proposed Pine Flat dam. Therefore, every year we delay this matter only means a multiplication of the losses sustained by the farmers."

WANTED: A NAME

The Oregon Growers Cooperative Association, which controls 16,000 acres of fruit in Oregon, has opened a national campaign for a name. A hundred dollars is offered for the first prize, and $50 for the second prize, for the best suggestion for a brand name. The Oregon Growers Cooperative Association will sell all kinds of fruits, such as apples, prunes, pears, berries, cherries, walnuts, dried and canned fruits. The name must be one which can be applied to all. Since the organization is a state wide organization, the name must not be localized, but must be appropriate to the entire state. The contest will close April 1. All names should be sent in to C. I. Lewis, Organization Manager, 307 Masonic Building, Salem, Oregon.

GRAFTING WORTHLESS WALNUTS

Referring to Mr. Neff's article on walnut grafting, J. M. Colley of Santa Paula writes:

"I have just read your article on walnut grafting, the article in today's Cultivator is of very great interest to me at the present time as we have about four acres of walnuts, set six or seven years ago and interset with apricots. The walnuts have proved to be entirely worthless, as they do not bear, and what few nuts there are have little or no meats in them, and mostly go for blows. There have been several orchards of this variety planted, but have mostly been dug out. I would like to graft them over, as if I could get other trees to replace them, which seems to be impossible this season, they would grow slowly among the apricots; but what is worrying me is that the walnut trees to be grafted come out very late in the spring and are late all season. In your opinion would the trunks hold back the sap and keep the grafted head late or kill off the scion the first season? The trees now in are budded low down on black walnut."

Mr. Neff, who wrote the article referred to, answers:

"The grafting of another variety of walnuts on the present stock will not change the habits of the new scions any more than the trees already growing were changed by being grafted on black walnut roots. The wood of the trees now growing is likely harder than that of the scions you will use. More care will have to be given in placing the scions so as to secure circulation of the sap but otherwise there will be nothing different from the care needed when scions are placed in black walnut or in soft shells."

SELLS CITRUS LAND

The recent public sale of lands on the Yuma Mesa, Arizona, which are described as particularly adapted to the growing of citrus and other semi-tropical fruits, was a decided success. The total of the sales amounted approximately to $1,250,000, and buyers were present from all parts of the country. One tract of 60 acres was purchased and will be developed by army officers from Washington, D. C. About 1,700 acres of the first unit remained unsold at the close of the auction, and Secretary Lane has authorized the reclamation service at Yuma, to receive bids for these farms until June 10, 1920, unless sooner disposed of.

WILLING TO PLEASE

John's father kept a candy store, and the little fellow often brought candy to school to divide with the other children. One morning the teacher noticed a strong smell of peppermint and began to investigate in order to stop eating during school hours. Unable to detect the culprit she bent over small John and whispered:

"John, have you any candy?"

"No, ma'am," he replied.

"Have any of the other boys any?"

"No, ma'am."

As she turned away he touched her hand and said: "I bring you some at **noon."**

TOP DRESSING TALKS, No. 9

FEED YOUR CITRUS ORCHARDS

Dr. C. B. Lipman of California Experiment Station and an authority on the fertilization of the citrus, writes in California Circular No. 170 concerning the soils of San Joaquin Valley and those of the southern valleys of California, as follows:

"The best representative of the high grade nitrogenous fertilizers for the class of soils under consideration here is Sulphate of Ammonia.

"In citrus orchards it is best to apply Sulphate of Ammonia in from three to five applications employing about one pound per tree per application in the months of February, March and April, or similarly January to May."

THE CAR OF ECONOMY

GRANT SIX

Economy is a relative term. Many people confuse economy with cheapness. But to the thinking man or woman there is little chance for such confusion of ideas. For economy is not cheapness. The things which cost least are often most wasteful. And wastefulness is never economical.

The Grant Six is an economical car. It is a high grade motor car. It delivers exactly what buyers of its type want. It brings you beauty from which springs a feeling of pride in ownership. It brings you satisfactory performance, quick acceleration, marked flexibility, hill climbing ability, ample power.

It brings you riding comfort. It brings you dependability founded on correct engineering and high grade construction. It brings you freedom from worry because of its substantial construction. It brings you freedom from costly repair bills.

Its simple, accessible mechanism requires little time or effort to look after properly. Its makers have incorporated in the Grant Six design every known feature that will contribute to your comfort, pleasure and permanent satisfaction.

Its light weight insures low tire cost, low gasoline cost, and its great strength insures long life.

Therefore, because it brings you what you want at an honest, fair price, because it brings you real value for every cent of your investment, it is a truly economical car.

Write for new illustrated catalogue and name of Grant Six dealer in your community.

Rat Farming

By F. L. Tomaschke

I WENT to a farmer friend one day to buy some little chickens. He thought over the proposition very seriously for half a minute; then he said:

"No, I don't know as I can spare you any. I've only about three-four hundred. And there's a couple of hawks that have headquarters somewhere 'round here and come to see us most every day. Then there's maybe two dozen rats under the barn. I calculate to keep them well fed up; and I don't know as I'll have any more'n they'll want."

There is doubtless a great deal of pleasure and profit in rat-farming—for the rats. For the farmer and his family and the community at large there is nothing but annoyance, loss and danger. The amount of grain and other feed annually destroyed by rats and mice is incalculable, especially in regions where the farmers and warehousemen still cling to the antiquated sack handling method. For the ugly little pests gnaw into the sacks as they lie in the field, in piles near the buildings, and, worst of all, in the barns and warehouses; and when the sacks are next handled to and from the wagons and cars the contents pour out through these holes. The grain spilled in this way is worse than wasted, for it helps to feed the least useful of birds and to breed and multiply the rats, mice and squirrels.

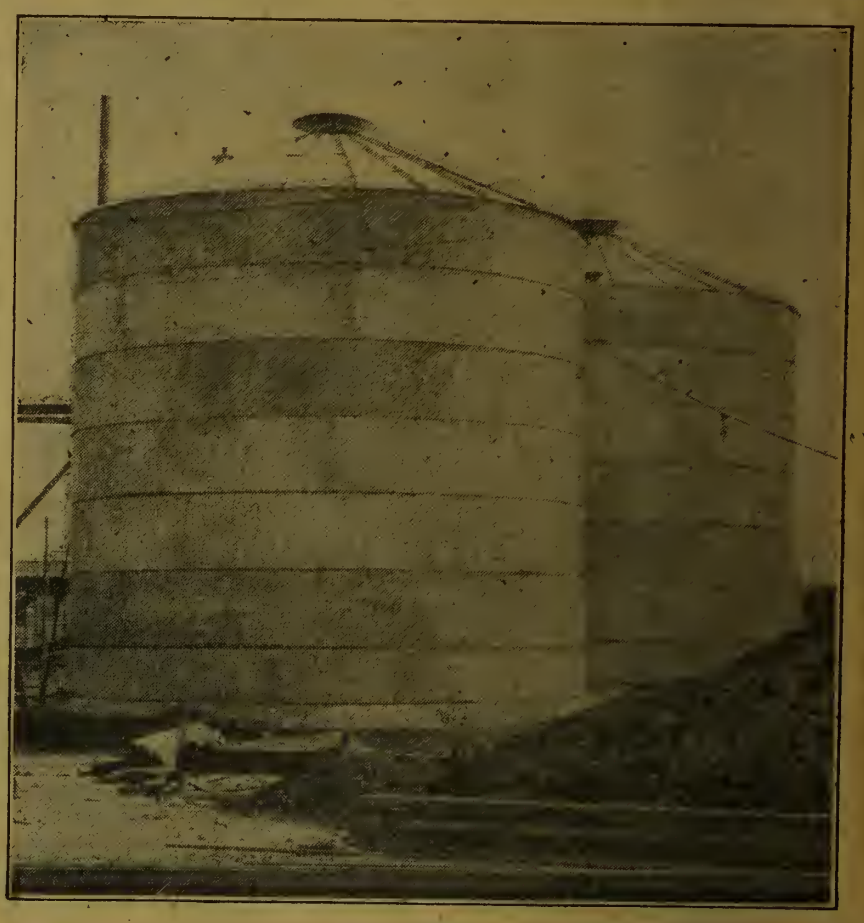
Cats and terriers, traps and poison are all very well as far as they go. The trouble with them is that the rats, especially the older ones, are about as cunning and crafty things as ever go on four legs. They are as cunning as a weasel and as foxy as a fox. In a short time they learn the character of all these devices for bringing them to sudden death and learn to avoid them. Campaigns of this sort are often successful in killing a large number of rats; but among the victims it will be found that the young ones are in the great majority. The sly old veterans remain to rapidly propagate their kind.

Modern science is locating one by one the sources of many of the ills against which humanity struggles in the germ life carried by flies, mosquitoes and other parasites and vermin. Rats and other rodents are found to be a principal means for spreading bubonic plague and also pneumonic plague or Spanish influenza. Plague ridden countries are always rat ridden. Thus methods of extermination become the eager study of medical and sanitary scientists and an important activity of public health departments.

The most effective and permanent methods yet devised are the doing away of breeding and nesting places by concreting or otherwise rat proofing basements, cellars and foundations of buildings, abolishing wooden floors in barns, warehouses and stock buildings which are so placed as to cover a dark, shallow space which affords the nasty little thieves a safe harbor, and placing all grain and other feed in metal bins and containers.

Professor Dixon of the University of California department of zoology points out that neither rats, mice nor squirrels are ever found in large numbers except where food is abundant, and that the use of metal bins and other containers is effective in keeping down the rat and squirrel population in two ways, first, by preventing their rapid propagation, and second, by making them more willing to eat poisoned grain and fruit.

It will probably never be possible to wholly exterminate rats and mice and other vermin pests of the farm. Some wily individuals are bound to escape the most determined campaign, and their breeding season in a favorable climate like that of California is all the year round. It is feasible, however, to keep their numbers down to small limits and to put a wholesome fear of man and his works into the brains of the survivors. This state of affairs will doubtless be found on the wisely conducted farms of the future.



No Rats In Here
Galvanized iron grain bins, Crocker Huffman Land and Water Company ranch at Merced.

EUROPEAN CORN BORER

The experience of the past season with the European corn borer leads the United States department of agriculture to make the statement that, apparently, there is little justification for alarm over the possibility of this insect's becoming a menace to the corn crop throughout the entire country. While the corn borer is a pest to be reckoned with and one that may cause considerable injury to susceptible varieties of corn in certain localities, its effect on the corn crop of the country as a whole, especially in the corn belt, is unlikely to be serious.

These reassuring facts have been discovered as the result of the department's work during the past season:

Up to the present time the corn borer has inflicted considerable damage to corn only in the Boston district where the corn grown is of the sweet and dwarf varieties and where the

AUSTIN

Farm Ditcher, Terracer and Road Grader

A machine that will completely solve your drainage problem. It cuts a V-shaped ditch to the depth of four feet. Sides of the ditch slope at an angle of 45 degrees and will not cave in or wash to any extent.

The Austin Farm Ditcher also grades roads and keeps them in repair, backfills ditches and terraces hillsides.

Reversible blade of all steel construction. You will find the Austin Farm Ditcher the most useful implement on the farm.

IRON AGE

Farm, Garden and Orchard Tools

Answer the farmers' big questions: How can I grow crops with less expense? How can I save in planting potatoes? How make high priced seed go farthest? The **IRON AGE Potato Planter** solves the labor problem and makes the best use of high priced seed. Means $5 to $50 extra profit per acre. Every seed piece in its place and only one. Saves 1 to 2 bushels seed per acre. Uniform depth; even spacing. We make a full line of potato machinery. Send for booklet today.

corn borer, owing to the climatic influence of the gulf stream, is two brooded. After ten years of slow spread the insect has attacked occasional fields of sweet and flint corn, under conditions favoring multiplication of the borer, to the extent of nearly 100 per cent of the stalks and 20 to 50 per cent of the ears. However, in most of the fields in the area now invaded in coastal Massachusetts and New Hampshire, the injury has been negligible. When the corn borer larvae are limited to the stalks, the ears, as a rule, are normal. Even when the larvae enter the ears, the injury is certainly not greater than that caused by the ordinary corn ear worm, which is reckoned at about seven per cent by weight of the kernels of each ear attacked.

The European corn borer is now known to occur over the entire coastal region of Massachusetts, including Cape Cod and adjacent islands, and over several towns in southern New Hampshire, approximately 1,800 square miles; in New York, in the Mohawk Valley between Amsterdam and Albany, about 800 square miles; in western New York, over an area of at least 500 square miles, and the area of known infestation is constantly expanding as the survey proceeds; and over a limited area in Erie County, Pennsylvania.

PERMANENT EXPOSITION

At the annual meeting of the Sixth District Agricultural Association officers for the year 1920 were elected as follows: E. W. Murphy, president; Frank Simpson, vice-president; Albert M. Paul, secretary. The board of directors are E. C. Bellows, R. W. Burnham, Marco Hellman, Clinton E. Miller, E. W. Murphy, Dell A. Schweitzer, Frank Simpson and Walter P. Story.

The state exposition building at Exposition Park in Los Angeles is under the management of this board. Complete, classified exhibits representing the entire state are being installed and when completed the Exposition Building will contain the finest exhibit of the kind in the United States.

Cooperation is being accorded by commercial organizations, resort people, and those who realize the value of having at Los Angeles a permanent exhibit epitomizing California and from which may be gotten a knowledge of actual conditions throughout the state.

MAKING SURE OF BINDER TWINE

The United States has long depended for much of its supply of binder twine on henequen from Yucatan. The uncertainty of the supply during the past several years has caused serious anxiety lest there should not be enough binder twine to harvest the increasing crops of grain in this country, and the United States department of agriculture has been making diligent efforts to find new sources of supply or new regions where binder twine fibers may be produced. The chief of the bureau of plant industry reports encouraging results. The conditions in limited areas, extreme Southern Florida and on the larger keys are regarded as suitable for the production of sisal and henequen fibers, provided the cost of land and of labor is not too high to permit successful competition. Henequen has been cultivated successfully for several years in Cuba and the plantations are being increased, but thus far they produce scarcely enough fiber to supply the cordage mills on the island. Conditions are regarded as favorable for the production of binder twine fibers in limited areas in Haiti and over a much larger area in southern Santo Domingo. Experimental plantings in Porto Rico have resulted in the establishment of a commercial plantation near Yauco and trial plantings near Quebradallas and on Mona Island have given promising growth. In the Virgin Islands excellent conditions for the cultivation of sisal have been found on St. Croix. In the Philippines the introduction of modern fiber cleaning machines has resulted in increased planting of sisal and private capital has bought and installed machines to develop the industry on a larger scale.

A weed is any plant in the wrong place. Vegetables too close together are as injurious to each other as weeds. Thin them out before they are large enough to crowd.

Roderick Lean

For A Perfect Job of Discing

WHEN your discing is finished, what will the verdict be? Can you say—"well sir, there's a real job of discing"—or must you look at work half done?

The Roderick Lean New Century Single Disc Harrow gets down deep and does the work right. It pulls easily at an even depth, slicing and pulverizing each clod, stirring and mixing each foot of ground ***for a perfect job of discing.***

AUTOMATIC ENGINE DISC
Built in 8, 9 and 10 ft. sizes. An automatic, leverless double disc specially built for tractor use only. Gangs are automatically angled by draft of the tractor without stopping or dismounting.

"NEW CENTURY" ENGINE DISC
Furnished in 5, 6, 7 and 8 ft. sizes for use with lighter tractors. Built extra strong for power use. Operated from tractor seat by two levers within convenient reach. Adjustable hitch suits any standard light tractor.

Spring Tooth Harrow
Has heavy, one-piece angle steel frame with extra runner plates to prevent wear, long spring teeth of special steel, and special adjustable tooth fastening device. Good clearance and light draft.

Steel Lever Spike Harrow
The first steel spike tooth harrow ever built, and the best known and most widely imitated. Every ounce of special steel. Every section surrounded by strong channel steel frame, braced at two corners and center. Cannot twist.

This famous farm tool is backed by twenty years' experience in disc harrow building. Built for light draft, yet strong enough for the toughest discing. Notice the special center pressure adjustment operated by foot lever as pictured above. This makes easy the cutting out of dead furrows, ditches and working over hard, uneven ground.

Built in all sizes from 4 to 10 feet, with 16 or 18 inch round discs.

Your dealer will show you this disc. See him, or write direct for complete information.

Dayton Airless

Puncture Proof AND Easy Riding

Put Dayton Airless Tires on your car now and forget punctures, blowouts, pumps and patches. Seven years of service has proven their success and reliability. Over 100,000 are in use today. They don't bounce like a tight pneumatic nor d-r-a-g like a loose pneumatic. They are easy riding—and wear till there's nothing left but shreds.

Equip Your Ford

or any other car using 30x3 or 30x3½ sizes. No spare tire needed. Thousands in use on light delivery cars. Send coupon for booklet and prices.

Excellent Territory Open

We have a splendid proposition to offer to business men in every county where we have no agent. Mail the coupon for the facts.

This Tells the Story

I have used a set of Dayton Airless Tires, getting 44,000 miles out of the front and 20,000 miles out of the rear tires, the difference in mileage being due to my overloading my Ford Touring Car by hauling three barrels of oil constantly. I used the tires constantly, nearly three years, and Dayton Airless Tires make no difference in the wear and tear of a car. I find the engine and steering apparatus as good or better than the average car of like age.

And the satisfaction of knowing that when a person starts he can get somewhere without distress of both body and mind by punctures, blowouts, and loss of time is a compensation in this age of progress for any difference in price. The fact is, in the long run, the cost of Dayton Airless is about half the pneumatic cost.

PLANT Fruit Trees

We Specialize in Fruit Bearing Trees

We grow our trees in the choicest spot in California—Fresno. Here in Central California the most favorable climatic, soil and water conditions prevail, making possible the production of superior trees and vines. Added to this is our intimate knowledge of the business which enables us to exercise the most intelligent care in growing and handling nursery stock.

You should have our catalogue. Our descriptions of varieties are more complete and comprehensive than in any other book. It tells you what you ought to know in order to select trees intelligently. Sent free on request.

Fertilizer for Walnuts

Kindly advise me through the Cultivator as to whether a high grade commercial fertilizer such as is used on orange groves would be beneficial on a nine year walnut grove. Have been advised the walnut association does not recommend it.—Subscriber, Beaumont.

There are some people who find themselves ailing and rush at once to the pill box or the bottle of patent medicine—which will cure everything—and take a dose, often without rhyme or reason. There are even mothers who when the baby cries give it a dose of paregoric; sometimes with benefit, more often, perhaps, with the reverse. There are orchardists, or rather there were a few years ago, who think that if a tree is ailing the application of a few chemicals which contain certain elements will restore the harmony of nature and enable them to harvest big crops, but, unfortunately, this matter of living and doing things has more to do with thinking than with the application of a cure-all. Now what is the condition of the soil in question? Has it had sufficient green manure crops or stable manure to keep the ground in a workable condition, or have years of cultivation deprived it of its humus, or vegetable material? If not, the application of some form of vegetable matter would perhaps prove beneficial. On the other hand, there may be need of application of some immediately available fertilizer, and therein would be benefit if commercial fertilizers could be applied. There is no cure-all for trees; there is no royal road to conducting an orchard. Each grower must learn as to conditions of his soil, know what it needs, then apply it. Meanwhile it is reasonably safe for every owner of a California orchard to apply stable manure or plow under leguminous weeds or other cover crops. As to whether fertilizer intended for use in citrus orchards would be proper to apply to walnut orchards, we do not think there has been any determination so carefully made as to show any great difference in the needs of these trees. The safest proposition is for the grower to have sufficient of every element required by the crop.

Divorced Wife's Claim

An unsigned letter requesting information as to divorced wife's claim on property is not referred to our attorney for the two reasons that it is unsigned and that it is of such a nature that it should be taken to the attorney for a personal answer.

Resistant Windbreak

Will you please give me some advice on an evergreen windbreak. The Montery cypress and the Norway spruce will not do here on account of the hot dry atmosphere. We have plenty of water but the atmosphere is very hot and dry in the summer and cold in the winter. I understand the Arizona blue cypress and the libocedrus decurrens (California Incense Cedar) will do well but I have not seen them growing. I will have two rows of trees one on either side of a wide water ditch about ten or 12 feet apart. Will it be best to plant one row of a tall growing tree, say 100 to 125 feet and the other row a smaller kind, say 50 feet? Would some of the pines be better than cypress?—A. R. S., Lucerne Valley.

The most resistant to both heat and cold of any tall tree is Eucalyptus viminalis, the manna gum. It has passed through severe tests, both summer and winter, on the Mohave Desert. It would seem one row of tall trees should be planted on the side of the ditch where they will draw least food from the crops, if there is any difference; if not plant the lower growing tree on side from which the wind comes, as windbreaks planted in this way are most effective. The Arizona cypress would prove a good one, doubtless, for the shorter tree. It grows amid deep snows in winter and in hot dry air in summer.

Commercial Avocados

What is the best variety of avocado for the market? What month would be the best for budding?—G. B., Escondido.

The most experienced growers are nearly unanimous in declaring Fuerte the most profitable avocado we have at present. March is the best month to bud, but you may bud the trees over nearly all the year, or whenever the bark will slip free.

"Lice" on Cabbage

What can I do for lice on cabbage plants?—Subscriber.

Spray with tobacco extract, using the ordinary commercial extract diluted according to directions on the container, or one may prepare his own by steeping tobacco stumps or refuse tobacco. Perhaps equally as good results may be had by using tobacco dust diluted with, say, 50 per cent kaolin or hydrated lime, scattering freely over young cabbage plants.

Possibly Red Spider or Thrips

I have on my ranch near Pasadena a half dozen Eureka and Lisbon lemon trees and an equal number of limes. These trees are seven years old and all in a flourishing condition but every year just as the fruit begins to ripen it falls off, from no apparent cause as they are in my orange and grapefruit grove and get the same attention. I have two 20 year old lemons 100 yards distant but they do not fall off. Can you furnish any light on the subject?—Subscriber.

This may be caused by red spider or possibly thrips. In any case would recommend treatment for red spider. See article by Prof. Quayle on another page of this issue.

Cleaning Oil Tank for Water

Regarding cleaning iron oil or distillate tank so as to purify for holding drinking water, Mr. Neff writes that the first cleaning should be with gasoline. Give time for gasoline to evaporate then prepare as under directions for treating redwood tank in another query in this issue.

Redwood Wine Tank for Water

I am putting a redwood wine tank into use as a water tank to supply my house. We have scraped off a heavy coating of some crystal deposit from the inside and wish to know the best method of treatment to keep the water from tasting of wine. We are going to paraffine the inside and between the staves.—Subscriber, Winters.

The tank can be prepared so it will not flavor the water by giving it a heavy coating of asphaltum inside Clean the tank thoroughly and let it dry until there is no moisture on the inside of the staves. If the tank is six or more feet in diameter put it in the place it is to occupy before beginning the coating as the moving may crack the asphaltum. Then with hot asphaltum and a stiff brush put a heavy coat of about one-sixteenth inch thick completely over the inside. The asphaltum can be heated outside and away from the tank and passed to the painter by an assistant, or by using a small stove with a small fire inside the tank the asphaltum can be kept hot while using, being careful that it does not get hot enough to take fire Smaller tanks can be prepared and then put in the place they are to occupy. New redwood tanks will not stain the water if prepared in the same manner.—J. B. N.

Spray for Chicken House

Is there any kind of wet spray that one can apply to the interior of a chicken house with a power outfit for the purpose of eradicating lice?—Subscriber, Vacaville.

Lime-sulphur wash is perhaps one of the best commercial mixtures to use in poultry houses. It may be used even stronger than where intended for orchard trees, at this time of the year usually one to nine or ten. Use good pressure and spray into every crevice and crack. One may also use the

home made lime-sulphur solution. This consists of stone lime 50 pounds, sulphur 100 pounds, water to make 50 gallons. Use about 20 gallons of water to slake the lime, add sulphur while lime is slaking, hot water having been used. The remainder of the water, preferably hot, may be added later and when ready for use dilute still further, using about six gallons of water to one of stock solution. The kerosene emulsion or even straight distillate also make excellent poultry house sprays. Perhaps even better than this is either distillate or kerosene used with carbolic acid in the proportion of three parts either distillate or kerosene and one part carbolic acid. Then there is cresol or many others of the regular commercial disinfectants and insect destroyers. These commercial mixtures, also nicotine sulphate, may all be used in the spray pump and be given far more effective application than is possible with the brush.

Spraying Materials

What Sterling means to sliver, Orchard Brand means to spraying materials. It means reliability, good results, effectiveness. It has meant these for many years.

Orchard Brand spraying materials are manufactured in California to meet Pacific Coast conditions. They are the result of years of laboratory experiments by trained chemists, field tests by entomologists, and long use by practical fruit growers.

For every kind of fruit tree, citrus and deciduous, vines and plants, there is a spraying material made to yield results.

To inform you on the subject fully our entomologist, Mr. S. W. Foster, has written a booklet dealing authoritatively with tree and vine troubles and their prevention. Send for a free copy. At the same time write us about the condition of your trees or vines.

Other spray materials, for specific purposes, we recommend are:

Orchard Brand Dry powdered Arsenate of Lead.

Orchard Brand Arsenate of Lead, Standard paste.

Orchard Brand Atomic Sulphur (patented).

Orchard Brand Bordeaux Mixture paste.

Orchard Brand Powdered Bordeaux Mixture.

Orchard Brand Lime-Sulphur Solution.

Walnut Trees Wanted

A subscriber writes without giving address wishing to get best varieties of walnuts budded or grafted in black walnut stock. Wants sufficient for ten acres.

We fear it is too late to buy them for this season. Nurserymen are saying that every walnut tree available has been contracted for and most of them delivered. We doubt not any nurseryman advertising in the Cultivator will be glad to make contract for next year's delivery. It is not too soon to buy next year's stock.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Fence Upkeep

The line fence between the places of neighbor and myself is in poor condition and incapable of holding stock, as the wires are rusted and posts rotted. I have stock and my neighbor has not. Must I repair the fence at my expense to keep the stock out of my neighbor's field? He states he has no use for a fence and refuses to contribute anything for repairs. What proceedings are necessary to compel him to put up one-half of the repair of the fence?—Subscriber, San Luis Obispo.

The code provides that owners of adjoining property are mutually bound equally to maintain the boundaries and monuments between them, also the fences between them, unless one of them chooses to let his land lie without fencing, in which case, if he afterwards encloses it, he must refund to the other a just proportion of the value at the time of any division fence made by the latter. The fences being in place and it being required only to repair them, it would undoubtedly be true that you would be entitled to bring an ordinary action against your neighbor for one-half of the expense to which you have been placed in repairing the fence. In such proceeding you could doubtless attach and have execution against his real property or any judgment therein obtained.

Homestead

Home is in the name of both husband and wife. Some children are married and others at home. In case of death of either of us can the older ones lay claim to the home, or can it be arranged so that in such event the property would revert to the survivor or to be made to take care of the younger ones?—Subscriber.

Property being community property, in the case of the death of the wife the whole of the property would go to the husband without administration. In the case of the death of the husband, one-half of the property would go to the wife and one-half in equal shares to the children. This may be avoided in two ways: If the husband and wife file a joint homestead upon the property, uopn the death of either the survivor will take the whole of the property. Or each can make a will devising all their interest in the property to the other. The filing of the declaration of homestead is, however, recommended as being the least expensive and most effective.

90 Years of Knowing How

THAT'S your assurance of correct weight when you buy a FAIRBANKS Scale.

You can't afford to *guess* the weight of your live stock and produce. You must *know* exactly how much you have to get highest returns. A poor scale may mislead you. You should be *sure* you are getting accurate weight.

Modern farm efficiency demands nothing less than FAIRBANKS Scales to assure authentic weight records with which to protect your profits.

"If it's weighed on a FAIRBANKS, there's no argument"

Fairbanks, Morse & Co. CHICAGO

What the OilPull Trademark Means to You

The OilPull trademark identifies the greatest tractor value in the world.

It is a guarantee of proved long life—lowest cost of operation—great reserve power.

It distinguishes the only guaranteed oil burning, oil cooled tractor built.

It is the trademark to which over 15,000 owners all over the world point with pride.

Built in four sizes—12-20, 16-30, 20-40 and 30-60 H. P.

When Writing Advertisers, Mention the Cultivator.

The Cattle Situation

By A. L. Spellmeyer

CALIFORNIA has had three dry years and 1920 ushered in the fourth drier and colder than any year since 1876-77 for the stockmen. Cattlemen have looked for rains and an early season, and great expense has been put upon them. Sheep men are lambing on old feed with consequent hardships and loss. But there is still time to realize returns from stock to equalize expense and in some cases to pay a profit, providing the rains come followed by warm weather.

Heard states that 22 per cent of the present living cost is for cattle products; Jastro that there never was a time in his 50 years of experience in cattle that it was harder to stay in the business; Fred Colter, that he is certain cows are both scarce and will be high—and believing it purchased a thousand he will need on the Arizona ranches next spring and is holding them on the Rancho Verde near Victorville. Bob Easton says that both New Mexico and Texas are short and advised me to hang on to a bunch up north and feed them with a spoon if necessary to keep them alive.

A survey of conditions in foreign countries, from figures available, shows no prospect of relief, as they are short in producing stock in most countries, and both the Argentine and Australia are finding markets for present production. Only shortage in this country and consequent higher prices would cause importation, but it is probable unless our cattle production is stimulated.

Actual shortage has been a fact in this country but the sacrifice of breeding stock, owing to drouths and high beef prices, has temporarily deferred its effect.

Figures for California show that this state is credited with 1,650,000 beef type cattle and 561,000 dairy cattle valued at over $123,000,000. In this state swine are valued at $18,000,000, sheep at $35,000,000 and horses at $8,000,000. When one figures that the $184,000,000 worth of livestock in this state requires an investment of many times the value of livestock, it is apparent a tidy little sum is involved in the livestock business of California.

January 1, 1919 showed a decrease of ordinary cattle in California of almost 100,000 head, but this is small as compared to facts and what January 1, 1920 figures will probably show. An apparent decrease during the time of close assessment now prevalent is more serious than it appears, and many stockmen who have covered the state thoroughly believe that California is over one-third short on beef type cattle, and facing an increased demand daily from increasing population.

Less than half the available number of cattle are being fed in districts adjacent to Southern California. Los Angeles is killing more than usual, estimated at 14,000 monthly with an approximate 40,000 to draw upon between now and the time spring beef arrives.

In 1907-8 cattle prices started up and possible shortage was realized. In 1900 this country had 89 cattle of all kinds to the 100 of human population. In 1919 this country had 42 cattle to the 100 people.

The following figures are rather startling: Beef type cattle, 1907, 51,566,000; 1918-19, 44,399,000. Cattle slaughtered, government inspection, 1907, 7,621,717; 1918-19, 10,938,287. Calves slaughtered, government inspection, 1907, 1,763,574; 1918-19, 3,323,077. Market receipts, 1907, 5,590,710; 1918-19, 12.936,068. Live cattle exports, 1907, 423,051; 1918-19, 18,213. Live cattle imports, 1907, 32,402; 1918-19, 293,719. Beef, fresh, pickled and canned in 1918, approximate exports equivalent merely to 1,000,000 steers, or 522,000,000 pounds.

If this country did not materially increase cattle numbers since 1907 when slaughter was but 9,000,000 head of cattle and calves how can it stand a slaughter of 14.000,000 head a year? By no means all the cattle are killed under government inspection, and I have seen an estimated slaughtering record giving the total number of cattle killed as 17,000,000 head.

It is impossible for 69,000,000 cattle, beef and dairy, 70,000,000 cattle or 80,000,000 cattle, to maintain loss, and increase with a slaughter of 15 to 17,000,000 yearly of production. Would any cowman expect a herd of 68 cattle consisting of one bull, 20 cows, 16 yearlings, 14 two year old, eight threes steers and nine big calves, to permit a slaughter of 15 to 17 head yearly and maintain numbers against loss and increase. It's a physical impossibility.

The cost of living is the important question today, and 22 per cent to 33 per cent of it is directly connected with meat and livestock production. Production of cattle is hardly profitable today at a time when meat is high to consumers. More production is generally admitted to be the remedy. Cattle production could have stood marketing abuse but it cannot stand low prices for range production, expense considered, drouth and loss combined together with difficulties in financing.

The time has arrived when cattle production must be assisted as it seems we are as a country falling behind, especially as compared to population increase.

CALIFORNIA LAWS RELATING TO ANIMAL INDUSTRY

The division of animal industry recently compiled laws prescribing jurisdiction of the division, together with many miscellaneous acts indirectly related to its activities and enforced by other state officers, such as those relating to cruelty to animals, herding and grazing of livestock, fencing, pasture and trespass laws, commercial feeding stuffs, etc. This is the first time that such a compilation has been made and it is believed that this will prove a convenient manual for all persons who are interested in legal matters pertaining to animal industry. It will obviate the necessity of having numerous individual acts and laws in one's possession which might become mislaid or lost.

Copies of this manual may be procured by addressing State Department of Agriculture, Division of Animal Industry, Sacramento.

If it isn't Germain's—it isn't the genuine PROVEN strain

We introduced HAIRY PERUVIAN ALFALFA to the California farmer—and we naturally feel responsible for its success. Only the genuine, *proven* strain is sold under the name "Germain."

Germain's PROVEN Hairy Peruvian Alfalfa seed is *recleaned* to eliminate waste, and is specially treated to insure quick and easy germination.

Sold only in sealed and stenciled bags. Every Alfalfa grower should read our free folders on Germain's PROVEN Hairy Peruvian Alfalfa.

Better Sires---Improved Female Stock

THAT the use of pure bred sires is usually a forerunner to ownership of well bred livestock in the various classes and breeds is shown by data on breeding just made public by the bureau of animal industry, United States department of agriculture. The facts and figures compiled are based on records of the "Better Sires—Better Stock" campaign, which at the close of 1919 had been in progress just three months. A greater quantity of data will be needed before conclusive deductions may be made, but the following facts are considered of unusual interest to livestock owners:

Ownership of Pure Bred Females Follows Better Sires

The use of pure bred sires appears to lead automatically to the ownership of a considerable quantity of pure bred female stock.

The use of pure bred sires apparently results also in the culling out of scrub females, judging from the small proportion of scrub females to grade, cross bred and pure bred female animals owned by pure bred sire users.

Of all female stock owned by persons enrolled in the better sires campaign at the end of the year, 71 per cent were pure bred, 26 per cent were grades and cross breds, and three per cent were scrubs.

The scrub females are believed to be the remnants of former inferior stock before pure bred sires were used, since pure bred sires lead automatically to either pure bred, cross bred, or grade offspring, depending on the blood lines of the females used.

Low Percentages of Scrub Females

The percentage of pure bred females found in herds and flocks owned by pure bred sire users was noticeably similar for the various classes of animals. In cattle the per cent of pure bred females was 63.5, in swine 64, in sheep 63.

The per cent of scrub females in the same classes was: Cattle 3.6, swine 2.0, sheep 6.4.

Poultry figures showed the smallest per cent of scrub females in flocks headed by sires of pure breeding, the figure being 1.8.

Similar figures for horses, asses and goats are not presented, as the enrollment of these animals is not considered sufficiently large at this time. Those classes, however, were included in the totals.

Comments accompanying blanks of enrollment indicated that many livestock owners had used pure bred sires for a considerable period, which materially reduced the percentage of scrubs. This is likely to be true of a good many who enroll early in the campaign, but is evidence pointing strongly to the influence of pure bred sires on improvement in quality of herds and flocks.

Shows Results of State Work for Better Bulls

The drive which many states have been waging against scrub bulls was reflected in the enrollment figures. More pure bred bulls were enrolled than any other class of livestock, except poultry.

At the end of December there were enrolled in the "Better Sires—Better Stock" campaign 6,200 animals, and in addition 8,949 poultry.

Facts Obtained With Special Care

Knowledge about the breeding of livestock in the "Better Sires—Better Stock" campaign is obtained with special care. First, the owner of the stock lists his animals kept for breeding on the enrollment blank in accordance with the official definitions for the various classes of animals with respect to their parentage. As the better sires slogan indicates, all males must be pure bred and of good quality.

Female stock may be of any breeding and spaces are provided for the listing of pure bred, grade, cross bred and scrub females. Then the classification is approved by the county agent in the county where the livestock owner lives. In the relatively few cases where there is no county agent, the written indorsement of the blank by two experienced and disinterested livestock owners is required.

Every person agreeing in writing, on the blank furnished, to use only pure bred sires in his breeding operations receives an emblem of recognition issued cooperatively by the United States department of agriculture and the state in which he lives. So-called "red tape" has been reduced to a minimum and the emblems have been issued in most cases the day the blanks were received.

Female Stock Need Not Be Pure Bred

Though pointing out the foregoing observations—and especially the tendency for pure bred sire owners to acquire pure bred females—the department of agriculture does not urge pure bred female stock on the average farm. Whether pure bred females should be kept is a matter of individual judgment, depending on circumstances which the livestock owner is best able to know. The successful breeding of pure bred live stock as a business calls for close attention and considerable experience, both in production and marketing. By contrast, the purpose of the better sires movement is to raise the average quality of all livestock in the United States.

Regulations for Interstate Shipment

Some complaints have been received by the division of animal industry from other state officials relative to mistakes that have at times been made by local veterinarians authorized by the state department to make inspections of interstate shipments of cattle. The division has recently made the following summary of regulation seven, relating to the application of the tuberculin test for cattle for interstate shipment. It is urged that the greatest care be observed by veterinarians doing this work, both in making out reports and carrying out the details of the test. There can be no doubt but that if this work is honestly and conscientiously performed it will result in a large stride toward eradicating tuberculosis from the state.

No tuberculous cattle may be shipped interstate except:

I. For immediate slaughter and under following conditions:
1. Consigned to public stockyards under B. A. I. inspection.
2. Cattle to be marked by
   a. Punching "T" in left ear, or branding "T" on the jaw or tattooing "T" inside of left ear.
   b. Attaching metal ear tag (B. A. I. Reactor. Serial No. —).
3. Certificate by B. A. I. or state inspector, stating:
   a. Cattle are reactors.
   b. Permission granted.
   c. Purpose—immediate slaughter.
4. Not to be in same car with healthy cattle or hogs unless these are for immediate slaughter.
5. Transportation company to indicate on conductor's manifests, wayhills, etc.,
   a. "Tuberculous cattle.'
   b. Car to be immediately disinfected after use under B. A. I. supervision.

II. Reacting pure bred cattle not for immediate slaughter may be
1. Returned to original owner, to point of origin, and within four months of date of original shipment.
2. Not shipped to any state, territory or District of Columbia where no provision for quarantine until death or slaughter.

Note—(All states having adopted the "accredited herd" plan required to have this provision.)
3. Marked as in I-2 above.
4. Certificate as in I-3 above (Original and retest tuberculin test charts to be presented.)
5. Not with other cattle, etc., as in I-4 above.
6. Transportation company to indicate as in I-5 above.
7. Not again reshipped interstate

WHY DE LAVAL Cream Separators Are Best

There's a reason for everything, and surely one for the superiority of DE LAVAL separators.

The DE LAVAL was the first continuous discharge centrifugal cream separator. Invented in 1878, it has led ever since. The great DE LAVAL shops in both America and Europe are devoted solely to the production of centrifugal separating and clarifying machines.

Large staffs of DE LAVAL experimental and developmental engineers, in both America and Europe, constantly devote their time, skill and knowledge to the further improvement of the DE LAVAL Cream Separator.

Every single step of cream separator advancement, for forty years, has been DE LAVAL conceived or developed.

On the other hand, practically every feature of construction ever used in any other cream separator has been one that run-out DE LAVAL patents left free. Such features have then always been out of date in the later improved DE LAVAL construction, and most of them were never quite good enough to have been actually used in DE LAVAL construction at all.

It might aptly be said that DE LAVAL has forgotten more about cream separators than its imitators and would-be competitors ever knew.

And then it must be remembered that the cream separator, with its necessarily high revolving speed, great capacity, ease of operation, simplicity and durability, is a very difficult machine to build right, and can only be built right with long experience, highly skilled employes and a vast amount of special equipment. Hence there is nothing strange about the fact of DE LAVAL Cream Separator superiority.

"FEEDFINE" FEEDS

are scientifically compounded in proper proportions for dairy and all livestock feeding, of the following ingredients with the most economical results always in view.

YEAST	A concentrate high in PROTEIN and FAT content, sterilized and predigested.
CANE MOLASSES	The richest of feeds in carbohydrates—produces increased appetite on account of its palatableness. Its consumption results in increased energy and it is the best tonic known for animals.
ALFALFA MEAL	Gives body to the ration and supplies the mineral matter which is absolutely essential to all animals.

The greatest known combination for health, strength and productiveness.

California Cultivator Costs $1 per Year

When Feed Is Scarce and High

The Owner of Whitefaces Smiles

Not because of scarcity and high prices, but because he knows that under these handicaps he has the best cattle possible for him to own.

Unsurpassed by any breed under normal feed and range conditions, HEREFORD CATTLE stand out in a class by themselves, during the periods of drought, scant range, or winter hardship, a fact that has been demonstrated year after year on some of the world's greatest ranges, as well as on thousands of smaller holdings.

Since their invasion of the west, HEREFORDS have increased steadily and rapidly in popular esteem, as progressive cattlemen have had opportunity to observe their actual performance under various conditions, and through sheer merit the excellence of the breed has created a demand for pure bred registered breeding HEREFORDS far in excess of the available supply.

One of the good opportunities to purchase registered pure bred HEREFORDS will be made possible by Pacific Coast breeders at

University Farm, Davis, Cal.
Wednesday, February 25, 1920

when they will offer an unusually well bred lot of cows, heifers, and bulls.

THE FEMALES will include drafts from many of the most substantial western herds, and a large number will be safe in calf to the high class sires now in service, presenting to the beginning breeder an opportunity for wise selection of foundation females.

THE BULLS will be an especial feature of the sale, as the breeders will make a real effort in this offering to make available to owners of range herds a class of bulls that will breed HEREFORD quality into their herds in a marked degree.

Write for catalog of sale. Detailed announcements will appear in later issues.

The Highest Priced SIRE and SON

KING KORNDYKE PONTIAC 20th
and HIS SON
KARLRAY PONTIAC TOLA

King Korndyke Pontiac 20th, our junior herd sire, at $6500, is the highest priced Holstein bull ever sold at public sale in California.
Karlray Pontiac Tola, a three months old son of King Korndyke Pontiac 20th, and the great heifer K. P. Tola Joe, has been sold by Gotshall and Magruder, Ripon, to A. B. Spooner, San Luis Obispo, at a price never exceeded in California for a bull calf at private sale.
In these instances price is a true measure of quality.
Why not put a son of this sire at the head of your herd?

Holstein Opportunity

50 Registered Holstein Cows and Heifers

For Sale at Private Treaty

The females in offer are well bred, nicely marked, of good individuality and all have A. R. O. records. All are fresh or springing and are bred to a 32-ib. bull. They must be moved quickly and are priced accordingly. This is a real opportunity to be taken advantage of quickly. Also offer a few high producing grade Holsteins.

For particulars, address

V. L. Heath Lodi, Cal.

except for immediate slaughter as in I.

All cattle six months old or over, if not for immediate slaughter, must be tuberculin tested except the following exemptions:

1. Cows and bulls for "feeding only"—on affidavit of owner.
2. To state where quarantined until death or slaughter. (See Note II-2 above.)
3. Heifers (under 3 years—not yet calved) "for feeding" upon certification by owner.
4. Accredited herd cattle.
5. Steers and strictly range cattle, as follows:
   a. Moving entire herd—"for feeding"—exempt.
   b. Moving only a few cows or bulls—"for breeding"—must be tested.
6. When consigned to public stockyards for slaughter.

WHY DOES THE DAIRY MAN RAISE PRICES?

(Continued from Cover Page)

find that the names used as complainants against the dairymen's association in the proposed litigation authorized by Attorney General Webb are mere dummies, and the men holding the sack, who are behind this persecution of the dairymen's association are the private creamery interests whose exploitation of the dairymen is now challenged by the cooperative associations. Such associations are the only protection the individual dairyman, as a rule, has against ruin and the only hope he has for the future.

The dairy associations have done more to keep untold numbers of dairymen from quitting the business, thereby reducing milk supplies and increasing prices to consumers, than any other agency ever created in California.

No one can fairly and intelligently criticize the prices charged by the dairymens' associations for their milk, unless he knows the average cost of producing a gallon of milk. Only with that knowledge can it be determined whether the dairymen's associations are exploiters and profiteers. I challenge any of the glib tongued men and women, who in order to gain newspaper notoriety, have been giving wholesale mis-information and recklessly condemning the dairymen's association prices, to give the cost of producing a gallon of milk that will stand a fair analysis.

Unless these loose tongued critics are in a position to furnish authentic costs of production, their criticisms are worthless and they make of themselves mere slanderers of a group of the hardest working, most industrious, least paid, and most valuable farm producers in the entire commonwealth.

The question as to whether the dairymen's associations are exploiters was thoroughly gone into by a joint committee of both houses of the legislature at its last session. This committee gave it as a result of its investigations that the cost of feed, labor and milk production has increased at a slightly greater ratio than the price of milk, and completely vindicated the producers' organizations.

Whatever advances in price have since become unavoidable, can be shown to any fair minded committee as being simply enough to cover the continued increased cost of production.

GATEWOOD SALE ESTABLISHES NEW RECORD

In the dispersal sale of Poland Chinas held by Chas. Gatewood at Fresno, January 26, a new state and Western record was established when Alfred Buckland & Son of Fersno, together with Z. M. Dickey of Dinuba, paid $5,250 for Giant Bob. This price is the highest ever paid west of the Rocky Mountains for a boar of any breed. Giant Bob was sired by Caldwell's Big Bob, grand champion at the 1918 National Swine Show. His dam was Giantess 2d, a daughter of Big Bone A Wonder and Long Giantess. Giant Bob was grand champion at the 1919 California state fair. The general average of the entire sale was $225. Full details will be found in next week's Cultivator.

THE MUSIC THAT HAS CHARMS

He: Most girls, I have found, don't appreciate real music.

Second He: Why do you say that?

He: Well, you may pick beautiful strains on a mandolin for an hour, and she won't even look out of the window, but just one honk of a horn and—out she comes!—London Blighty.

SANTA ANITA RANCHO

Anoakia Breeding Farm
Arabian-Thoroughbreds

Out of our choicest thoroughbred mares and sired by our famous imported stallion Ibn Mahruss we are offering some splendid two year olds. Also some especially desirable young saddle stock sired by Ibn Mahruss, world renowned Arabian desert stallion and Don Castano, five gaited saddle stallion, winner in many prominent shows.

Mammoth Jacks

We have for sale a number of two and three year old jacks, big, growthy fellows of exceptional breeding and quality.

Poland China and Berkshire Boars

Sired by the World's Fair winners, BANKER'S BOY and KINTYRE LAIRD, and by others of our herd boars of equal breeding.

Holsteins Lead as Dual Purpose Cattle

The Michigan, Iowa and Nebraska State Experiment Stations report that in their competitive tests Holsteins made a larger gain per steer at a less cost per pound of either roughage or grain than any of the other breeds. As voluminous and profitable milk producers, and as valuable beef animals when their milking days are over, pure bred Holsteins are firmly established as the world's leading dual purpose cows.

Final Awards in the Sacramento-Yolo Cow Testing Association Competition

A. E. Greene, president of the Sacramento-Yolo Cow Testing Association, has announced the following results and awards for the competition conducted during the year ending December 31:

Class A, highest herd of 1 to 20 cows—First prize, cup by Sacramento Clearing House, J. H. Sawyer, Galt, 368.8 pounds butter fat; second prize, merchandise by Patterson Supply Company, J. N. Dimmick, Galt, 308.7 pounds butter fat.

Class B, highest herd of 21 to 50 cows — First prize, cup by Clearing House, A. E. Greene, Hood, 391.9 pounds butter fat; second prize, merchandise by Newbert Implement Company, Adolph Kloss, Franklin, 288.2 pounds butter fat.

Class C, highest herd of more than 50 cows—First prize, cup by Clearing House, John S. Watson, Dixon, 300.2 pounds butter fat; second prize, merchandise by J. N. Blair Company, E. E. Bunnell, Hood, 297.0 pounds butter fat.

Class D, highest herd in each of the above classes headed by grade sire—Pure bred bull by Bonita Stock Farm, J. N. Dimmick, Galt; pure bred bull by F. W. Kiesel, Adolph Kloss, Franklin; pure bred bull by A. W. Morris & Sons, John Herzog Estate, Courtland.

Class E, highest cow under five years (yearly record)—First prize, cup by Clearing House, A. E. Greene, Hood, age three years, 482.2; second prize, cup by Douglas Boswell, A. E. Greene, Hood, age four years, 472.3.

Class F, highest cow over five years—First prize, cup by Clearing House, F. W. Kiesel, No. 5, 673.1; second prize, cup by Sperry Flour Company, A. E. Greene, No. 1, 598.2.

Class G, highest monthly group of five cows in one herd—(Cows winning this once are barred from further competition in this class.)

January, cup by Geo. P. Robinson, A. E. Greene, Hood, cows 16, 76, 66, 75, 11—2.740 fat.

February, cup by Emigh Winchell Hardware Company, A. E. Greene, Hood, cows 1, 45, 4, 77, 38—2.190 fat.

March, cup by Ord L. Leachman, S. S. Hinsdale Estate, Clarksburg, cows 424, 421, 409, 395, 305—1.970 fat.

April, cup by Dr. H. W. C. Lichtenwalter, Hollister Estate, Courtland, cows 390, 227, 325, 315, 380—2.040 fat.

May, cup by Emigh Winchell Hardware Company, E. E. Bunnell, Hood, cows 70, 39, 34, 104-A, 16—1.992 fat.

June, cup by Ord L. Leachman, J. S. Watson, Dixon, cows 206, 214, 514, 431, 504—1.800 fat.

July, cup by News Publishing Company, John Herzog Estate, Courtland, cows 16, 93, 32, 35, 5—1.860 fat.

August, cup by Emigh Winchell Hardware Company, John Herzog Estate, Courtland, cows 271, 316, 393, 392, 249—1.620 fat.

September, cup by Ord L. Leachman, Matt Smith, Franklin, cows 2, 4, 3, 1, 5—1.670 fat.

October, cup by Dr. H. W. C. Lichtenwalter, C. L. Etling, Elk Grove, cows 2, 18, 16, 19, 5—1.970 fat.

November, cup by Emigh Winchell Hardware Company, A. E. Greene, Hood, cows 39, 8, 9, 78, 74—1.946 fat.

December, cup by Ord L. Leachman, Brownell & Marshall, Woodland, cows 167, 193, 166, 182, 174—2.126 fat.

Class H, highest yearly average of grade Jersey herd—Pure bred Jersey bull by Judge Peter J. Shields, J. H. Sawyer, Galt, 368.8 pounds butter fat.

Class I, free-for-all for herd showing greatest improvement during last six months of 1919 over the last six months of 1918 — First prize, cup by California Cultivator, J. N. Dimmick, Galt, 59 per cent, or 68.1 pounds butter fat increase; second prize, boar by Sandercock Land Company, G. W. Foulks & Son, Elk Grove, 33 per cent, or 34.1 pounds butter fat increase.

Class J, free-for-all best herd—Cup by Sacramento Bee (for perpetual ownership must be won three times), A. E. Greene, Hood, 391.9 pounds butter fat.

McCune Sale of Poland Chinas

H. D. McCune held his first public sale of Poland Chinas in Hanford, January 24. The first 20 animals sold for the fine average of $211.50 and the 48 head, including a number of fall pigs and open gilts, sold for $6,072.

The top of the sale was an open gilt by Surprise Prospect and out of Edith Rose, W. D. Trewhitt, Hanford, purchasing her for $610. Her littermate, a boar, sold to T. G. Woodworth, Stratford, for $400. One of the interesting features of the sale was the manner in which her pigs sold, E. S. Almgren, Reedley, paying $155 for a September sow pig by King's Massive Orange. McCune's senior herd boar and a litter sister went to W. L. Haag and Son, Hanford, for $72.50. B. S. Moore, teacher of agriculture in the Hanford high school, secured a sow pig by the Californian for $72.50.

That the offering was attractive was evidenced by the support accorded it by both the breeders and the farmers, especially those living in Mr. McCune's neighborhood. The animals were in good condition, well grown and in the opinion of a number of breeders present a better lot of animals had never been sold in the state. Mr. McCune is well pleased with the result of his first sale. Geo. W. Bell of Tulare was the auctioneer and was assisted in the ring by Cy Clark, Modesto, and Dolash Bros., Corcoran. Following is detailed report of animals selling for $100 or more:

1, L. M. Essick, Stratford, $245.
2, J. W. Creelman, Lemoore, $170.
3, M. Lovelace, Lemoore, $145.
4, J. W. Creelman, $205.
5, Wm. Bernstein, Hanford, $230.
6, W. L. Haag & Son, Hanford, $260.
7, W. D. Trewhitt, Hanford, $150.
9, J. M. Bernstein, Hanford, $185.
10, E. G. Myers, Lemoore, $175.
11, L. M. Essick, $160.
12, Wm. Bernstein, $150.
13, T. G. Woodworth, Stratford, $155.
14, A. J. Elliott, Tulare, $280.
16, A. R. Doctor, Van Nuys, $205.
17, R. F. Guerin, Visalia, $175.
18, T. G. Woodworth, $400.
19, W. D. Trewhitt, $610.
20, Wm. Bernstein, $100.
21, H. I. Marsh, Modesto, $125.
22, A. B. Vroom, McFarland, $105.
24, G. O. Pratt, Lemoore, $130.
26, J. M. Bernstein, $120.
39, M. Lovelace, $100.
49, Sow pig, E. S. Almgren, Reedley, $155.

WESTERN BERKSHIRE CONGRESS MEETING AND SALE

Women admirers of Berkshires will have an opportunity to prove what they know about the points of this breed of swine on Tuesday, February 17, when the Western Berkshire Congress opens its annual meeting at the university farm at Davis. In addition to the women's contest trophies will be given the best student judges of Berkshires. These contests will occupy the morning of the first day of the annual meeting and sale, the afternoon to be occupied with the business session and election of officers, while in the evening the breeders will hold forth in the banquet hall.

The sale this year, in addition to featuring entries from four states, will also be somewhat of a prize contest, as each breeder has been obliged to put up an entry fee which goes into a prize fund from which cash awards will be made for sow, gilt and boar classes.

The consignors to the sale, which will be held on the afternoon of Wednesday, the 18th, are: A. B. Humphrey, Escalon; Anchorage Farm, Orland; Castleview Ranch, J. Francis O'Connor, Santa Rosa; W. F. Sandercock, Sacramento; Hugh Nesbit, Chimacum, Washington; Frank B. Anderson, Sacramento; Silver Glenn Stock Farm, James C. Bonner, Silverton, Oregon; Italian Vineyard Company, Guasti; H. C. Muddox & Son, Sacramento; R. C. Gruhlke, Dixon; George M. York, Modesto; Kounias Registered Stock Farm, Modesto; Calac Orchards, George P. Upham, Martinez; C. P. Warnick & Sons, Pleasant Grove, Utah; R. J. Merrill & Son, Morgan Hill, and E. J. Ferguson, Santa Rosa. Ord L. Leachman will cry the sale.

McCune Thanks You

To the breeders and farmers who attended my sale I express my thanks. It was you who made this, my first sale, such a great success. Again, I thank you.

H. D. McCUNE, LEMOORE, CAL.

Better service is assured by the advertiser if when writing you mention the California Cultivator.

MODERN HOGS FOR MODERN FARMERS

There might have been a time when California farmers could afford to raise hogs that returned little or no profit for the feed they consumed—but that time is past. Today the modern, progressive, wide awake money making farmer finds that only through modern equipment and up to date methods can he expect to make profitable returns on his investment—he is the chap who knows that the old slipshod methods of the early days don't go now. He is the man that figures close and cuts expenses at every turn. He is the man who knows that the only kind of livestock that he can afford to raise is the better kind and he is the man who knows that the only kind of hogs that he can afford to raise are the big, quick growing, early maturing, easy feeding and economical modern kind—the kind to sell in the sale of the

Fresno County Poland China Breeders' Association
Fresno Fair Grounds, Wednesday, Feb. 11th

This sale is authorized and sponsored by the members of the above association and the offering has been selected from the best herds of the county (and there are some mighty good herds in Fresno County).

Forty Outstanding Bred Sows and Gilts

that are right individually and sired by such boars as Rossmead's Big Bob by Caldwell's Big Bob; Favorite's Best, the 965 lb. boar shown at the Fresno Fair; Fresno Sampson, Fred Gatewood's great senior yearling; Giant Bob, the 1919 Grand Champion; President; Young Jumbo; King's Big Bone Leader, the 1918 Grand Champion; Model Fellow, one of the greatest breeding boars ever used in California, and Big Jumbo Timm.

The offering will sell carrying the service of many of the outstanding boars of the breed owned in this state.

And Remember This---

the kind that we are selling are the kind that the modern farmer must raise if he expects a profit. Every ranch in California, no matter how small or how large, should make a start with better hogs and we believe that the best hog for all conditions is the POLAND CHINA. If you don't believe it attend our sale and be convinced.

OUT FOR THE MONEY

Down at Bakersfield there is a young Poland China breeder, Ear Ahmann, who seems to have the right idea. He knows when he has got the right kind of a brood sow and he does not intend to let anyone get her unless he pays the price. Last summer he bought a bred gilt from H. I. Marsh, Modesto, and after she farrowed he wrote to Mr. Marsh:

"Thanks to the mother of Big Lady F for her large litters, because my gilt got into that style of big litters too. Well, last Saturday morning my gilt had 11 pigs and still has eight left. She had eight sows and three boars and has five gilts and three boars. Some nice litter, I claim. They averaged two and five-eighths pounds at birth, the largest, a boar, weighing three and one-fourth pounds, the smallest, a sow pig, weighing two and one-fourth. My sow is very gentle and careful. She only laid on one, and two died shortly after birth. Now, Mr. Marsh, you sure are going to have to pay for that sow, because I sure do like her and her litters. How much do you offer to give me for first choice pig at ten weeks of age? I have the record litter of the herd in the club. I remain, the record buster."

BILL OF SALE

J. B. Newsom of the Cattle Protection Board calls attention to the fact that the law now requires, when cattle are sold or transferred, that a bill of sale be given describing the animal, the marks and brands, the date of sale and the place of sale. These bills of sale must be signed by the seller and witnessed by two freeholders and are the only legal evidence of ownership of cattle purchased. It must be shown to inspectors appointed by the division of animal industry of the state department of agriculture at the time the cattle are offered for shipment at the railroad loading chutes or at slaughtering establishments prior to slaughter. Inspectors will not permit cattle to be shipped or slaughtered unless evidence of ownership is established by virtue of bills of sale. Sample forms of a bill of sale will be furnished by applying to Cattle Protection Board, Sacramento. Additional forms can be secured by having some printed by any printing establishment at a small cost.

RABIES DISCOVERED NEAR STOCKTON

A peculiar disease was recently reported by a rancher among his dairy cows. The symptoms described appeared to resemble those of forage poisoning. It was noted, however, that the cows showed decided tendencies to be vicious and would attack other animals and even men when they were approached, although those tendencies were not as marked as is usual in cases of furious rabies. It was reported that a mad dog had been at large in this district some months previous, which had subsequently been killed. Examination of the brain by the state hygienic laboratory showed it to be a positive case of rabies. The brain of one of the cows was submitted to the same laboratory and Negri bodies found.

BOYCOTT MARGARINE DEALERS

What is going to become of our dairy industry in California? There is no money in butter short of 70 cents per pound now. The butter substitutes are coming thick and fast onto the market and are being sold at about half the price of butter. I would suggest that each farm center buy its groceries from a firm that does not handle butter substitutes. It's a common thing for a merchant to tell his customer that he has some very good butter substitute. I say let us discard that kind of a merchant and trade with the one who will handle the dairy product and work for the interest of his customers. The oleomargarine manufacturer surely does not buy very much from the merchants, at least in the outlying towns.

Yours for success to the Cultivator,
S. D. Pruden.

We are not very strong on the boycott, but in consideration of the fact that grocers of San Francisco have hung out their shingle announcing "No potatoes being sold. Boycott potatoes," and various other boycotts have been declared on farm products, perhaps that is the only possible thing for the farmer to do.

The next sale of Duroc-Jerseys to be held by the Tulare Duroc-Jersey breeders will be in Tulare, February 12. Fifty bred sows and gilts will be offered and in addition to the animals from the herds of the Tulare breeders, consignment from Greenwood Farms, Mossdale Farm and Conejo Ranch will be included. Previous sales having been successful, strong effort is being made to uphold the standard already set, and for this reason care has been exercised in the selections for this sale. Representative blood lines will predominate in the animals to be sold as well as in the boars to which they will be bred. The Tulare breeders believe they are affording the young breeder an opportunity for securing foundation animals and the farmer for adding a profitable animal to his farm.

Z. M. Dickey, Dinuba, is establishing on his ranch of some 900 acres the Sequoia herd of big type Poland Chinas. For years Mr. Dickey has been a producer of pork but recent experiments convinced him that pure breds paid better than grades. He has recently secured from Thos. F. Walker and Son, Alexandria, Nebraska, as a boar to head his herd, The Sequoian, by Blue Valley Big Bone, dam Miss Big Bone Bob. He states that in the future his livestock operations will be confined to breeding big type Poland Chinas and that all the animals now on the ranch that do not come up to the big type standard will be disposed of as rapidly as possible.

A. Buckland and Son, Fresno, have recently purchased from J. F. Lehman, Lodi, the grand champion Poland China boar at the San Francisco Livestock Show, Golden West King. Mr. Buckland in speaking of his purchase stated that for some time he had been trying to secure a young boar and recently secured one in the East. He returned him as he was inferior to a number he knew he could purchase here in California. He also states that he can purchase better animals at a reasonable price right here at home and is of the opinion that they will attain greater size and have a larger bone in a given time than those bred and raised in the East.

Thos. Caesar and Son, Poland China breeders, Reedley, have recently secured from W. H. Charters, Butler, Missouri, a young boar by King's Buster by Giant Buster and has for his dam Long Giantess 2nd.

Bred Sow Sale, March 13

ASK THE MAN

WHO HAS SEEN

Golden West King Grand Champion Poland China Boar at the San Francisco Livestock Show

Blue Valley King by King Big Bone and the Sire of Typical Poland Chinas

about these two Poland China boars. We are willing to accept his judgment. When you want the profitable, big type Poland China it will pay you as it has others to get in touch with us.

A. Buckland & Son, R.F.D., Fresno, Cal.

DON'T BE TOO LATE

Just a few of the prize winning Poland Chinas, that have been the sensations at this year's shows, remain unsold. I am not pricing them unreasonably and much less than you would pay in the east for animals not so good. Write me today what you want and I will send you full particuars.

J. F. LEHMAN LODI, CAL.

Smooth King

is a real Poland China boar—his name signifies just what he is, smooth—and a king. When I can't breed, raise and sell the right kind of Poland Chinas I will quit the business. This is one reason for my success. Pleased customers keep me in. Write me when you want good Poland Chinas.

Eugene Miner Lodi, Cal.

The Practical Test

of any breeder is satisfied customers. Recent sales to old customers indicate to me that my practical herd of big type Poland China sows headed by Forrestview Bob, a son of Caldwell's Big Bob, are producing the kind that satisfy. I will be pleased to satisfy you. Write me.

J. H. Cook Paradise, Cal.

The management of the Weimar Sanatorium, Weimar, Placer County, has purchased a herd of 12 registered Holsteins as a foundation for a large herd that is to be developed at that institution.

Butte City Ranch, Butte City, reports having sold a foundation flock of registered Shropshire sheep to Col. D. A. Shelloe of Glenn.

A. W. Morris & Sons, Woodland, have announced the sale of their home ranch consisting of 1,280 acres to the Conaway Ranch Company, for a consideration of $204,000. Possession will not be given until the Morrises have completed improvements on their new ranch northeast of Woodland.

Dora Pontiac Segis, the first daughter of King Pontiac Netherland Segis 3d to freshen with second calf, has completed an official record of 24.30 pounds butter from 496.7 pounds milk in seven days. She and her sire and dam are all owned by Stalder Bros. at their Rosamaines Rancho, Riverside, where there is a choice group of heifers by the same sire coming on. King Pontiac Netherland Segis 3d is by a proven son of King of the Pontiacs and is out of the twice 34 pound cow, Gerben Abbekerk Maid, a daughter of Sir Skylark Ormsby Hengerveld.

Miss Gelsche Walker Korndyke, whose junior two year old record of 23.17 pounds butter in seven days as a junior two year old was a state record, recently made an official record of 32.76 pounds butter from 708.9 pounds milk in seven days in the herd of Leeman & Kilgore, Ripon. This great young cow had the misfortune to have the end of one of her teats cut off last year and made her present record under that handicap. She is the third 30 pound daughter of her sire, Prince Gelsche Walker. Another excellent record made in the Leeman & Kilgore herd is that of Canary Pauline Sadie Vale, who has 21.12 pounds butter from 401.9 pounds milk to her credit in seven days as a senior two year old. She is a daughter of King Korndyke Sadie Vale 22nd, the herd sire owned by F. Stenzel, San Lorenzo.

Two more registered Holstein cows owned by E. E. Freeman, Modesto, have added to the highly creditable list of official records made in this herd during the past year. Vina Pietertje Hengerveld De Kol 2nd made in seven days 32.28 pounds butter from 844.5 pounds milk, milking as high as 129.9 pounds in one day. Her best seven consecutive days milk was 874.7 pounds. She is still on official test and her best 30 days to date shows 125.57 pounds butter from 3,461.7 pounds milk. Estrella Witkop De Kol, as a junior three year old, made 23.85 pounds butter from 576 pounds milk in seven days, and 90.47 pounds butter from 2,188.1 pounds milk in 30 days.

At the 55th annual meeting of the National Wool Growers Association, held at Salt Lake City, this month, the following officers were elected: Frank J. Hagenbarth of Salt Lake City and Idaho was re-elected president; M. J. Powers of Flagstaff, Arizona, Western vice-president; Prof. W. C. Coffey of the University of Illinois, Eastern vice-president, and Dr. F. R. Marshall of Washington, D. C., assistant animal husbandman, secretary, to succeed Dr. S. W. McClure, resigned. F. A. Ellenwood of California was appointed on the executive committee of the association.

The university farm has recently sold to the Durham Cooperative Stock Breeders Association a Romney ram, full brother to the champion ram at the recent Chicago International Livestock Exposition, bred and raised by the University of California on its Davis farm.

Recent sales from Venadera herd, Guy H. Miller, Modesto, are: The yearling heifer Arla of Venadera to H. J. Angell of Los Angeles. Arla was sired by Majestic Noble Lord out of Ila of Venadera, test 319 pounds of fat as a junior two year old, one of the R. of M. daughters of Altama Interest. The yearling heifer Eunice of Venadera to Fred C. Steiner of Hayward. Eunice is also sired by Majestic Noble Lord and her dam is Kerma of Venadera. R. of M. test 284 pounds of fat as a senior yearling, a daughter of Baron Underwood. The bull calf Jap's Humboldt Owl to Frank Ribeiro of Arcata. This calf is sired by Jap's Perfection Owl out of Lucile of Venadera, R. of M. test 329 pounds of fat in a year as a senior yearling. Lucile is full sister to Lora of Venadera, R. of M. test 504 pounds of fat in a year as a junior three year old. Their dam Lorna of Venadera, R. of M. test 588 pounds of fat in a year is a daughter of Marigold's Exile King. The heifer calf Myrtle of Venadera to S. D. Kee of Bodega. This calf is sired by Altama Interest out of Fern of Venadera, R. of M. test 401 pounds of fat, second dam Goldie of Venadera, R. of M. test 598 pounds fat in a year. To P. R. Talbott of Modesto, R. of M. cow Stella of Venadera, test 360 pounds of fat in a year as a junior three year old, sired by Altama Interest out of Anita of Venadera, R. of M. test 440 pounds of fat in a year as a three year old and dam of seven daughters in Register of Merit. The world's record for number of daughters of one cow in the Register of Merit.

CONTRA COSTA COWS

The Contra Costa Cow Testing Association is weeding out a number of inefficient cows because of the records they are making, or, rather, not making. During a recent 30 day period there were seven cows which produced more than 40 pounds butterfat or 1,000 pounds of milk. The topper of this bunch was Theda Bara, who produced 1, 299 pounds milk and 51.96 pounds butterfat.

Will You Profit By Their Experience

AWAY back some 50 years ago the Duroc-Jersey hog was introduced to the American farmer. Today he outnumbers all other breeds. It is a history of success—of increasing success—that has placed him on so many American farms. In this you find plenty of proof of why the Duroc-Jersey farm is a successful farm, a profitable farm.

Ask the Man Who Raises Durocs

Thursday, Feb. 12, 1920, In Tulare, Cal.

The Tulare County Duroc-Jersey Breeders' Association will offer at public sale

50---Bred Duroc-Jersey Sows and Gilts---50

An offering that should be of interest to every modern business farmer, the farmer that desires to eliminate wastes and add more profit to his farm operations. Not only have the herds of the Tulare breeders been drawn upon for this sale but some of the leading breeders of the state have consigned animals to this sale.

The Blood Lines

The blood lines that will be found in this sale will satisfy the most discriminating buyer. Such as **Defenders, Orion Cherry King's, Taxpayer's, Col's Crimson Wonder's, Critic's, King's Col.** Rarely will you find a greater or more popular array of blood lines than will be found in this sale.

The Boars

The boars to which these sows and gilts are bred rank among the state's leading Duroc-Jersey sires. Among them is found **Giant Wonder, Big Model, Joe's Orion Cherry King 5th, Model Cherry Gano, Johnson's Defender Jr., Royal Critic 2nd.** The litters from such matings should prove exceedingly profitable to the purchaser.

By attending this sale you will have the opportunity of securing animals for foundation herds or more profitable pork producers. Bear in mind Duroc-Jersey sows farrow large litters, raise them and they go to market early.

Sale at 12:30 P. M. Lunch at 11:30 A. M. Sale Will Be Held in the New Sale Pavilion.

Geo. W. Bell, Auctioneer

Tulare County Duroc-Jersey Breeders Association

Allen Thompson, Pres. Tulare, Cal. R. C. Sturgeon, Sec'y

PLAN A STATE WIDE LIVESTOCK ASSOCIATION

Professor J. I. Thompson, secretary of the California Swine Breeders Association, has sent out letters to all the state livestock associations requesting that delegates from each association meet at the Palace Hotel, San Francisco, Saturday, February 7, for the purpose of forming an organization of all the different pure bred livestock associations. In the letter calling the meeting Professor Thompson says:

"This association is taking the lead in this simply because its board of directors feels that it is time all of the pure bred interests of the state get together in some kind of an organization. These various associations have accomplished much good but can exert a much greater influence if they can act as a single unit. A number of the organizations that will probably be represented at this meeting are concerned with problems other than pure bred interests and believe that a movement of this kind can best be inaugurated by amalgamating the pure breds first. There are certain laws that are needed for our mutual protection and benefit, and our experience during the meeting of the last legislature in securing a pure feed law would indicate that close cooperation of everyone interested must be secured. Conditions governing the time, place and accommodations and similar details at state and county fairs, and the various livestock shows need attention. California is destined to be the greatest livestock producing district in the entire United States. The time when this will be true will be determined by just how rapidly the various associations concerned get together and accomplish the things that must be done. Let's make a start now and see if we cannot work out something that will be of lasting benefit to the entire livestock industry of the state."

DATE SET FOR HEREFORD BREEDERS' SALE

Wednesday, February 15, is the date set for the spring sale of registered Herefords under auspices of Pacific Coast Hereford Cattle Breeders Association, at university farm, Davis. J. A. Bunting, secretary of the association, announces that the entries are practically completed and it is expected that catalogs will be available within the next two weeks. A feature of the sale will be the offering of bulls, as the breeders have in mind the needs of rangemen and will sell a high class selection of bulls suitable for range purposes. There will also be a notable offering of females, many of them in calf to the best western sires. C. L. Hughes, Sacramento, will manage the sale.

WILL SELL A WORLD'S CHAMPION

The announcement that J. Francis O'Connor, proprietor of the Castleview Ranch, Santa Rosa, will catalog the great sow, Rookwood Lady 100th, grand champion at the 1917 National Swine Show, for his sale to be held February 14, has caused widespread interest. Rookwood Lady 100th has long been regarded as one of the greatest sows of the breed. She is a living refutation to the theory held by many that show animals are not valuable in the breeding herd. Rookwood Lady has a long string of show yard victories and has been a regular breeder, having a record of two litters per year. She will sell bred to Achiever. Including the above sow, O'Connor will sell 25 bred sows and gilts of popular and fashionable blood lines. The sale will be the first public sale ever held by a Sonoma County breeder.

GUARANTY SALE OF HOLSTEINS

Entries have practically been completed for the Guaranty Sale of registered Holsteins to be held at Sacramento on March 25, under management of California Breeders Sales and Pedigree Company. While a final survey of the entries has not been completed, it is safe to say at this time that the Holstein breeders have surpassed all previous efforts to make the best individuals available at public sale. The sale will have the largest list of consignors that has yet appeared in any western sale.

One of the latest and most interesting government crop reports deals with California alfalfa, and it is almost startling in the development shown. The 1919 crop in this state was 143 per cent of the 1918 crop and the price 100 per cent higher. The value of the last alfalfa and other tame hay crop (1919) is given as $73,220,000 and of the wild hay crop, $2,460,000.

One tract of 2,000 acres will be planted to alfalfa near Delhi, Merced County. It will require an entire carload of seed.

35 BERKSHIRES

of the Highest Quality make up the Annual Guaranty Sale of the

Western Berkshire Congress

at the University Farm

Davis, Cal., Wed., Feb. 18 1:30 P.M.

Following the Annual Congress Meeting, Tuesday, Feb. 17

This is the opportunity for the farmer or breeder to secure, at his own price, outstanding animals of the breed that won grand champion pen, and carlot and junior champion barrow over all breeds at the San Francisco Live Stock Show last November, proving them to be the hog the farmer wants—the best pork producer.

Careful selections of 30 bred gilts and sows and five young boars have been made from the herds of the following breeders in four states:

A. B. Humphrey, Escalon, Cal.
Castleview Ranch, Santa Rosa, Cal.
R. G. Gruhlke, Dixon, Cal.

40 Bred Sows and Gilts

Big Type---Size and Quality

12 Tried Sows:

These sows are just that—they have been tried and proven good producers in some of the best herds in the county. They are big, heavy boned, smooth, deep, motherly sows that represent very choice blood lines. Several of them have produced show winners. Any farmer, breeder or pig club boy can buy such sows for a foundation and be certain of producing the right kind of Poland Chinas.

15 Bred Gilts:

These gilts have been selected from the tops of the following herds: Geo. V. Beckman & Sons, N. K. Horan, J. F. Lehman, Langhorst Bros., Eugene Miner, John Boskovitch, Young & Barton and Young & Clark. A number of the gilts have show records, others are litter mates to prize winners and all are bred to the outstanding boars owned by members of the association.

12 Open Gilts:

The man who has his own good boar and needs a few outstanding brood sow prospects will not need to look further than this sale. Among the lot will be found gilts that will look well in any herd in California. The type is right—the breeding is right.

"Lady Victory"

1918 Champion laid 304 eggs in 365 days. Highest official record of any living hen. She laid 25 eggs in Jan., 27 in Feb., 29 in March.

Milkoline will help make your hens lay more eggs.

Feeding Milkoline will make you more money —reduce mortality of your flock— keep flock healthy and less liable to disease.

Increase Poultry Profits

Any poultry raiser can easily double his profits by doubling his egg production. Feeding **Milkoline** with other feed greatly assists assimilation, keeps digestive organs vigorous and is a wonderful appetizer, tonic and bowel regulator. **Milkoline** contains nutritive elements vital to egg production and not found in grain rations.

13,000 More Eggs

Jas. E. Keyes, Petaluma, Calif., says: "After feeding **Milkoline** for eighteen months to 2,500 hens, I find that worms cannot exist in poultry where **Milkoline** is used. I reduced mortality with laying hens 10 per cent. I increased the egg production of my flock **thirteen thousand eggs** in one year. Feeding **Milkoline** to laying hens keeps them in splendid health thereby preventing disease and derangements of all kinds."

Milkoline

has a base of modified buttermilk with essential fats and acids added. **Milkoline** comes in condensed form. Will not mould, rot or sour. Keeps indefinitely in any climate. **Milkoline** is simply **"Good Buttermilk Made Better for Feeding."** Flies don't bother it.

Lowers Feeding Cost

Many feeders say **Milkoline** lowers feeding cost one-third, because their hens assimilate all feed they eat. Our liberal **Guaranteed 30 Day Trial Offer** enables you to try **Milkoline** at our risk—to prove that it will make you mighty good money.

Prevents Disease

Milkoline is not featured as a cure for anything or a preventative, but due to the acidity in the buttermilk it is a germ destroyer and helps keep poultry healthy, which is the best preventative against disease. **Milkoline** is invaluable as a life saver for baby chicks.

PRICES

These prices are F.O.B. Kansas City or the address of our nearest dealer. Dealers in all parts of the United States.

5 Gal. Keg - $7.50
10 Gal. Keg - 12.50
15 Gal. Keg - 16.50
32 Gal. Barrel 32.00
55 Gal. Barrel 49.50

Prices on smaller packages given in booklet. Buy in barrel lots—it saves you money.

Only 2c a Gallon

For feeding mix one part of **Milkoline** to 50 parts of water (small feeding 5 tablespoons to gallon of water). Feed either with water or mash feed. **Milkoline** keeps their appetite keen and its action is highly essential to normal egg production. When fed as directed **Milkoline costs only 2c a gallon** or less. Trauhaft & Newman, Lankershim, Calif., say: "We would not go back feeding straight buttermilk at any price."

Guaranteed Trial Offer

we will ship you 1 Gallon for $2.25, **express prepaid.** Take 30 days—feed half to your poultry. If not entirely satisfied simply return unused portion and we will refund every cent you paid us. No charge for portion you have used. **Milkoline** is legally guaranteed to be satisfactory. You are always the judge. We suggest ordering larger quantity—you get the benefit of lower price—you risk nothing—you must be satisfied or we refund every cent you paid us. **Make this test now.** The sooner you begin using **Milkoline** the quicker you will be making money.

Milkoline has been producing so many amazing results and we are so certain of what it will do for you that

The Best Brooder

By Jean A. Koethen

NOTHING pleases me so much as to receive a query with real "punch" in it. The following is full of that most desirable article, and I have had to put on my very best thinking cap to answer it. This is the query, which comes from a Van Nuys subscriber:

What is the best way to raise 200 baby chicks? I have no time to heat water jugs.

No, one would hardly wish to heat water jugs to keep 200 chicks warm. It might be managed for 20, but not for 200, surely.

In these days of high prices one must use what he has. If he has a shed or colony house in which a small brooder stove or electric hover can be placed, the best way is to buy such a stove or hover and use it. As between the two there is not much choice. Electricity used to be more expensive, but I doubt if it is now. The electric hovers come in several sizes and can be used in buildings where other heating is not practicable. If I had a place to use it and money to buy it, I should certainly try an electric hover. There is no filling of lamps nor sitting up nights with a stove. You just press the button and the thing is done.

Fireless Brooding

The cheapest brooding, next to that done with hens, is fireless brooding, and since fuel has become such a problem I look to see it employed far more than it ever has been in California. If Mr. Philo could raise Orpingtons in a snowbank in New York without heat it looks as if the lightest breed might be successfully brooded by that method in most parts of California. There is this against fireless brooding, however—it is more work. Chicks are sometimes brooded without heat in brooders containing a hundred chicks, but they do better if not more than 25, or at the outside 50, are placed in one box. When more than 50 are brooded together the greatest care must be exercised to make sure that the chicks are abundantly warm, else they will pile up in a corner. Twenty-five chicks, well covered with soft quilts, with straw and tarred paper beneath, will keep comfortably warm by the heat of their own bodies if their brooder box is built to fit them. But 200 chicks in lots of 25 means eight boxes to begin with and twice that number, or boxes twice as large, after the first month. Training chicks to go into the boxes to get warm is something of a job, and cleaning the boxes daily is a bigger one, but elbow grease is cheaper than gasoline —sometimes—and this kind of brooding has been tried and tried successfully by many people.

I have mentioned more than once a brooder coop I saw in Riverside last year. It was about the size and shape of a piano box, only wider, and its six feet of length was divided by wire into six little runs. Back of each run was a brooder box large enough to contain 50 chicks, and in front of each was a pane of glass. The door was hung at the top and reached to the top of the glass. When this coop was flooded with sunshine no other heat was needed, but at night, after the chicks were tucked away in their boxes under the quilt, light was turned on in a large electric light globe which hung suspended from the top of the coop. This little bit of electricity modified the chill night air considerably, and the chicks thrived amazingly.

Fireless brooders must always be used in some sort of coop, but the coop may be very simple. A dry goods box set on its side facing the sun makes a very good one. An ordinary open front colony coop provided with a curtain which can be closed at night ought to hold 200 chicks, though it might not hold their eight brooder boxes. It is very important that whatever coop is used be placed in a sunny, protected place. The Philo coop, you remember, is a bottomless box six feet by three, with a lid which can be slanted at any angle. Such a coop would be rather expensive now, and it was always hard to handle. I much prefer the open front coop.

I do not know that I have answered the question I started to answer, but it may be some of these suggestions will be helpful to beginners who want to raise chicks with the least outlay for equipment.

Let the Buyer Beware

A Northern California subscriber writes: "Would you kindly supply me with a list of poultrymen who you know do really trapnest their hens and from whom one can rely on getting just what he orders. I want this to apply more especially to White Leghorn breeders. Just yesterday I visited a poultry ranch of considerable proportions in another part of the state, and this ranch advertises trapnested stock. Now, when I got there I found that there is not a trapnest in use on the place. That kind of stuff hurts the poultry business. Something should be done to protect honest poultrymen and the public as well."

There is an old Latin proverb which applies to the purchasing of poultry and eggs as well as to most other business transactions, "Caveat emptor," let the buyer beware. By common consent and general practice most twentieth century advertising goes somewhat beyond the mark and must be taken with a grain of salt. Of course the man who advertises trapnested stock when he hasn't a trapnest on the place never gets anywhere. He may deceive a few honest customers and put a few dollars in his pocket before his dishonest practice is found out, but sooner or later (and it is apt to be sooner) he drops from the ranks of breeders.

When a pedigreed goat is sold the seller is expected to furnish a certificate showing the ancestry of the animal. When one is buying what purports to be trapnested stock a similar certificate should be insisted on, or at least a certified egg record. The thing is not only quite possible, but it is bound to come.

The trouble is that the general public—I mean the egg producing public—is not educated up to the need of egg records nor of trapnests. Of late the poultry press has been flooded with recipes for picking out the layers without trapnesting. However useful these systems may be, they cannot pick out the high producing individuals. A man may increase the production of his flock by such a system of culling, but he can never build up a pedigreed strain. I am mailing you the names of some people who I know do trapnest. I wish the list were longer, and it will be another year, I am sure, for the past fall, when eggs brought 80 cents or more for two months, the trapnesters simply walked away with the poultrymen who guessed.—J. A. K.

AMERICAN EGG LAYING CONTEST

By T. E. Quisenberry, Director

The birds in the American Egg Laying Contest at Leavenworth, Kansas, had a little setback in December on account of some severe changes in the weather, but at this time are showing a marked improvement and the indications are that they are now getting a good start toward a good record in 1920. At the beginning of every contest there is always more or less trouble in getting the birds acclimated and accustomed to their new houses, new methods of feeding and so forth. That period is now passed and we look for splendid records from practically all pens from this time on.

The ten leading pens for December were as follows: White Orpingtons, Ohio, 137 eggs; White Orpingtons, Ohio, 131; Barred Rocks, Kansas, 126; White Wyandottes, Pennsylvania, 122; S. C. White Leghorns, Iowa, 115; S. C. Reds, New York, 114; S. C. Reds, Illinois, 113; S. C. White Leghorns, Pennsylvania, 112; Barred Rocks, Kansas, 110; White Orpingtons, Ohio, 107.

S. C. Rhode Island Reds are in the lead with 205 eggs and the White Orp-

ingtons in second place with 203 eggs. The best pen in each variety to date: Brown Leghorn, 115; White Leghorn, 198; Ancona, 127; White Plymouth Rock, 173; Barred Plymouth Rock, 154; S. C. Red, 205; White Wyandottes, 198; Rhode Island White, 151; White Orpington, 203; Patridge Wyandotte, 152.

Each pen in the contest contains five birds, each of which are numbered consecutively from one to five in each pen.

FEEDING BEES

There may be abundance of rain yet. In any case it is safest to prepare, and the only way to prepare the bees is to encourage them with sufficient feed to build up fine strong colonies. This may be accomplished by method of feeding which is described by M. H. Mendleson in the January issue of the Western Honey Bee:

"In making syrup for feeding bees it is imperative to avoid having the syrup granulate and consequently be wasted. I use the following method: For every ten to 14 pounds of water, mix 20 pounds of sugar, and a level tablespoon of tartaric acid. Bring the water to a boil. Then dissolve the acid in the boiling water then dissolve the sugar, and bring to a boil.

"It is of great advantage to feed the syrup while warm, but not hot. The warm syrup (at this time of year) helps to warm the atmosphere of the hive, and the bees carry out the syrup more readily. I used to make the syrup without the acid, but now and then the syrup would granulate, in spite of all precautions.

"I use the Doolittle feeder with a float within. I crowd the bees upon a few combs (according to their strength) to prevent their scattering the syrup beyond the cluster, and also to crowd the queen into a small brood space, for economy in the consumption of the syrup. I contract the hive entrance to protect from cold and from robber bees.

"I have the entrance near the cluster; if on the opposite side it entices robbers. I contract the entrance according to strength, from a bee space to enter to one or two inches long. and when spring and warm weather come the entrances are enlarged.

"I find that an empty super (with a cloth underneath), filled with chaff or shavings, and placed on top of the brood chamber, will absorb all moisture from the bees and make them more comfortable for the winter, with less consumption of stores.

"Prolonged feeding will stimulate brood rearing and excessive consumption of stores. So at this date I feed them nearly all they need to carry them over until spring, and force them to carry down the syrup as rapidly as possible. There is now and then a colony which will use up an excessive amount of stores, and out of season at that."

BEE INSPECTORS ORGANIZE

An important meeting of the county bee inspectors of the state was held in Los Angeles a short time ago for the purpose of organizing into an acting unit in securing proper legislation to protect the bee industry of the state. The inspectors were called together by Inspector George De Sellem of Los Angeles County and temporary officers were elected. A second meeting will be held on February 7 for the purpose of completing the organization and electing permanent officers for the year. B. H. Stanley of San Bernardino County was made temporary secretary.

HELPS THE PROCESS

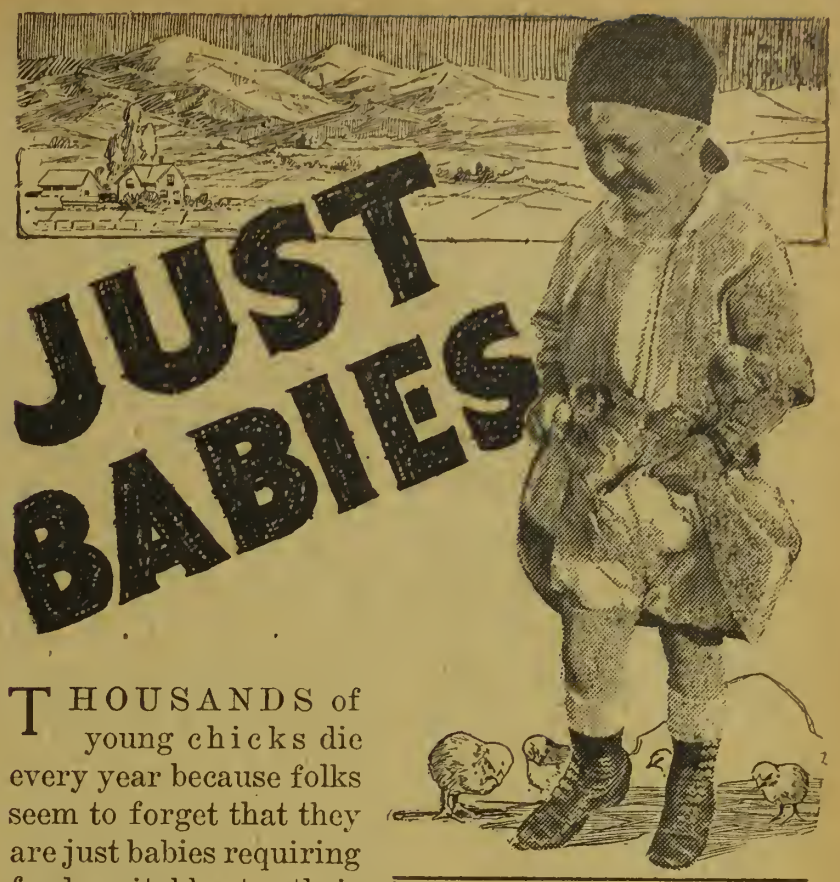
"Stop!" thundered the man in the barber chair, who was having his hair cut. "Why do you insist upon telling me these horrible blood curdling stories?"

"I'm sorry, sir," said the barber, "but when I tell stories like that the hair stands up on end and makes it much easier to cut, sir."

SHE USUALLY DOES

Never confide your secrets to a woman even though you call her dove —she may turn out to be a carrier pigeon.

Kerman, Fresno County, is taking steps to protect its rights to waters of the Kings River.



THOUSANDS of young chicks die every year because folks seem to forget that they are just babies requiring food suitable to their baby bodies.

Give your chicks a fair chance. Start them on Globe "A-1" Baby Chick Mash, *(containing Dry Buttermilk)* and watch the little fellows thrive.

FOR GROWING CHICKS

After your chicks are about six weeks old change the ration to Globe "A-1" Growing Chick Mash (containing dry buttermilk) and when the pullets are five months old begin to feed Globe "A-1" Laying Mash (containing dry buttermilk) and get ready for the full egg basket.

There is practical and scientific knowledge put into Globe "A-1" Baby Chick Mash. It isn't just feed. **It's that and more—a health protector.** The generous quantity of pure dry buttermilk which it contains gives it this invaluable property. The lactic acid content cleanses the baby chick's system, and protects it from the ravages of disease. **(It has proved a preventative of white diarrhoea and coccidiosis).**

Nutritious hearts of grains, meatine, selected whole ground grains, and plenty of pure dry buttermilk,—that's Globe "A-1" Baby Chick Mash.

"One raw fur house which can be relied upon"

When you ship your raw furs to H. Liebes & Co. you will get the same fair and square treatment that Ulysses Bonetti of California does. Read what he says about the way H. Liebes & Co. treat trappers—

"I am sending you another lot of furs and will send you all I trap because I have found that H. Liebes & Co. is one raw fur house which can be relied upon to do the right thing."

Trappers who want honest grading, fair prices with no commission charges, should send their furs to H. Liebes & Co.—the largest manufacturing furriers in the West. Write for our price list today.

H. Liebes & Co. pay express or parcels post and send you your money the day your furs are received. Remember if you're not satisfied, return our check and we'll send your furs back, prepaid. Isn't that fair?

PACIFIC PIPE CO. 237 HOWARD STREET SAN FRANCISCO

One tea is advertised as 400 cups to the pound; another as 300.

Would you like to know how many cups a pound of Schilling Tea makes?

We'll tell you if you tell us how strong you like your tea, how long you let it stand on the leaves, how near you are willing to get to the tannin-taste, and how large your cups are.

We'll tell you this anyway: Schilling Tea makes more cups to the pound than any tea we know of, and is the cheapest per cup.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

A Schilling & Co San Francisco

DOLL DRESSMAKING

By Virginia G. Stanard in Youth's Companion

We cut, we trim, we scallop,
As busy as can be;
It takes a lot of labor
To dress a family.

Girl dolls are very careful
About the styles, you know;
They like becoming colors
And hats that sit just so.

We snip, we tuck, we gather,
We seam the whole day through:
If dolls grew fast as children,
Whatever should we do!

THE DESERT FEUD

By M. E. Bemis

(Continued from last week).

We had the smouldering fire. These two young fools had spilled the coal oil, as it were, upon the coals, and we were watching and momentarily expecting the flash which should be the outbreak of the feud that had resulted. Under such a nervous tension we traveled for weeks.

In all the party there were only two who were entirely neutral, so far as outward appearance was concerned. One of these, as you might expect, was Captain Sprowle, who, so far as I know now or could observe then, favored neither one side or the other. He issued his orders to all impartially. He called into consultation members of both factions, urging them to use care in the discussion of all subjects which would in any way be likely to precipitate matters. The other neutral was a little girl of four years, the only child of William and Alice Brown, who were taking their all, which consisted of two cows and a team, into the new land to take the chances of pioneer's fortune. Little Alice, as the child was called, had become from the first day out a general favorite. When camp was made she walked around from one group to another and none had any but pleasant words, and frequently gifts for her. Curiously enough, her two favorites among the party were Mary Andrews and John Brent. A friendship for these two had begun from the first and continued. When the climax came her childish mind could not see any reason for forsaking either, and although Brown as a soldier under Major Andrews sided with him, both he and his wife were too sensible to try in any way to make the quarrels of the elders the trouble of a child.

So it happened that she still went from group to group. In the day time she rode with one family in one wagon and then with another, indifferent as to which faction they belonged to. At night she teased for stories from first one and then another, and her cunning ways enlivened the seriousness and helped in a measure to relieve the tension. John Brent whittled toys for her, sometimes a doll which she took at once to Mary Andrews, who had her first lessons in sewing in learning to dress the dolls of little Alice.

In spite of the feud Mary Andrews was learning rapidly some of the things which had been neglected as a part of her education as a southern belle. She occasionally assisted, in a surreptitious, half ashamed manner, the women in their work. She learned to ride, not as the ladies of her set had ridden, but as the frontier woman rides, as a part of her horse, easy, free and in that way which is untiring both to the rider and the horse. I often caught Brent's admiring eyes following her as she gracefully skimmed the prairies, circling the train and sometimes helping to herd the cattle as we drove them along. She learned to handle fire arms, not only to shoot and shoot well, but to load and care for both rifles and revolvers.

The cause for the quarrel was melting away, but in the heat that had been kindled none seemed to notice the change that was taking place.

Things went on in this way, each expecting and dreading the time when someone with overwrought nerves should precipitate the crisis which would end as all feuds end. Men went about with serious faces; women talked with hushed voices; of all the party none were indifferent or joyful except Little Alice. And then there came a morning when Little Alice did not make the rounds at breakfast time. All missed her and inquiry disclosed that she was ill. All night she had been feverish and restless. The older women tried the simple home remedies, but she grew steadily worse, and as the train made its slow way across the desert wilderness, those close to her father's wagon could hear the low wails that came from the poor, painwracked, fevered little body.

Early in the afternoon Captain Sprowle ordered a halt and camp was pitched in the hope that it might bring relief to the sufferer, but without avail. Towards night she seemed to gain consciousness and recognized her father and mother. Mary Andrews was also at her side and Alice smiled at her and tried to talk of her playthings. In a few moments she said, "I want my John," as she was in the habit of referring to John Brent. Her father at once went in search of him. Mary blushed and attempted to withdraw, but Alice held her hand tightly, and responsive to the pleading look in the mother's eyes she remained. Brent soon came and seeing Mary turned away, but the child's mother said: "Little Alice Wanted you, Mr. Brent, and would not let Mary go." The sick child smiled at him and held out her other hand, and he sat down opposite Mary. Together the two tried to relieve the paroxysms of pain by bathing her brow, talking to her in an attempt at the old jolly way of pleasing her. Together these two watched with the parents of the stricken child the quick short breathing that betokened the approaching end. After a little the child opened her eyes and holding more tightly the hands of each, she said: "Pease don't fight no more." Together they watched the tired lids close for the last time over the bright eyes that had been the light of the travelers and especially of these two.

Slowly Brent came back with bowed head. A few hours later Captain Sprowle came with a shovel and handed it to Brent and with a voice that choked he said: "It has to be John. We must bury the child at daylight for we have to leave at daybreak on account of making camp tomorrow night where there is water." I went along with Brent to hold a light while he dug the grave. Pretty soon Mary Andrews came out and saying to me, "Bill, you go back and try to rest a little, I'll hold the light," she took it from my hand and together the two finished the grave of the child that had begged as a dying request: "Pease don't fight any more."

What they may have said there that night under the stars only God and the angels know, but in the morning when the eastern sky was turning gray and all that was mortal of Little Alice was brought out for the burial John Brent and Mary Andrews stood side by side as the rude coffin was lowered into the grave and scattered desert flowers upon its lid. As the last of the earth was heaped upon the grave she turned to Brent and asked: "Shall we sing, John?" and together their voices blended in the hymn, "God Be With You Till We Meet Again." Major Andrews brought a rude cross that he had spent the night in making and erected it over the grave that the men covered with stones. Captain Sprowle offered a simple prayer with a peroration, pleading that the calm and peace which had fallen upon this little one might pass to those who sorrowed in forgetting their differences and in the contemplation of the higher and more worthy ideals of life.

The camp broke, and in the last of the train of wagons looking back towards the lonely grave, with eyes that could not see for the tears, were the parents of Little Alice, their firstborn. Theirs was the price that pioneers have paid for the privilege of paving the way for civilization. Perhaps through their tears there may have come a vision of the after years, of other children in a happy home in a peaceful land of cattle, of broad fields of alfalfa and a community that was the better for their having lived in it, for those things were to be, but to the longest day they lived would never be forgotten that lonely grave on the desert.

Up in the front rode John Brent and Mary Andrews, side by side, into the dawn of the new day and into the

The Cultivator Patterns

BE SURE TO SEND SIZE

3109—A Unique Model. Cut in three sizes: 16, 18 and 20 years. Size 18 will require 5⅛ yards of 44 inch material. The width of the skirt at lower edge with plaits exteuded is 1⅞ yard. Price 10 cents.

3123—A Dainty Frock. Cut in four sizes: 4, 6, 8 and 10 years. Size 10 will require four yards of 27 inch material. Price 10 cents.

2841—Ladies' Apron. Cut in four sizes: Small 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. Size Medium requires 4¼ yards of 36 inch material, with 1¾ yards of banding, 2¼ inch wide, for neck and front. Price 10 cents.

3117—A New Corset Cover. Cut in six sizes: 32, 34, 36, 38, 40 and 42 inches bust measure. It will require 1⅜ yard of 36 inch material for a 38 inch size. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest Chicago styles, all pattern orders are filled in Chicago. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
California Cultivator
Los Angeles.

dawn of a new life. Each had learned a lesson, and in the learning there had come the sweet satisfaction of knowing that humanity must share its burdens as well as its sorrows with others, that each is a part of a great whole with rights which others are bound to respect, but with duties that are, as others' rights, equally imperative.

Not one of all the number but was bowed in sorrow, but deep as the sorrow and sincere as was the sympathy for the parents, we knew that in dying Little Alice had not died in vain for in her grave there had been buried forever the feud of two foolish young folks.

The last dying ember of the fire broke and fell, disturbing the silence that followed the old man's story. From the street floated up sounds of the everyday world. Paxton blew his nose violently as a pretext for wiping from his eyes a suspicious moisture. Old Man Hendricks threw away the stump of his cigar, lighted another and rising, walked over to the elevator and pushed the button to descend. Dawson called after him: "What became of John Brent and Mary Andrews?" "That sir," said the old man, "is quite another story. Several of them, in fact. This one, as I told you at the beginning, ends with a funeral."

COOPERATIVE BUYING

By this I mean neighbors or relatives or members of a club buying common articles together and getting in many cases wholesale rates—for example, boys' corduroy pants, overalls, men's and boys' underwear, etc., also shirting by the bolt makes a considerable saving and the uses of shirting are legion—boys' blouses and shirts, aprons, rompers and creepers, bloomers and everyday dresses for girls.

Then, too, it is a wise plan for a number to buy thread, needles, etc. They are always cheaper in large lots and always needed.

By the way, there is an extra good grade of shirting that is 36 inches wide and cuts to excellent advantage.

Don't buy remnants unless you know just how much of the goods you need. You often have pieces left over and your remnants may cost you more than goods by the yard.

I have found that patterns are not always reliable in giving the amount of goods needed, so that it is a wise plan before buying goods to lay your pattern over it and see if it meets the requirements.

As far as possible get yard wide goods and goods having no right or wrong side. It cuts to much better advantage.

It is a wise plan to shrink goods that shrink much in washing before cutting them.

It is the part of wisdom to patronize sales of reliable houses, especially after Christmas sales and end of August sales, but don't buy things you don't need because cheap.

Pretty dresses for small girls can be made from a small remnant of gingham or linen for the skirt part and an outgrown blouse of an older brother for the waist part. Cut out the old collar, add a collar of new goods and cuffs. Finish with a belt, and presto! a new dress. Since sateen is so high dark blue or black galatea or devonshire cloth make good bloomers for little girls.—Reader, Santa Paula.

ECONOMY IN CLOTHES

By Mrs. Ward L. Jones, Stockton

In answering your call in the Cultivator for suggestions as to economizing in clothing, I have a few hints which might be helpful.

In making children's play dresses I find I can make a dress for a little girl from one to three years of age from a shirt which my husband has discarded. The sleeves of the shirt make the sleeves of the dress and the front of the shirt makes the back of the dress, thus saving one the trouble of making new buttonholes. Pockets may be added on which a little bunny, a duck or any design may be outlined. If the shirt has a pleated front I make the dress with a little yoke, using the pleated front of the shirt for the yoke of the dress.

In making house dresses and small house aprons, I find flour sacks can be used to good advantage. A very pretty breakfast set may be made by dyeing flour sacks any desired color and making collars and cuffs of white and a little cap to match. House dresses may be made that are certainly durable and very pretty by using the sacks the way they are using pieces of left over gingham or percale for collars, pipings, pockets, etc. The letters on the sacks may be removed by first soaking them over night with naptha soap, then boiling in suds to which a little kerosene has been added.

HOW TO ECONOMIZE ON CLOTHES

By Beulah May

How to economize on clothes is some problem. Dyeing of course helps many a faded dress along, but one must have new ones sometime. The only sure way I know is to make one's own clothes. It is not so hard. I made a beautiful coat this fall from a gray army blanket; cost of material, pattern, etc., $8. A faded cotton dress of rough texture, if dyed, makes a very pretty smock.

Use good pieces of a worn silk waist for camisoles.

Watch the sales, but never buy a piece just because it is on sale unless you really need it.

COOPERATIVE BUYING

A very businesslike suggestion is offered by our "Santa Paula Reader." Why not cooperative buying of staple dress materials? Farmers are being driven to cooperation in every other line and workable methods are being found.

Has our "Santa Paula Reader" made an actual test of cooperative buying with friends and neighbors? If she has all of us who read this page would like to hear more of how she has gone about it and how it works.

May we not have another letter with more information? Meanwhile we would also like to hear from anyone else who has ideas to express on the subject. Prices are still mounting!—R. P. D.

AWARDS IN HOUSEHOLD CONTEST

To Anna Lenington Heath, Pomona, first prize, $2, for "The Fight With Old H. C. L.," published in last week's Cultivator; to Reader, Santa Paula, second prize, $1, for "Cooperative Buying"; to all others whose letters are published one year's extension of subscription to California Cultivator.

THIS WEEK'S PATTERNS

The skirt 3104, giving the wide flare just below the hips, is exceedingly becoming to most figures—and is new. The stout woman need not shun this style, as she must the usual widening effect at sides of skirts, for this width is given not by fullness but by a straight line and the width comes below the wide part of the hips so that it gives an exceedingly trim effect. The cut of the back too takes away the trying "broad" look at the back.

The long waist of 3109 is becoming to the short waisted figure, if there is enough length from the waist down so one is not "cut in half." Beware of long waisted effects if you are also short legged.

A sweet and dainty way of making a little girl's summer dress is shown in 3123. 3099 gives the new narrow shouldered effect very gracefully. A simple darned edge for trimming, stitching or simple braid as indicated in the picture is very pleasing.

Two more good house dresses or work aprons. They are so simple and easy to make, such a model as 2841 requiring really no fitting, that one cannot afford to buy ready mades at any price unless they are of material that will wear and wash well.

The sturdy straight little boy's suit 2748 will help find a way of using some of Daddy's duds that are ready for passing on.

A new corset cover 3117, without back or front closing to show under a filmy waist, will appeal to every girl. A number of ways of modifying this style are shown and others will at once occur to the home dressmaker. By cutting the sleeve portion a little longer a short kimono sleeve can be made for those who dislike the open arm.—R. P. D.

WORDS INSTEAD OF ACTION

There was a man whose nature balked
And tempted him all toil to shirk.
About "efficiency" he talked
And thus avolded real work.

A Barn Is Worth Careful Planning--- Isn't a *HOME* Entitled to as Much?

Well planned barns increase profits because comfortable livestock thrives better. Good barn equipment saves manpower and time.

Isn't Home worth the same amount of attention? Home, where mother begins and ends her many duties, where the children grow up and learn to appreciate worthy things through the examples about them, demands as good planning as the rest of the ranch. The happiness of the family circle should never be clouded by household drudgery or unpleasant furnishings.

Free Helps For Home-Makers

A successful home is well planned—every item of Furniture and Furnishings has been thought over and discussed by all the family. It grows in beauty and comfort because of wise planning. Its charm is maintained by constant attention.

To plan wisely is not always easy, so Barker Bros. for years have made it a practice to help those who plan their homes, by issuing booklets, magazines and catalogs about the things and the ways of making better, successful homes.

They Are Free For The Asking

These publications, listed and described below, will be sent FREE to any home lover making the request. No obligation or bother. Just clip out the coupon — mark the things you want — pin the coupon to a sheet of paper and mail to Barker Bros., Dept. D.

Barker Bros

General Catalog of Furniture will be announced later and offered you free. (Dept. D)

Bargains *in* Food

The place to seek bargains in food is in your own land where a few *cents* invested in seeds bring *dollars* in return.

Note the following large returns possible from Morse's Seeds—and plan now to raise vegetables on your own land for your own use and for the market:

2 oz. cabbage seed costing $1.00 produce 20 wagonloads
2 oz. tomato seed costing $1.00 produce 10 wagonloads
4 lbs. onion seed costing $7.00 produce 8 wagonloads
6 lbs. carrot seed costing $6.00 produce 40 tons
6 lbs. beet seed costing $6.00 produce 40 tons

How else can you make your money yield such large returns? But be sure you get all your seeds from Morse, Morse's Seeds are soil-tested and true-strain. They grow and produce. They yield large crops of fine vegetables. Write today for quotations on larger quantities of the seeds listed above and for all other seeds you need.

Write today for the 1920 Garden Guide, a practical manual of Pacific Coast planting. It will help you —and it's free. A post card mailed today brings it

Calves—Light, 13@14.

Hogs—Top packer, hard and well finish-

A Quality Combination

THE **International 8-16 Kerosene Tractor** is a tractor of character and personality. The first note of appeal is the graceful, trim design, the general compactness and the good balance of the tractor, with just the right distribution of weight on the front trucks and drive wheels. The next thing that strikes you is the absence of exposed working parts; everything is enclosed as protection against the grinding action of dust and dirt.

And you are impressed by the flexible range of the drawbar, making it possible to pull a harrow, plow, binder or wagon with equal advantage and by the convenient pulley so placed that the tractor can be backed into the belt in a hurry, with no chance for the belt to drag on the ground or rub against any part of the tractor.

And coming down to more technical but nevertheless very important details—there is the throttle governor that regulates the fuel to the load; removable cylinder sleeves in the engine so that if a cylinder should become scored through the use of poor lubricating oil, for instance, a new lining can be put in at once, renewing the cylinder; centralized auto-type control, making this tractor as easy to handle as an automobile.

These are only a few of the desirable characteristics of the **International 8-16 Kerosene Tractor.** The catalog that we have ready to mail you will give you the rest. Or, see your International dealer and examine his sample 8-16 for yourself.

Sultanas, 16s, 15¼; Sultanas, bulk, in 25s, 14¼. Layers: 6-crown, flat pack, 20s, per box, 4.05; 6-crown, flat, 10s, per box, 2.20; 6-crown, flat pack, 5s, per box, 1.20; 4-crown, flat pack, 20s, per box, 3.20; 4-crown, flat pack, 10s, per box, 1.75; 4-crown, flat pack, 5s, per box, 1.00; 3-crown, tray pack, 20s, per box, 3.10; 3-crown, flat pack, 20s, per box, 2.95; 3-crown, flat pack, 10s, per box, 1.60; 3-crown, flat pack, 5s, per box, 95; clusters, 20-1s, cartons, 3.45; clusters, 12-2s, cartons, 3.30; clusters, 4-5s, cartons, 4.50; vineyard run, 100s, 13.00.

GRAIN

Wheat: The prices are based upon federal grades and standards at the terminals in San Francisco Bay and Los Angeles, and are as follows, per bushel of 60 pounds:

Hard White—	Per Bushel	Per Cental
No. 1	$2.20	$3.66 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.13	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51⅓
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.09	3.48⅓

The above are minimum prices.
For sacked grain add 4½ cents per bushel of 60 pounds to above prices. Deductions of tbree-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.
Oats: Red feed, 3.30@3.35; black, 3.50.
Corn: California yellow, 3.15@3.25 per cental; Egyptian white, 3.75@3.80; milo maize, 3.25@3.30.
Barley: Spot feed, per cental, 3.60@ 3.65; brewing, 3.65@3.75.

HAY

Under date of January 24, Scott-Magner & Miller says:
Receipts past week 2,228 tons. Although these receipts are quite heavy for this time of the year, much of the hay has been ordered in for recompressing to fill government contracts for shipment to Hawaii and the Philippines; the government having called on contractors during the past week for some 2,000 tons for delivery shortly. The general hay market in San Francisco is quiet, yet prices are higher than for some time past. Demand from country districts continues heavy, nearly all sections requiring more or less hay for feeding. The recent rains have been a fizzle in practically all sections with the exception of on the lower Coast where they received about one inch of rain. The balance of the state received from one-quarter to one-half an inch, which is of course of great benefit—at the same time nothing compared to what is required at this time. Every little bit of moisture will be a great help and we are thankful for what we have received, yet all are praying for more rain soon. Weather conditions have been most abnormal to date and unless great changes come shortly not only will those crops depending on the rain be severely affected but the irrigation districts will have very little water and the power companies will be almost out of business as very little snow is in the mountains at the present time. Under these conditions we look for the hay market to go still higher as stocks are unusually short in this state, and although we are calling now on surrounding states their supply is limited.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses are to be added according to conditions:

Fancy Wheat Hay (light 5 wire bales)	29.00@31.00
No. 1 Wheat or Wheat and Oat Hay	26.00@30.00
No. 2 Wheat or Wheat and Oat Hay	25.00@27.00
Choice Tame Oat Hay	28.00@31.00
Other Tame Oat Hay	25.00@28.00
Wild Oat Hay	24.00@27.00
Barley Hay	24.00@27.00
Alfalfa Hay	26.00@31.00
Stock Hay	21.00@24.00
No. 1 Barley Straw, ton	.50@ .80

Citrus Markets

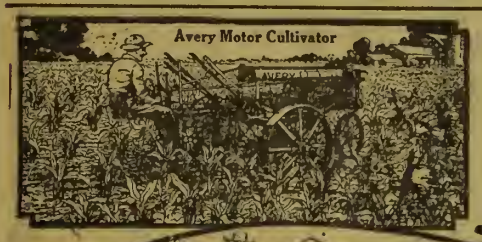
Los Angeles, California,
January 28, 1920.

Auction centers have shown many low sales of oranges due to the "frozen-in-transit" fruit that is showing up. Navels brought yesterday in the New York market $1.90-6.25. Now that danger of frost damage in California has passed, and with the assurance of a very short crop, it is expected that the market will advance steadily.

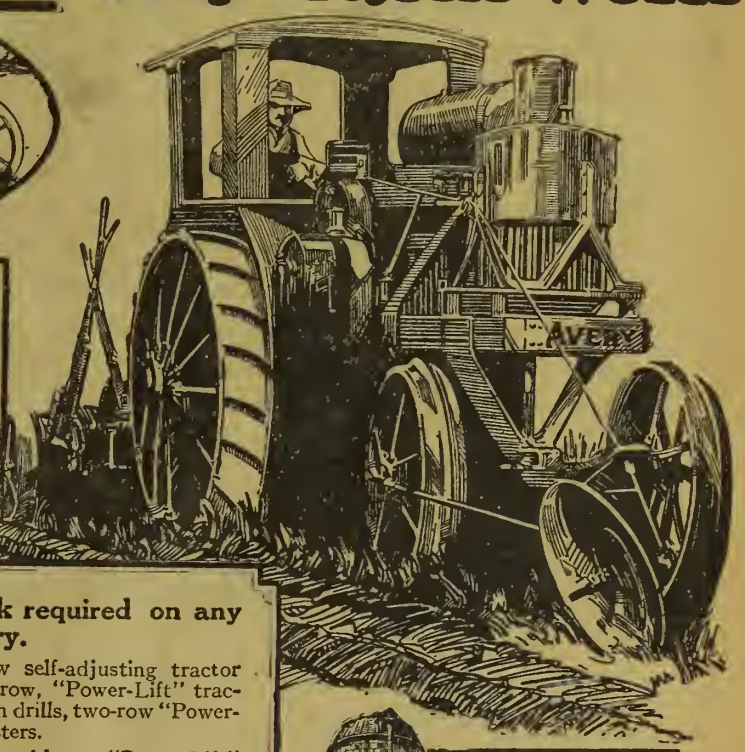
There is strong demand for lemons, especially in sections where influenza is epidemic. Twenty-five cars daily are going forward from this state. Good stock is bringing $5.00 to $5.50.

Shipments

Shipment of oranges from Southern California to date since November 1, 1919. Oranges, 5,229 cars; lemons, 977, total, 6,206. To same date last season, Oranges, 4,294; lemons, 1,538; total, 5,832. Central California: Oranges, 3,402; lemons, 154; total, 3,556. To same date last season: Oranges, 2,201; lemons, 187; total, 2,388. Northern California: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.



'Averyize' All Your Farm Work



YOU can do all the power work required on any size farm with Avery Machinery.

The Avery Line for 1920 includes a four-cylinder 14-28 H. P. tractor in addition to the previous 8-16, 12-25, 18-36, 25-50 and 40-80 H. P. sizes.

—A new six-cylinder small tractor.

—A six-cylinder two-row motor cultivator, a new four-cylinder one-row motor cultivator.

—A new self-adjusting tractor disc harrow, "Power-Lift" tractor, grain drills, two-row "Power-Lift" listers.

—Light and heavy "Power-Lift" moldboard and disc plows for any size tractor.

—A complete line of roller bearing threshers, and

—A roller bearing silo filler.

It Pays to "AVERYIZE"

Avery machines are built simple—can be operated without previous experience.
Avery prices are based upon large quantity production and the low selling cost of a complete line.
When you get an Avery you are assured of prompt and permanent service—backed by an organization with three large factories, many branches and satisfied customers in every State in the Union and 63 Foreign Countries.

AVERY

Motor Farming, Threshing and Road Building Machinery

Your hens can't eat color —they want feed!

Your hens don't care about the color of their feed—why should you? *They* want feed that is good—and *you* want feed that is good for them.

Color in itself is a mighty poor guide-post in buying feed. Why? Because the color of your feed has absolutely nothing to do with its feeding value. It may be light or it may be dark and yet not vary one-tenth of one per cent, in actual feeding value.

Feed for your hens should be bought on its chemical analysis—on its *actual* feeding value—not on its color or texture. This fact has been demonstrated time and again—there's no qusetion about it!

Take SURELAY, for example. It may vary in color from time to time. But it *never* varies in chemical content—in net feeding value. It contains at least a dozen ingredients balanced and blended according to a formula that has stood the test of time. Our daily laboratory tests (something the hand-mixer cannot have) assure *absolute uniformity* at all times.

SURELAY is proud of the things that go into its making. Long before the present feed law became effective, the exact analysis of SURELAY was printed on the back of every sack. Today, as always, you *know* what you're buying when you buy SURELAY. You know it is a top-grade, *uniform* feed that will make your hens pay by making them lay.

If you haven't seen the new edition of our booklet, "Makes Hens Happy," we'll be glad to send you a copy. Don't bother to write a letter—simply fill in the coupon below and mail today!

Gentlemen: Please send me, without obligation, your booklet, "Makes Hens Happy."

Name _____ Address _____

Feeding Value *vs.* Color

By GEORGE R. MCLEOD
Agricultural Department
Sperry Flour Co.

THE criticism of least consequence that can be made regarding a proprietary feed is color. Commencing with corn, which is the king of all feeds, there is no difference in the feeding value of either yellow, white or mixed corn; there is no difference in the feeding value of white, gray or red oats; there is no difference in the feeding value of white or red wheat. Common six-row barley (grown for many years in California) hulls white, while Portuguese and other bearded varieties of barley generally hull blue. But—there is no difference in feeding value!

Proprietary feeds cannot be manufactured in an economical way if color is strictly adhered to. A change in the manufacture of different colored corns, different colored wheats, different colored sorghums or different colored meals shows a change in the color of the by-products without a change in feeding value.

Why Color Means Nothing

The meat meals that are added for animal protein are often quite different in granulation, although there is no difference in the feeding value. A coarse granulation of meat meals does not have a tendency to darken, while a fine granulation of the same feeding value does darken a feed mixture very materially. This is also true of oilcake meals. The highest grade of oilcake meals obtainable varies from a light yellow to a very dark brown, and if these meals are mixed in the granular state they do not darken feeds nearly as much as if they are finely ground; and either highly concentrated meat meals or vegetable meals should be finely ground in order to mix thoroughly. The same is true of charcoal. In the granular state charcoal does not darken to any extent, but a very small proportion of finely ground charcoal has a tendency to darken a very large percentage of lighter feeds.

Color has nothing to do with the amount of moisture in a feed, which is a total loss; it has nothing to do with the ash in a feed, only a small part of which is assimilated; it has nothing to do with the amount of fibre in a feed, a part of which is digestible, but the cost of digesting and assimilating cuts down the net feeding value materially. Proteins, fats, carbohydrates—the substances that go to make up the net feeding value of any proprietary feed—are found in as large quantities in the gray or brown feeds as in lighter colored feeds.

Many Feeders Deceived by Color

A great many California feeders in the past have purchased feed on color and many of them still have the idea that they can tell the quality of a feed by looking at it. This is a good deal like the old saying that people purchase shoes to suit their eyes rather than to suit their feet.

If the value of a feed could be ascertained by looking at it, manufacturers would be compelled to sell their feeds on a color card basis rather than on an analysis. As a matter of fact, color is only camouflage and many people have been deceived as to the real value of feed by its color.

Oakland

OAKLAND OWNERS REPORT RETURNS OF FROM
18 TO 25 MILES PER GALLON OF GASOLINE
AND FROM 8,000 TO 12,000 MILES ON TIRES

THIS NEW OAKLAND SENSIBLE SIX FOUR DOOR SEDAN IS POWERED WITH THE FAMOUS 44-HORSEPOWER, OVERHEAD-VALVE OAKLAND ENGINE

OAKLAND
SENSIBLE SIX

ONE thing, above all others, singles out this new Oakland Sensible Six four door Sedan for especial consideration—that is its pronounced and unrivaled value. It is a car embodying all the comfort and reliability that ample size and sound construction can give. It is a car mechanically so efficient that, under all conditions, it delivers the maximum of service at the minimum of cost. It is a car so well and completely appointed that every essential convenience is included in its standard equipment. Yet the purchase price of this Oakland Sensible Six four door Sedan is relatively very low. The moderate investment it represents, and the fine and spirited character of the car's performance, combine in this Oakland to a value as conspicuous in the present market as it is unusual.

MODEL 34-C: TOURING CAR, $1165; ROADSTER, $1165; FOUR DOOR SEDAN, $1825; COUPE, $1825. F. O. B. PONTIAC, MICH ADDITIONAL FOR WIRE WHEEL EQUIPMENT, $85

California Cultivator

Vol. LIV, No. 6 Los Angeles, February 7, 1920 One Dollar Yearly

Sulphur Fumigation for Grape Mealybug

By R. L. Nougaret of California State Department of Agriculture

The Cultivator quoted last week from an article written some years ago by R. L. Nougaret, at that time connected with the United States department of agriculure, giving life hisory of the pest which has since deveioped into one of the grape growers' most perplexing. That article appeared in the Monthly Bulletin of September, 1918. During his connection with the department Mr. Nougaret continued his investigations of this pest. Some months ago Director Hecke secured his services and he is now in charge of the office of viticulture for the California department of agriculture. Mr. Nougaret has prepared for publication in the Monthly Bulletin of the department a statement of methods of controlling this pest, with practical everyday hints for their application. This article has the approval of Dr. L. O. Howard of the United States department of agriculture. Knowing its great yaiue to grape growers and that to be of any help in saving the coming season's crop it must be in their hands at once, we made urgent request of Director Hecke for the priviiege of using in this week's Cultivator. This has been granted and advance proof sheets supplied from which we give the following.—Edit.

THIS method of fumigation by means of sulphur fumes produced by burning sulphur directly under the tent was worked out by the writer when formerly engaged in grape insect investigations for the bureau of entomology of the United States department of agriculture, to whom credit for this work should be given.

It is pecuiiarly adapted to conditions pertaining to this species in relation to vineyards and is a very effective control when applied to vines in the vineyard. It is endorsed by the said bureau for this purpose. It cannot be used for disinfecting rooted vines of nursery stock and is not advocated for any other purpose than that related in this paper. Rules as formulated should be strictly observed so as to cause no injury to the vines.

This species of mealybug has different life history when the grape is the host than when other plants and fruits act as such. On grape it has two distinct broods which do not overlap as when the same species lives on citrus and pear. One brood, the first of the year, hatches in June and is the progeny of the overwintering larvae; the other, the second brood of the year, hatches during September and October. After hatching the larvae remain in the ovisac until the following spring. This is the period of hibernation, or overwintering time, during which there are only larvae and no eggs, these having hatched in the fall. Therefore, it is only necessary to conduct the fumigation with the object of destroying the larvae without taking the eggs into consideration. This facilitates considerably the results to be obtained, as in almost all cases of control it is more difficult to destroy eggs than to kill insects.

Warning

Too much emphasis cannot be laid uopn the fact that sulphur fumes are exceedingly injurious to plant life. In this connection a few don'ts to serve as a reminder may avert most serious damage through inadvertence and carelessness.

Don't fumigate with sulphur vines in an active growing state. It is only when in a dormant state that this can be done, with certain reservations, and cause no injury.

Don't fumigate with sulphur during the daytime. At night the temperature is lower (a most important feature), and darkness favors conditions of safety for the vine.

Don't fail to watch the thermometers during fumigation. There is a maximum temperature which must not be surpassed.

Don't fail to cover the burning sulphur with the distributing cover. An even distribution of the sulphur fumes throughout the tent is most essential.

Don't fail to use one sulphur pan and one distributing cover for every two vines.

Don't use sulphur which burns slowly. A rapid production of fumes in a short period of time is more effective in killing the mealybug, and less injurious to the vine, because the exposure is short and the fumes more penetrating on account of a greater volume of fumes being produced in a given time.

Basic Principles

Upon burning the sulphur rapidly depends the range of sufficient degrees of heat to be gained; a maximum temperature attained during the exposure, which insures safety in the operation; an exposure of short duration.

Factors in Applying

Kinds of sulphur used in order to produce a rapid combustion.

Ranges of degrees of temperature gained.

Difference between the initial temperature at the start and the maximum degree attained.

Exposure—Period of time during which the infested vine is subjected to the action of the sulphur fumes.

Maximum safe temperature—One hundred four degrees Fahrenheit. Not to be exceeded.

The exact volume or space encompassed by the tent sheet when placed over the vines, and the exact weight of the sulphur for a given space or volume, are factors which need not be considered in the performance of this method.

Equipment

Tent—A sheet of any material closely enough woven to prevent the fumes from passing through it can answer the purpose. Part of an old citrus fumigating tent is excellent. It must be long enough and wide enough so that when the vines to be fumigated (two, four or six in number according to how near the vines are in a row and the facility with which the tent can be handled) are covered, the tent touches the ground on all sides. There should also be a width of one and one-half feet of tent cloth to lay flat on the surface of the ground in order that there be a very close contact of the tent with the soil to prevent the escape of fumes. At each end of the tent a place should be provided for inserting the thermometer. This is done by fastening No. 5 canvas eyelets to the tent sheet so located as to be on top of the vine at each end of those to be fumigated when the sheet has been placed over the vines. The eyelet is fastened to the sheet by making a hole through which is inserted the funnel shaped part of the eyelet, the flange resting on the upper surface of the sheet. The ring is then passed over the funnel part and pressed tightly up against the underside of the sheet and securely kept in place by soldering, instead of riveting back that portion of the eyelet funnel shaped to tighten the ring against the sheet and keep it in place and make a flat eyelet. This funnel shaped part is not deformed but left in that shape so that a thermometer can be inserted through it and kept securely in place by means of a rubber cork which makes a tight joint opposing the escape of fumes.

Sulphur pan—For this a long handled frying pan ten inches in diameter, with a cover to fit, can be used. For suiphur wicks, a convenient way of holding them in place is to spike them on a sharp iron pin which is afterwards placed in position on supports of the sulphur pan in such a way that the lower end of the wicks rests inside and on the bottom of the pan. The supports are strips of iron six inches long riveted on the outside of the pan, and so shaped as to permit a cover to be placed on the pan when it is desirable to smother the flame of the burning melted sulphur which drips from the wicks at the end of an operation. In this way the excess sulphur is kept over for the next operation and serves to ignite the new lot of wicks.

Distributing cover—A round piece of sheet iron 18 inches in diameter supported on three or four legs, high enough to span the sulphur pan and low enough to prevent the fumes and heat of the burning sulphur coming in too direct contact with the vine. This is for the purpose of causing the fumes to spread out evenly throughout the whole space under the tent.

Sulphur—A form of refined sulphur which burns rapidly should be used in preference to one which burns slowly. Though costing considerably more than other kinds of sulphur, the commercial sulphur wick such as those used in sulphuring wine casks gives the best results. Each wick weighs practically the same, therefore a certain number represents a certain weight. The powdered and lump refined sulphur can be measured with a cup or other container correctly enough for the quantity of sulphur required for each pan.

Modus Operandi

The time of the year to fumigate is when the grape vines are dormant. This should be no sooner than late December, during January, and no later than early February. During this period of the winter season the night temperature is low and there is no movement of sap. Later when the buds are swollen and on the point of bursting open, the sulphur fumes and accompanying heat are likely to cause injury. Frosts in November will advance the time when fumigation can be done with safety. Fumigate at night only.

To insure an even distribution of the fumes and heat under the tent, one set of suiphur pan and distributing cover should be placed between every two vines.

Vines six feet apart in a row can be fumigated four or more at a time. Place the distributing cover in the right position between each pair of vines, then cover the vines by raising one edge of the tent sheet high enough so that the longitudinal center of the sheet is about even and in line with the top of the vines, then drop the sheet to the ground on the opposite side of the vines. This places the tent over the vines without having to drag the sheet over the canes.

It is preferable to fumigate vines before they are pruned, because the canes provide a better frame for the tent and there is less risk of tearing the sheet than when the latter is drawn over the sharp ends of fruit spurs of pruned vines and damage by breaking off fruit spurs is avoided. Precaution should be taken so that the sheet makes a good contact with the ground to prevent the escape of the sulphur fumes. If the ground has been batted down and made hard by rains, it is well to plow several furrows on each side of the row of vines so that the sheet and soil can make a good contact. Place the thermometers in the openings provided in the sheet for that purpose.

Place the sulphur in the pan, light it and slip the pan under one side of the tent into the position it must occupy under the distributing cover. Make note of the time at starting the fumigation and of the initial temperature; watch the rise of temperature. If the range in degrees gained is not a good average, at least 18, give a little more time to the exposure. If the range in degrees gained is enough, and the maximum temperature 70 to 75 degrees Fahrenheit, give just the required exposure of 15 minutes. Should the gain in temperature be very rapid and the maximum degree of safety, 104 Fahrenheit, be attained before an exposure of 15 minutes, remove the tent immediately from off the vines.

Safety Precautions

The mealybug is killed and the vine uninjured if fumigation is done at night, during 15 minutes exposure to sulphur fumes.

Burning six ounces of refined lump sulphur or five ounces of sulphur wicks per 100 cubic feet (these figures are given only as guide for approximate quantities to be used).

For a minimum of a range of 18 degrees gained during the first six minutes; maximum temperature attained 70 degrees Fahrenheit; temperature slowly dropping during next nine minutes, total exposure 15 minutes.

For a maximum of a range of 60

(Continued on Page 198)

Agricultural News Notes of the Pacific Coast

Northern California

The Sonoma County farm bureau is laying plans for a county fair to be held in the fall.

Mendocino County farm bureaus are considering uniting with the state and national federation.

Cattle in the Bald Hills section of Shasta County are reported suffering from lack of feed.

The annual meeting of the Sonoma County farm bureau will be held at Santa Rosa on February 25.

Farm Adviser Merrill of Sonoma County is making a survey of the dairy industry of the county.

The California Cattlemen's Association is making plans to ship cattle to other states for green range.

The entire 14,000 acres to be irrigated by extensions to the Sutter-Butte canal will be planted to rice.

Many sections of the state are calling for an extra session of the legislature to consider the Japanese question.

The farm adviser of Humboldt County is securing data from dairymen as to rations and methods of feeding dairy cattle.

The farm bureau of the Durham Land Colony is investigating plans for a cold storage plant to be established in the colony.

The Placerville Fruit Growers Association has just declared a dividend of over $15,000. Old directors were reelected for another year.

Tractor dealers of Chico, Butte County, combined last Saturday in a field demonstration on the Patrick ranch between Durham and Chico.

A meeting of the California Certified Seed rowers was held at Stockton January 30 and 31. The second day was devoted to field inspection.

The A. W. Morris & Sons ranch at Woodland, Yolo County, has been sold to the Conaway Ranch Company. The ranch contains 1,280 acres.

An election will be held February 21 to decide on establishment of the Glenn-Colusa irrigation district. If formed the district will include 102,000 acres.

The rice acreage in the Sacramento Valley will be increased from 140,000 acres to 175,000 this year, according to estimates made by the Pacific Rice Growers Association.

Jesse R. Hall has been appointed supervisor of the Shasta national forest to succeed L. H. Sloan. Mr. Sloan has served in both the Santa Barbara and Klamath national forests.

The big Virden packing plant at Sacramento has been enabled to proceed with its work of establishing the $5,000,000 industry by the commissioner of corporations releasing $2,000,000 of capital stock which had been subscribed for.

The Fourteen Counties Association which worked so hard to get the legislature and the governor to pass and approve bill appropriating $3,000,000 to flood control work now finds a discouraging situation because of Japanese farmers stepping in and taking control of the reclaimed lands.

The farm home department of the Shasta County farm bureau held its annual meeting at Redding, January 24, electing officers for the coming year. Chairman, Mrs. W. H. Tormey, Anderson; vice chairman, Mrs. Parker Talbot, Redding; secretary-treasurer, Mrs. Grover E. Oaks, Clear Creek.

Central California

Merced hopes to have established a packing plant for figs.

Watsonville high school boys are organizing for a pig raising contest.

The Madera irrigation district is being organized. A. L. Cowell is managing the organization work.

Stanislaus County farmers are opposing the sale of the great Buhach Ranch to a Japanese corporation.

The cotton growers of the San Joaquin Valley gathered recently at Fresno to the number of 150. It is estimated that 30,000 acres will be planted in the valley this season.

Miller and Lux will dispose of some 30,000 acres of land in Madera County. It is said that this sale is made because of large sums collected by state and federal governments as inheritance taxes from the Miller heirs.

February meetings of Kern County farm bureau: Weed Patch, 2; Kern Delta, 4; McFarland, 6; Delano, 9; Wasco, 11; Rio Bravo, 12; Edison-Fairfax, 13; Mountain View, 16; Pond, 18; Rosedale, 20; Inyo-Kern, 23; Shafter, 25; Arvin, 27; board of directors, 28.

The Fruit Growers Association of Cutler, Tulare County, at its recent annual meeting elected J. P. Bernard, president; W. H. Edwards, vice president; G. R. Goldman, secretary; George Smith and J. W. McPherson, directors. A very prosperous year was reported.

The December butter fat payroll at Tulare totalled $200,062 for the creameries, making an average of over $200,000 per month for the last six months of 1919. With the new milk powder factory in full operation another $100,000 per month is expected to be added to the amount, according to the factory manager.

Members of the Tulare board of trade and Tulare farm center will cooperate in a campaign against the shipment of manure from that section. Chief effort will be directed toward having land owners have clauses in leases to tenants providing that all fertilizer produced on the land should be kept there and spread on the fields.

Agricultural products shipped from Tulare County last year had a total value of $25,275,326, according to the annual report of A. E. Miot, secretary of the county board of trade. Chief items were: Citrus fruits, $5,196,226; vineyard, $5,247,500; deciduous fruits, $3,185,800; livestock, $4,877,700; dairy, $3,050,000; poultry, $1,000,000; wheat and barley, $1,263,000.

Judge N. E. Luce of Los Angeles and Professor J. E. Dougherty of the university farm were the chief speakers at the all day annual meeting of the Tulare Cooperative Poultry Association on February 3. Last year the association did a total valume of business amounting to $280,000, an increase over 1918 of $50,000. The operating expense for the year was $10,700, less than four per cent of the volume of business.

Members of the fair committee of the Tulare board of trade are working on plans for their 1920 stock show which follows the state fair at Sacramento on the new fair circuit. Inquiries already directed to the board of trade indicate that there will be from four to five times as many head of stock entered as in the first fair last year and the grounds and buildings will be greatly enlarged to accommodate exhibitors.

Southern California

Orange County farm bureau will hold its annual picnic on May Day.

Spinach shipping has ended in the Coachella Valley after a most successful season.

Brawley is now sending out heavy shipments of lettuce, spinach and mixed vegetables.

Riverside County expects to plant 2,000 acres of cotton, principally in the Palo Verde Valley.

Palo Verde Valley, Riverside County, has promise of a new cotton seed oil mill and feeding station.

The acreage planted to onions in the Coachella Valley is reported four times larger than ever before.

Imperial Valley officials are giving warning to children under 18 that they must not drive automobiles in that county.

Westmoreland ranchers are protesting against poor condition of roads which makes hauling to the railroads difficult.

Shipments of farm produce from Imperial Valley this year are said to be at least 200 per cent greater than last year.

Apple Valley farm center near Victorville, San Bernardino County, is taking steps to organize a fruit marketing association.

Eleven thousand acres of land in Imperial Valley are reported already signed up for the growing of Pima long staple cotton.

The Covina-Charter Oak center of the Los Angeles County farm bureau has elected Ben F. Thorpe president. Grant Chapman was elected secretary.

The Goodyear Rubber Company has announced that it will soon begin erection of cotton gins at Brawley, Calexico and either Imperial or El Centro.

At the recent annual meeting of the Arlington Poultry Association J. M. Davison was named representative to the Poultry Producers of Southern California.

The Citrus Belt Milch Goat Association will hold its next meeting at the Higgins ranch near San Gabriel, Los Angeles County. Date of the meeting February 21.

More than 90 per cent of the apricot acreage of the Hemet Valley of Riverside County is signed up with the California Prune & Apricot Growers Inc.

The Arlington Poultry Association at its recent annual meeting elected J. L. Edmiston, president; J. R. Roney, first vice president; H. K. Martin, second vice president; Murray Davison, secretary-treasurer.

Four cooperative canneries of Southern California located at Hemet, Ontario, Elsinore and Fallbrook have consolidated under the name of California Growers Association. Headquarters will be in Los Angeles.

The Farmers Club and the Parent Teachers Association of Little Lake, Riverside County, have consolidated under the name of Little Lake Farm Center. O. E. Kellner has been elected president; Mrs. C. E. Moyer, director; Mrs. H. O. Eggen, secretary-treasurer.

The California Prune and Apricot Growers Association will soon start erection of a great hollow tile packing house at Santa Paula, Ventura County. The association in that county is planning to pack much of its next season's crop in small cartons for retail trade.

The Coast and General

There is agitation in Oregon for laws to keep out the Japanese.

A Duroc-Jersey swine show was held at Salem, Oregon, February 4.

The Roosevelt reservoir is expected to overflow before the end of January.

Jackson County, Oregon, has appropriated $10,000 for the purchasc of a county fair site.

The Oregon Growers Cooperative Association has passed the 15,000 acre mark. It now has over 700 members.

The estimated onion acreage in Southwest Texas is about 12,000, the largest planting being in the Big Wells district.

A large delegation of Arizona cattle growers are attending the National Convention of Livestock Growers at Spokane this week.

Managers of state and county fairs recently met at the Oregon agricultural college and discussed dates for the Oregon circuit.

Farm bureau members of Lane County, Oregon, are arranging to import a number of cattle from the Island of Guernsey.

Growers of wheat in Washington, Oregon and Idaho are forming state associations with the idea of joining together into a pool to handle the wheat of the three states.

The Grange Warehouse Company has recently purchased its fortieth warehouse in Washington. This adjoins a concrete building owned by the company at Chehalis.

Apple shippers of Wenatchee, Washington, are confronted by a critical situation in the apple market because of the frozen fruit which has found its way into dealers hands.

Carl Erickson, near Phoenix, Arizona, reports a yield of 11 bales of 500 pounds each and 300 pounds over from seven acres of long staple cotton. This land has been in milo for two years and previous to that in alfalfa.

The Buckeye Canal Company of the Salt River Valley of Arizona is making extensive repairs on its water distributing system whereby they will add 5,000 acres to the land watered. The water is obtained direct from the Gila River.

The chamber of commerce of Phoenix, Arizona, through one of its members, is giving free trips to the short course held at the state college of agriculture, to nine boys and girls who have done especially good work in the boys and girls club work.

Throughout a good portion of the range district of Arizona there have been heavy snow falls that have made it somewhat uncomfortable for cattle, but few losses are expected to result Cold rains in the desert section have caused some suffering among the young lambs, but very little loss.

D. M. Green of the United States department of agriculture, expert poultryman, is stationed in the Salt River Valley and experimental work is beginning on a tract of land west of Glendale, which was originally operated as an ostrich experiment farm. It is expected that a tract of land will be secured nearer to Glendale which will be more favorable. There is great need of more experimental work in poultry feding, hatching, etc., as conditions are so much at variance with the conditions in other parts of the country.

A Feed Margin and Safety

By R. P. Royce

THROUGHOUT California, with very few exceptions, stockmen are facing one of the most serious feed shortages in the history of the state. In many sections the situation has become so critical that unless copious rains are shortly forthcoming the losses will be certain and heavy.

Aside from the hoped for rains, very little practical relief can be turned to account in the present crisis, and it is not with any intention of suggesting such relief, as is so sorely needed now, that this is written, but rather to use the present crisis to draw attention to preventing, in a measure, future recurrences.

During the past four years the stockmen have had to contend with short feed to a greater or less degree. Some years the shortage has been general, other years it has been of a more or less local character — but the losses have been severe in either case—and this in a state favored by feed conditions that are unsurpassed. Without any desire to preach, the writer is of the firm opinion that it is high time the livestock interests of this state set about to correct and solve the feed problem. It can be done.

As a working basis, the fact must be admitted that there is no more range in sight. With a growing population necessitating increased meat production, the real fundamental bedrock proposition is to make our available range carry more pounds of meat and carry the increase in safety.

Stockmen can rest assured that the few dry years they have experienced were not freaks. There will be other dry years. Knowing the hazard of a dry year, operating plans should always revolve about an anticipation that the next year will be dry. If such anticipation is provided for, that provision will constitute the best insurance the stockman can carry. No business can be safely operated without due regard to hazards and the successful man is the one who knows his hazards and makes the most practical plans for forestalling them. The biggest hazard that the stock raiser faces is a shortage of feed. His problem then is to increase his feed supply. Several methods are practical.

First of all, the average range has been carrying a peak load most of the time. A lot of men have figured that the way to make a range pay was to put on every hoof possible. As a result thousands of acres of range are not carrying as much today as ten, 15 or 25 years ago. They have been killed out by the short sighted policy of overstocking and not giving the native grasses an opportunity to reseed. There are many ranges in this state where, at moderate cost, water could be developed in sufficient quantities to make possible a considerable tonnage of hay for use as winter feed and in many cases the production of forage crops suitable for silage is entirely practical.

The use of silage as an adjunct to range operations is not general, but there can be slight doubt that sooner or later range men will turn to the silo for insurance through dry years. No doubt many men have looked upon the silo and the growing of silage crops as too expensive to be carried on on a large scale, but if silage is practical in small operations it should be practical in a larger way.

Since the beginning of the range business the great majority of cattle and sheep men have followed the theory that the way to beat the game was to stock the range to the limit and trust to luck and a kindly providence to see them through the periods of shortages. They have been good gamblers, as gamblers go; they figured on a certain loss, and expected to pull most of their stuff through in mighty thin condition, and for the most part those who operated along the above lines and "got by" rated their operations as successful. But has such practice been good business? Has it been profitable to run stock in good season only to lose the condition and thrift when short feed comes? Would it not be better business to take the losses caused by death and a heavy shrink in poundage and put that money into development of water, hay, silos and silage crops? Can the man with heavy investment in cattle or sheep afford to follow the old plan in vogue when cattle, sheep, land and labor were cheap? Can he afford not to adopt more modern practices made necessary to meet new conditions?

But some will say, "What is the sense of going to added expense—when maybe we won't need extra feed one year out of four?" The answer is—no man can really afford to take a chance on a three to one bet. That losses of that one year will cover, in many cases, the added investment. And the value of a reserve feed supply can hardly be estimated when needed. Here is a case in point, though not directly concerning the range man. The Butte City Ranch built a silo several years ago and filled it with corn. It so happened that feed was abundant each year after the silo was filled and the silo was never opened. There it stood for three years. Was that good business? Listen! This year feed was short; the cattle were losing weight every day—feed could only be bought at prohibitive prices. The silo was opened and around 200 tons of excellent and cheap feed was made available. That silo, idle for three years, was a life saver this year. Did it pay? Ask the owners!

Another feature of range management that must be given serious consideration is the problem of range improvement. There is no question but that the carrying capacity of hundreds and thousands of acres can be increased by the adoption of proven practices.

Primarily, range improvement hinges on whether or not the range is overstocked. A range on which the number of stock maintained is such that the herbage is eaten to the roots, can not be expected to improve or remain constant and each succeeding year under such practice the number of head carried must be reduced or expected to come through in poor condi-

(Continued on Page 223).

Demonstration Lemon Tree

By J. P. Englehart

One of California's pioneers in lemon growing is J. P. Englehart, one of those orchardists who lives with his trees. He soon discovered that trees, like human beings, have habits. In studying and encouraging or subduing these habits he has applied a system of pruning which has become known as the Englehart system. This has been described in former Cultivators. Here are a few of Mr. Englehart's recent observations.—Edit.

IN order to prove my theory of lemon tree pruning, based on heredity and the transmission of producing qualities in the wood composing the tree, I am growing demonstration trees from various buds, mostly Eureka lemons.

The so-called Englehart system of pruning has for its object the producing of uniformly good and plentiful fruit, which is found to be possible only by having the tree composed of close grained uniformly good bearing fruit wood and by eliminating all other kinds of wood, such as soft sucker sprouts and a peculiar white wood.

The type of tree obtained in this manner is somewhat of the nature of a thoroughbred, as it is originally bred, or later, pruned to become a top-notch bearer.

For many years I had observed that high grade fruit spurs were formed on wood that was originally obtained by growing a bud from an excellent bearing branch, composed of thin, dark wood of small compressed cells. If the original bud was taken from showy, watery, large celled wood, we failed in attaining our object.

My inference is that bud selection should be based on fruit wood selection, even if taken from trees that are record bearers in both quantity and quality. My four year old demonstration tree proves this. It was started from three buds of entirely different lemon wood texture. These were inserted upon an ordinary seed bed tree. They were respectively from sucker wood, from record fruit bearing wood and from a very common type of white wood which is threatening to replace desirable types of wood in many groves. (They were taken from a record bearer tree.)

The result is convincing. My tree consists of three large subdivisions, all of which differ in color and in the structure of the branches, leaves and fruit, exactly as the originals did.

Three Typical Eureka Lemon Branches

At left is branch of so-called white wood of which our idlers, or so-called shade trees, or non-bearers, are composed. Luxuriant foliage but little fruit are their charteristics.

Center branch is true fruit wood of which the entire tree should be composed in order to make it commercially highly profitable. Such trees are sturdy, even if somewhat small. They are record bearers in performance.

Branch at right is of sucker wood which may sometimes compose an entire tree. It bears fruit in small quantity.

Besides, the good fruit bud shows that it is dominant in this particular tree, as it has produced a vigorous mass of bearing branches, comprising nearly one-half of the tree. At the same time the recessive nature of the white wood and sucker in this tree are shown, especially of the former.

I am studying the intermingling of sap in this tree as affecting the branches reciprocally and believe we are on the eve of a great discovery in fruit tree genetics. Mendel's law is surely operative in our fruit trees.

I have grown a large numebr of so-called thoroughbred lemon trees, which have proved year after year to have quite marked characteristics and to be of the greatest value commercially. Such trees are started by inserting a bud of unmistakable record bearing fruit wood upon a certain type of seed bed tree, and have been found to breed true to the original branch, inheriting its qualities.

This system of lemon pruning is based not only on the phenomena of inheritance, but also uopn the study of the reciprocal action of the sap flowing in the various branches. A remarkable fact observed is that quantity, as well as quality, of fruit are found to be coexistent and dominant in the perfectly developed tree.

In fact, these two qualities become dominant and all other qualities recesslve by proper fruit wood selection in either starting the tree with a perfect bud, or, if not, then by proper wood selection in the pruning as the tree grows older.

I might say that the object of this method of pruning is the conserving or protecting of the good, original bud. In fact, of what use is bud selection if you do not protect and conserve the bud, as it unfolds in the making of the entire tree?

Cooperative Canning

THERE have been several cooperative canneries in California, and they have resulted in many a fruit grower getting full return for a crop which would otherwise have gone a begging. Unfortunately everyone of these has not been a complete success, though none has been a complete failure. But business management is succeeding and we believe that today every cannery operating upon a cooperative basis is successfully managed. Heretofore these concerns have not been large, but the California Cooperative Canneries, now erecting an enlargement to its plant in San Jose, has gained a success greater than most of the others. A recent issue of the San Jose Mercury comments editorially on the advantage which has been secured by growers because of this cannery:

"It would be of great interest to the fruit growers of this valley if actual figures could be compiled showing the increase of values of their products, the direct result of the establishment of the California Cooperative Canneries and the erection of the big plant on Taylor Street. Of course it is impossible to compile such statistics, but it is not difficult to see that this increase in values runs to very large figures.

"The opinions of the leading growers of the valley, taken with information available as to prices paid for similar products in other sections of the state, give a very good basis on which to make estimates. As an example, apricots were purchased by commercial canners in other sections of the state at prices ranging from $50 to $75 per ton. The average price paid by the leading canneries in the Santa Clara Valley was $100 per ton and this price was exceeded in some few cases by smaller canneries. The buying in this valley was delayed until the fruit of other sections of the state had been pretty well taken up, and by that time the growers were familiar with the plans and the capacity of the cooperative plant and its influence was being felt materially. Conservative growers not members of the local cooperative organization have freely stated that the establishment of the Cooperative Canneries added not less than $25 per ton to the canning apricots of the Santa Clara Valley. This on a basis of 10,000 tons, which is a close estimate of the total tonnage of apricots sold the canneries during the season of 1919, would make a total increase in the value of the canning apricots of approximately $250,000 for which the California Cooperative Canneries should receive credit.

"On the 1,600 tons delivered by members of the Santa Clara Valley Growers Association to the California Cooperative Canneries this increase will be over $40 a ton, as the average price returned by the cannery on all grades of fruit will be $115 per ton. This means that the Cooperative Canneries will have paid to its growers on apricots delivered during the season of 1919 canning profits to the extent of $64,000.

"It is to be noted at this point that the average price paid above covered all grades of apricots delivered and as is frequently the case in the early history of a cooperative cannery a considerable quantity of fruit was delivered to the local institution of quality below that accepted by commercial canneries at contract values. This lower grade fruit, of course, reduces the average per ton of the cooperative plant and makes direct comparison with commercial canners' prices unfair to the growers' plant. On the deliveries of the best quality of apricots such as the canneries require from their growers the cooperative returns will range from $125 to $140 per ton. These figures taken in connection with the conditions surrounding the operation of the new plant at a time when the buildings were still in course of construction, the personnel was new, in many cases made up of unskilled and inexperienced labor, gives some idea of the possibilities of profits for the growers in the operation of their own plant packing their own fruit.

"These facts have become so well known to the apricot growers of the valley that the possible capacity of the big plant, in the north end of the city, for apricots has practically all been taken up and only a very small additional acreage can be accepted."

FRENCH PRUNE IN CALIFORNIA

THE Journal of Heredity recently had an article written by A. D. Shamel of Riverside, giving history and method of development of the Coates 1418 French prune. The introduction of the article contains so much of interest that we quote liberally:

"The French prune, Prunus domestica, commonly called the petite prune d'Agen or little French prune, was introduced into California in 1856 by Louis Pellier, a nurseryman of San Jose, who brought the scions from Ville Neuve d'Agen, France, from which place the variety takes its name. The commercial development of this prune in California started about 1880. In 1918, according to the California state commission of horticulture, there were 100,721 acres of prune trees in bearing and 34,690 acres of young trees not in bearing. The production amounted to 39,127 tons with an approximate valuation of $5,500,000. The Santa Clara Valley is the center of greatest production, having about 60,500 acres of bearing prune trees. In 1919 the very heavy crops, together with the high prices being paid for prunes, seem likely to establish a high record both for the amount and value of the crop.

"During recent years the prune industry has developed extensively in the Pacific Northwest, particularly in the states of Oregon, Washington and Idaho. Formerly the growth of the prune industry was slow in these districts on account of difficulties in drying the fruits under natural climatic conditions. Recently, the drying has been done successfully under controlled conditions with hot, dry air in evaporators. This development seems likely to lead to an extensive culture of the prune in the Northwest.

"The Prune d'Agen variety, most generally grown in California, is particularly well adapted for dried prune production on account of the rich, aromatic flavor of its fruits, the dense, fine texture of the flesh, which gives the cured fruits tenderness both when used as a confection and when slightly cooked, and the smallness of the pits, together with their thinness and smoothness. The dried fruits frequently contain more than 50 per cent of fruit sugars. Correlated with this sugar content is a high degree of spicy prune flavor. The color of the fruits of this variety is a royal purple, which is an important factor in the successful marketing of the dried prune. The delicious, melting flesh separates easily from the small flat pit.

"The trees of this variety are heavy bearers under normal conditions. Some fruit is usually borne the third year after planting. From the fifth year on, the trees may be expected to produce commercial crops. From 200 to 300 pounds are considered to be a satisfactory yield for a full bearing French prune tree. However, 600 and even 800 pounds have been produced, and a six year old tree at Visalia, is said to have borne 1,102 pounds of fruit in one season.

"The tendency to heavy bearing is frequently correlated with small size of fruits, particularly when the crops are not thinned at the proper time. If too much bearing wood is grown, the fruits are likely to be too small for

(Continued on Page 198)

ESSEX MOTORS DETROIT USA

Essex Sets World's Long Distance Endurance Mark

3037 Miles in 50 Hours Proved Its Reliability

In its official test of 50 hours to prove endurance, Essex has established its claim as the dominant new type light car. Who ever before regarded a car of its type in the light of such proved performance and endurance? Only specially built racers and a few of the larger, costlier cars have been considered capable of such a test. Surely light weight cars have not been associated with such reliability as Essex has shown.

Proves Essex Economy

This test gives to Essex proof of the greatest factor in motor car economy. Light cars are notable principally for their economy in saving of gasoline, oil and tires. These qualities Essex has revealed from the first. But real economy must also include freedom from repairs and mechanical attention—all costly items.

So what greater proof of Essex economy could be asked than its new world endurance mark.

5869 Miles in 94 Hours 22 Minutes Driving Time

These tests were not made to establish speed records. Two trials were made before the 50-hour run was completed. So, in all, the Essex went 5,869 miles in 94 hours, 22 minutes driving time, averaging more than a mile a minute. Sleet stopped one, after 27 hours, 58 minutes, and 1790 miles. Snow halted a second, three days later, after 16 hours 25 minutes and 1042 miles. The third, begun the next day, went the full 50 hours. These tests were made under American Automobile Association observation on the Cincinnati Speedway.

Think what they mean. The average car is driven little more than 5,000 miles in a season. The average driving speed is probably 25 miles an hour. The Essex went more than a mile a minute for 5,869 miles.

You might expect that a car of its weight would require frequent mechanical attention. But there was no need for that in the Essex.

Doesn't It Settle the Light Car Question?

Essex now adds to its light car qualities the advantage of endurance and reliability. It brings costly car distinction, beauty and fineness to the light weight, moderate price class. Essex cars appeal to pride, and that is why owners speak of them as they do.

Individual owners would never ask as much of a car as did this 50-hour test.

It showed how much more could be expected of an Essex than any one would demand of it.

Every Essex delivered has resulted in an increased demand. Sales passed $35,000,000 in 11 months—a new record.

This latest proof will decide thousands who have only waited for just such evidence that Essex would stand up. All buyers cannot possibly be served. Now is the time to make your reservation.

Copyright 1920, by The Goodyear Tire & Rubber Co.

"IT would be impossible for us to handle our present milk route except with a pneumatic-tired truck. Our Goodyear Cord Tires have delivered mileages up to 13,500 to date over bad gravel, rocks and chuck holes. With them we serve more farmers than we could with the slow solid tires."—Harry E. Hughes, Dairy Farmer and Truckman, Hughes, Ohio

THIS statement describes hauling conditions such as many farmers find can be counteracted most effectively with the perfected pneumatic truck tire.

Not only does the pneumatic-shod truck, as compared with the solid-tired unit, average a better rate of travel over country routes, without necessarily reaching a high maximum speed, but it does so quite smoothly.

Rural users thus note that hauling on pneumatics adds to a saving of time and brawn important protection of equipment and loads, shrinkable, perishable and breakable.

They particularly note the effect of Goodyear Cord construction, developed during recent years, which makes possible pneumatic-tire mileages comparing very favorably with those of solid tires.

In addition to reporting that pneumatic-tired trucks pave the way for the general motorization of farm work, they list mileages of Goodyear Cord Tires, on trucks, as ranging from 15,000 to past 40,000 when given proper care.

Accurate information furnished by farmers and other rural haulers, showing how they improve their methods and incomes with pneumatic-tired trucks, can be obtained by writing to The Goodyear Tire & Rubber Company, at Akron, Ohio.

GOODYEAR
CORD TIRES

The DEALER says=

"the GIANT mark protects you from imitations"

"It pays me to give my customers what they ask for," says the retailer who knows what's what. "When they ask for 'Giant Powders' I give them GIANT Powders—the real Giant, made by The Giant Powder Co., Con. I don't tell them that 'I have the same thing, only under another brand name,' because it is not true.

"The name 'Giant' on a case or a stick of powder is evidence that the powder is made by the company that originated Giant Powders. Remember this: You can't get Giant results when you use ordinary dynamites that look like Giant but aren't marked Giant."

Look into the new, money-saving methods of clearing land, blasting tree beds, ditches, boulders, etc. They are all described in our up-to-the-minute book, "Better Farming with Giant Farm Powders." A post card will bring it by the first mail.

Twenty Acres of Berries

By Ernest Braunton

TWO miles southwest of the San Gabriel Mission in Los Angeles County lies the 40 acre Boos ranch where 20 acres of berries are being planted for special restaurant use. Ground has been prepared and stock ordered, or is now on the ranch, for five acres of blackberries, five of raspberries, two and a half of loganberries, and six of strawberries. Supperintendent Baldwin, a California farmer of long and varied experience in this line of work, says stock is very scarce in this state and much of it is coming from farther east.

The blackberries will be set on a warm southern slope of about 20 degrees, a side hill plantation on contour lines so that irrigation will not prove a problem. The rows will be ten feet apart and the plants eight feet apart in the rows. This will allow of heavy permanent irrigation ditches on the upper side of every row. The varieties used will be rampant growers, the Himalaya often making canes of 40 feet in a season. Half of the plot will be in Corey's Thornless, which is really a thornless Mammoth. This variety has run to 20 feet in a summer. Mr. Baldwin is much in favor of thornless canes as he says the biggest berries grow amid the thickest growths and pickers will not risk injury from thorns to get them. The plants will be set out at once and immediately irrigated and for every three weeks thereafter, to produce a quick growth of canes. Of course, in fruiting season they may get water once a week. Posts of redwood three by four inches will be set 16 to 20 feet apart in the rows and five feet high. On top of these will be placed a crosspiece four feet long, so the trellis will be T-shaped. There will be four wires strung on top and two wires on the posts below.

Raspberries.

In the five acres of raspberries one-half will be Cuthbert and one-half St. Regis. The reason for so planting is that Cuthbert yields but few fruits the first year while St. Regis bears a good crop. A half-acre will also be set to the eastern Black Cap. The latter will be in rows six feet apart, plants three feet apart in the row. The others will be set four feet in the rows and rows six feet apart. Loganberries will occupy two and a half acres and may be planted eight by eight feet or ten by ten.

Strawberries

The strawberries will consist of an acre and three-fourths each of Klondyke, Brandywine and Lady Cornella and three-fourths of an acre of the Carolina, an unnamed variety received from North Carolina producing enormous crops during the past year, in appearance resembling the Banner. As the latter stock is scarce the plants will be set three by three feet, the runners kept in the rows one way and cut with hoes the other. The irrigation ditches between the rows will also prevent a matting sidewise. This will insure a rapid filling of the rows. Other varieties will be in rows three feet or 42 inches apart and plants one foot apart. Barnyard and poultry manure has been worked into the soil and experiments will be made with commercial brands and nitrate of soda as much of the latter is used on vegetables on the same ranch.

California Lettuce

IT would seem that nearly every county in California is distinguished for something above any other spot, and it appears that two counties beat the world on lettuce. Imperial County ships more than any other like area, and Los Angeles County ships more continuously throughout the year than any other spot, there being a small acreage equally available in Orange County. Aside from these districts there is considerable sent from the Coachella Valley, Riverside County, and from the Salt River Valley, Arizona.

But the Gardena-Moneta section, a few miles from Los Angeles, ships lettuce every month in the year. In company with F. R. McQuaid, local manager for the California Vegetable Union, the writer last week visited several large fields. One ranch of 93 acres belongs to C. G. Pursche, and 20 acres are now just coming into market as another field is finished. Mr. Pursche told us there was no time in the year that he did not have ten to 15 crates of marketable lettuce on hand, and there is now a total of about 500 acres in the Gardena-Moneta district, with about 150 acres at Lomita, nearer the coast and San Pedro.

The crop now being harvested is from seed sown in October. The shortest time from seed time to harvest is from seed sown in June, the lettuce being cut in August, a lapse of 56 days. The longest growing season is from November seeding, harvested about the first of April. Lettuce seed is giving the growers some concern as it is now selling at $7.50 a pound, while just a year ago it sold for $1.50. But as Mr. Pursche said: "Why should we worry? Last season, from December 15 to May 1, I took more than $13,000 worth of produce from this ranch, as Mr. McQuaid will testify, for he shipped the stuff and the return checks passed through his hands." Nearly the entire acreage is set to Los Angeles Market, though a little Iceberg is planted for local midsummer trade. The seeds are planted in double rows ten to 12 inches between the companion rows, from the middle of one pair to the middle of the next being 32 to 34 inches, irrigation ditches alternating with the double rows. Plants must be thinned in the rows to not less than one foot apart, for air must circulate freely under the plants or the lower leaves will rot.

Rotation of crops is a universal practice with all the vegetable growers, and there is no time hay, either barley or alfalfa, may not be found on every ranch of 80 or more acres. On the ranch noted there are 25 acres in cauliflower, ten in cabbage, including a patch in purple cabbage. This last is not much in demand by Americans but Europeans and Jews use it much as a relish, not as they use the more common cabbages. There is a slightly increasing demand for Savoy cabbage, for all will concede it has the finest flavor of all. Yet it is the European who buys it and encourages its extension for in Europe it has been the leading variety for home use for centuries. Much of the young cauliflower in this section has been at a standstill for some time, due to two causes—lack of rain and warm weather.

Aphids are very bad except where plants have lately been sprayed, a 40 per cent nicotine sulphate being the base used for annihilating them. The day after this visit it rained and the weather plays an important part in the welfare of aphids, heavy rains washing many away, especially the tender forms, and in hard, continuous rain those washed off starve to death for they can live but a short time without food. Cold weather also retards the increase and damp weather favors the entomogenous fungi so that sometimes 25 per cent of the aphids are killed by it.—E. B.

CALIFORNIA CORN

It is the belief of leading seedsmen that the highest notch has not been cut in corn production in California. The solution of the problem is believed to lie in the trial of many varieties of high quality seed corn from various parts of our country where corn is a decided success. One of the leading seed houses in the south end of the state is now having quite a list of the best Eastern varieties tried in several sections ranging from San Diego up to the San Joaquin Valley. It is hoped thereby not only to find new kinds adapted to California but to determine if one variety will do well in all sections of the south half of the state, or whether we must use several varieties to meet climatic differences.—E. B.

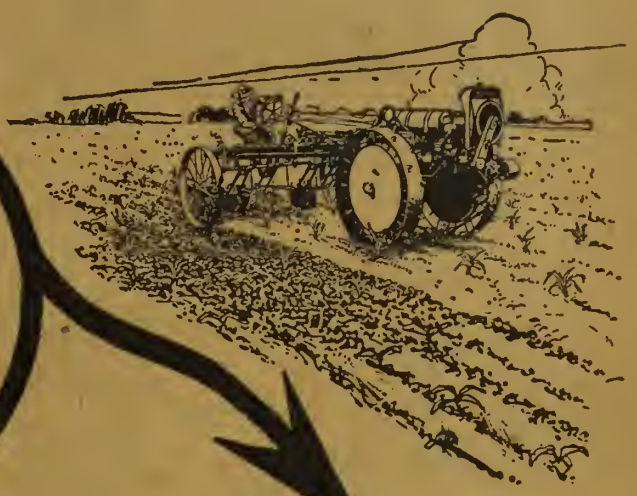
SIX TESTS FOR A FARM POWER-PLANT

There are many tractors, but the *Moline* Tractor is *Universal*

It is THE ONLY FARM POWER-PLANT

Combining

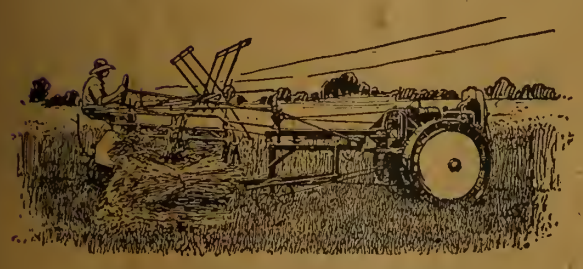
6



Exclusive Features *with* *Indispensable Results*

1. Does all field work, including cultivating, harvesting and belt work	*Means*	No duplication by horses
2. One man completely operates both tractor and all implements	*Means*	A large saving in labor
3. A single seat in the center of all controls of tractor and implement	*Means*	Great ease of operation
4. A single unit of operation—the tractor and implements form but one unit	*Means*	Can back and turn short
5. Operator sees all his work—"Foresight is better than hind sight"	*Means*	Better and faster work
6. Tractive power in front of the work with operator behind the work	*Means*	Power like horses are used

UTILITY IS NOT SACRIFICED FOR PRICE



The Power of a Correct Principle

The principle of doing all field operations with one man sitting where he can watch his work is correct, or farming has always been done backward, and the operator would always have ridden or led his horses instead of driving them.

The Moline Universal Tractor places the power of nine big horses where the horses stood—is driven just like horses are driven, from the seat of the implement, and hitched up to the implements just like horses are hitched.

NOTE—**If desired you can use the "drag behind" or horse drawn implements you now have with the Moline Universal the same as with other types of tractors.**

See your Moline Dealer or write our nearest branch for full information.

Bargains *in* Food

The place to seek bargains in food is in your own land where a few *cents* invested in seeds bring *dollars* in return.

Note the following large returns possible from Morse's Seeds—and plan now to raise vegetables on your own land for your own use and for the market:

2 oz. cabbage seed costing $1.00 produce 20 wagonloads
2 oz. tomato seed costing $1.00 produce 10 wagonloads
4 lbs. onion seed costing $7.00 produce 8 wagonloads
6 lbs. carrot seed costing $6.00 produce 40 tons
6 lbs. beet seed costing $6.00 produce 40 tons

How else can you make your money yield such large returns? But be sure you get all your seeds from Morse. Morse's Seeds are soil-tested and true-strain. They grow and produce. They yield large crops of fine vegetables. Write today for quotations on larger quantities of the seeds listed above and for all other seeds you need.

Write today for the 1920 Garden Guide, a practical manual of Pacific Coast planting. It will help you —and it's free. A post card mailed today brings it

FUMIGATION FOR MEALYBUG

(Continued from Page 191)

degrees gaincd during the first eight minutes; maximum temperature attained 104 degrees Fahrenheit; temperature slowiy dropping during the next seven minutes, total exposure 15 minutes.

In practice the operator should alm to obtain results as near an average as possible between these two extremes. This will insure an eradication of the insect and cause no injury to the vine.

If the rules of this method are carefully observed it will take but little practice for the operator to become proficient.

Cost of Fumigation

Most of the infested vineyards are of the table grape varieties. The vines are generally planted closer together in the rows than the distance is between the latter. Often the vines are six feet apart in the rows and the rows eight or ten feet apart. A sheet ten by 30 feet will cover four average sized Malaga vines. If the vines are more than six feet apart in the rows it may be advisable to fumigate only two at a time because of the difficulty of handling a long sheet and also on account of using so much more sulphur than necessary for the distance between the pairs of vines.

A long sheet used as a tent is handled much more conveniently when removed from one row to the next, rather than from a given number of vines in a row to the next consecutive lot of the same row. The sheet is raised, uncovering the vines just fumigated, pulled off and back from these and dropped over the next row. The outside surface of the sheet when on the first row becomes the under surface when covering the vines of the second row, and the right hand longitudinal edge of the sheet when on the first row becomes the left hand edge when it is placed over the second row. There is economy of time in using two sheets. These should be placed to cover a consecutive number of vines in the same row, both tents being removed so as to cover vines occupying the same position in the next row, one tent being used for fumigating while the other is being prepared for the operation. It is difficult to state the cost of the tent sheet, as this depends much on the size and the material. Old citrus fumigating tents from which these can be made may be bought for from $10 to $25.

The 10 inch frying pan with cover, supports and pin cost $1.25; the 18 inch distributing cover can be made to order for $2.75.

Sulphur wicks can be purchased in small lots, say of 20 pounds, at 22 cents per pound, refined lump sulphur in 150 pound sacks at $2.80 per hundred or 2.8 cents per pound. With a little practice two men can handle two tents, placing one in position while fumigation is under way for the other. Three fumigations per hour can be done with sulphur wicks and two and one-half fumigations during the same time can be made with refined lump sulphur per each tent.

FRENCH PRUNE IN CALIFORNIA

(Continued from Page 194)

satisfactory commercial purposes. For this reason there has been an active demand among prune growers for a larger French prune having the valuable characteristics of the established variety. Until recently all efforts to achieve this result seem to have been failures. The trouble with the larger fruited varieties, as a rule, is that the fruits are likely to be of poor quality, coarse, and stringy in flesh, or have large, undesirable pits."

Following the above quotation is a detailed history of Mr. Coates' work in selecting this large size and especially high quality fruit bearing tree. Mr. Shamel says:

"The fruits of the No. 1418 strain average about 25-30 to the pound as compared with an average of from about 50-60 to the pound in fruit of the parent variety. The fruits of the No. 1418 strain drop clearly from the trees and are so firm that in a recent field examination no damage could be observed as a result of their fall. There was little or no bruising or other injuries observed in the fruits on the ground."

RED SPIDER ON CITRUS

Many of the ills the citrus tree is heir to come because of the weakened condition resulting from insect attacks. Besides, abnormal weather conditions have more serious effect on citrus orchards which have had their vitality sapped by continuous sap-sucking operations of the red spider. We referred some months ago to serious wind injury in an orange grove while alongside another orchard showed better conditions and far larger uninjured crop. This because the first orchard had not been properly protected from red spider. Red spider is one of the smallest of our citrus pests and works in a way which does not attract attention, unless the grower is observing, until the tree is seriously injured. Many feel that the best procedure with this pest is to assume it is going to come and "kill it before it gets here." However, we have asked Prof. Quayle to give us in a short outline the best method of dealing with this pest and apparently he feels that the grower with two eyes can determine the status of the pest.

Prof. H. J. Quayle

The most generally recognized treatment for this pest is lime-sulphur solution used at the strength of two to two and one-half per cent. In most cases this spray gives satisfactory results, but in certain sections the spiders seem to be more persistent, taking several applications with still more or less of the spiders present on the trees. In such cases, the addition of dry sulphur to the amount of 10-15 pounds to the 200 gallon tank is of benefit. This simply acts as an additional amount of sulphur left after the spraying, which will continue to act on the spiders providing the weather is warm enough. The success of red spider control is more or less dependent upon the weather, even in the case of the lime-sulphur solution, and very much dependent upon the weather where the dry sulphur is applied.

As a general rule red spiders appear in greatest numbers during the spring months, although in favorable seasons they may appear at other times, particularly in the fall. Red spiders do not occur in the same numbers throughout all the groves of a district excepting in those districts where the red spider is troublesome every year. The time of control is a question therefore for individual judgment very largely. If the grove is watched and the status of the red spider noted, the proper time for applying treatment can be determined. Excepting in some of the districts that can be counted upon with certainty it scarcely pays in my judgment to apply treatment when the proper time of the year comes around. In other words, the status of red spiders on the trees should be the criterion for starting control work rather than the particular time of the year.

WINTER INJURY TO WALNUTS

Circular No. 216 of the Agricultural Experiment Station, College of Agriculture, Berkeley, will be of interest to every walnut grower. It touches upon winter injury or the die-back of the walnut. It is written by L. D. Batchelor and H. S. Reed. We quote from it as follows:

"This circular contains an account of studies made through several seasons on the so-called die-back or winter injury of the Persian walnut (Juglans regia). In certain districts where walnuts are commercially grown, the trees have suffered greatly from this trouble, and in some cases parts of orchards have died from this cause.

"Unfavorable soil or climatic conditions which would show little or no effect upon many species of orchard trees, may seriously injure, if not actually kill, a walnut tree. The effect of such unfavorable conditions is often first clearly manifested in the early spring. At that time the tops of healthy trees make rapid growth, whereas the tops of injured trees show no growth whatever. Frequently unfavorable conditions not only cause the death of the uppermost twigs but also of some of the older branches."

The circular follows with a full description of this trouble which has caused a great loss in walnut sections. The text is made much plainer by several photographs.

General Motors Trucks

SOONER or later you expect to get a motor truck for all-around farm use.

The GMC Model 16 is America's standard all-purpose truck.

It was standardized by the government for all military work in the ¾ to 1 ton class. Any American soldier in the late war can tell you of its record.

We have yet to find the first dissatisfied user of a GMC Model 16.

It has all the speed you want—will carry its capacity load safely under even adverse conditions.

It's a time saver and money maker for any man who needs a truck of this capacity.

For the dairyman, the fruit grower, the market gardener, the small stock raiser and the general farmer who does not have need for a heavy truck, it has no superior.

But the Model 16 is only one of a family of five GMC trucks, ranging in capacity up to 5 tons.

Thousands of GMC trucks are in service in all kinds of business. GMC dealers and service stations are to be found in every state in the union.

Tell us the nature of your roads, the distance you have to haul and your principal uses for a truck and we can help you select the proper model.

World's Largest Makers of Stump Pullers!

Vegetables in the San Gabriel

By Ernest Braunton

THE peerless climate of the San Gabriel Valley of Los Angeles County is not without its drawbacks, for the cauliflower growers say that recent weather has been too good and some others complain of need of rain, not for soil moisture so much as for protection against plant diseases and pests. The cauliflower men waited patiently through a cold spell that would not allow the plants to develop and hoped for a time of neutrality, warm enough for both young and maturing crops. But the very warm days came, and with them a rain. This was glorious weather for the young but it caused the maturing heads to start growth suddenly, open up so no longer solid and rapidly become soft. This necessitated close picking of the best heads and rushing them into iced cars within a few hours at most. One prominent grower with a heavy crop in the field said he would not pick another head and unless more favorable weather came at once the cauliflower harvest in the El Monte section would be over in a few days.

Celery Fields

The celery growers in the same district care not a whit for temperatures but the shortage of rainfall has allowed the blight to develop and in common with the spinach growers, they are hoping for rain, for that stops development of this disease. As the local shipping season for celery lasts until March, it depends upon the weather as to whether the crop or the blight wins. If no rains come the crop may not be marketable. The same reports come from other districts. One of the government men present stated it is so bad in Florida this year that its control is doubtful and the industry may have to be abandoned, as it has been in parts of California. The rain is equally valuable in driving away insect pests and growers having fields of young cabbage and cauliflower are much troubled with aphids.

The Spinach Crop

J. M. Slaughter is now taking from one field of high grade spinach, but in others frosts at night with a temperature of 80 at midday, without rain, is not good spinach weather. Mosaic leaf, blight, aphids, all disappear with a good pelting rain. It is difficult to find a spinach that will do well in this district, though seeds selected from blight resistant plants will help much. While Broad-leaved Prickly has been grown in the past, some Broad-leaved Flanders will be tried next year. Spinach is a fine short season crop when favorable weather prevails, for it is but three months from seed time to harvest. Mr. Slaughter plants, cultivates and harvests by hand. The seed is drilled in rows ten inches apart and the seeder set to drop the seeds at half inch intervals. The plants are not thinned and all may grow that will. The maturing field has not been irrigated, but if the season is without rain one or two irrigations are given. The crop now being harvested runs six to eight tons to the acre and averaged in price about $48 a ton, one-half the crop being delivered at the packinghouse and the other half at the roadside.

Slaughter on Potatoes

Mr. Slaughter laughs as he tells a potato experience. Last year he cut his potatoes, sacked them and dipped in a corrosive sublimate solution for a half hour. He then spread them out about four inches deep and while still wet sprinkled lime over them freely. He then raked them all about until every one was coated with white. The crop was very light everywhere last year, but his quality was of the best. Such treatment is not considered good practice, however, and all other conditions were probably highly favorable. The crop, of two varieties, averaged about 105 sacks to the acre where in 1917 the same field ran 165 sacks. One peculiar feature of the 1919 crop was the growing, side by side, under the same treatment, from the same seed house, of American Wonder and White Rose, said by many to be one and the same. But the former yielded 135 sacks to the acre and the latter but 75 sacks, and no reason is known for the difference in amount, the size and quality being about equal.

Mr. Slaughter was having a field subsoiled with a Moline tractor and two shoes. The plows had been removed and the shoes put in their places, being some specially made for this plow at a cost of $35. When routed out one way the machine was then run crosswise. In this way an average depth of at least 16 inches will be loosened, in places 20 inches. Mr. Slaughter said that in heavy soil a more powerful tractor and a stronger shoe or beak would be necessary, but that in his soft black soil the Moline did perfect work.

Agriculture at Soldiers Home

Pacific Branch, Home for Disabled Volunteer Soldiers, is the official name of the institution which the post office department designates "Soldiers Home, Los Angeles County, California." The tract contains 722 acres o'er hill and dale, 520 of which is under cultivation. The agriculture there is as varied as on any ranch in the state, for it runs from beets to bees, cabbage to canned goods, and oats to oranges.

The grain acreage is about 400; the vegetable garden, 53 acres; citrus, four acres; grapes, one acre; sorghum, 20 acres; buckwheat, for the bees, three acres; and the remainder is a mixture of all sorts of fruit trees and odds and ends, figs, walnuts and peaches predominating. Nothing is sold from the farm except surplus lemons. Every sort of vegetable needed may be found, an almost endless list.

One new increased acreage was being developed while the writer was there. Fifteen thousand strawberry plants of Kellogg and Brandywine were being set out and a shipment of Peerless, Acme and Banner are on the way. The land is plowed and harrowed, cultivated in furrows 42 inches apart, with smoother attached, and the strawberry plants set on the flattened ridges, 14 inches apart in the rows, the latter of course being 24 inches apart. Water is run down the furrows immediately after planting.

The domestic water supply is pumped from 14 wells on the place and stored in a million gallon reservoir, but the irrigation water, when there is any, comes from Mandeville Canyon in the adjoining foothills. Just at present there is none, though sorely needed. But Owens River water is to run through the ranch when a tunnel is completed, and the distressed vegetation and other things will find relief.

There are 108 colonies of bees that are now being fed. Last year but 1,900 pounds of honey was recovered, but in 1918 the crop was over two tons.

In addition to many minor conservation enterprises there is a cannery that in 1919 put into gallon jars (no cans used) 17,000 gallons of fruits and vegetables.

The agricultural activities of the home are in charge of the quartermaster, Captain M. S. Murray, a retired army officer who has had much horticultural experience while stationed in New Mexico and now in his seventh year of service in the "home." The work is, however, much handicapped through lack of modern equipment and civilian experts to take charge of farm, garden and the various departments —E. B.

Vegetable and flowering plants are often mulched with well rotted manure during the dry season. This supplies food and also keeps the roots cool and moist.

No home is complete without flowers at least a part of the summer months. Gladioli and dahlias are at their best. There are some fine varieties of gladioli to be had.

POTATO GROWING HINTS

By Ernest Braunton

I RECENTLY visited a potato grower, C. F. Richardson, of the San Gabriel Valley of Los Angeles County, who was busy among his men, cutting potatoes faster than any of them. They were working on Red Rose which will be planted at once as the eyes have already started and the stock could not therefore be dipped as corrosive sublimate is nearly as hard on potato eyes after they are open as it would be on human eyes. Planting will be in rows 33 inches apart and the pieces dropped 13 inches apart, by planter, which may be set only 9, 11, 13, 15, or 17 inches apart.

Mr. Richardson was asked his opinion as to the American Wonder being a distinct variety and said he so considered it midway between White Rose and Burbank. It proves a good variety on heavy soils where some others do not thrive. British Queen is a prodigious cropper on rich soil, but White Rose is two weeks earlier and therefore commands the higher price. But the Queen will yield the heaviest and White Rose more easily "runs out." Mr Richardson believes in change of location so is this year shipping seed to Inyo County and will next year bring the crop to Los Angeles County to plant once more on the old fields. He says there is dire need of breeding up stock and selecting closely so we can raise our own seed that is reliable. Too many culls are now being planted.

The Next Ranch

E. D. McSweeny is preparing to plant 100 acres as the spring operations, about 60 acres of White Rose and 40 of British Queen. In the harvest of 1919, now just closing, the 150 acres averaged about 100 sacks to the acre. J. G. McSweeny, his father's aide in the management of the ranch, says the White Rose is not so resistant to the blight as the British Queen, but is a fine 90 day spud. Last season they sprayed three times with Bordeaux mixture as a preventive measure. It may, or may not, have been needed, but the careful grower runs no risk that may be eliminated. All stock is dipped in the corrosive sublimate (bichloride of mercury) solution of one ounce to eight gallons of water, or one part to 1,000, and left therein for one and a half hours.

The spring planted crop should be harvested in June and if in good shape may be used for seed to plant by August first, but as it is not always up to the required standard, the problem is solved with cold storage seed. Mr. McSweeny now has 700 sacks of British Queen in cold storage at a temperature of 38 degrees. These will be taken out July 15 and planted. One advantage of cold storage seed is an assured good stand. Another is the earlier crop. When the June harvested and the cold storage are planted side by side the cold storage comes up in two weeks, while the fresh seed requires three weeks. Thus storage advances the harvest one week or in favorable seasons perhaps ten days. What is urgently needed is a potato with a shorter season, one that can be planted after July, avoiding the hot weather, and be harvested before the frosts come. At present seed brought from upland or mountain valleys in Washington, where the summers are short, would seem best to meet this requirement.

Potato pickers are now being paid 40 cents an hour, six men to each tractor digger or ten men to a horse power digger.

FERTILIZERS BOOST TOMATOES

By J. T. Rosa, Jr., University Missouri

Results of recent fertilizer tests made by the horticultural department of the Missouri college of agriculture in cooperation with tomato growers in various parts of the state show that the yield of tomatoes may be greatly increased by use of commercial fertilizers. In several cases the yield has been increased from one or two tons to over five tons to the acre. Also the earliness of the crop was influenced very markedly by the fertilizer, as the fertilized plants began heavy bearing from four to five weeks earlier than did the unfertilized plants. As the market price is much higher for the early fruit, the increased earliness of the crop would greatly increase its value.

In the case of tomatoes grown for canning factories, the period of heavy picking averaged six weeks on the fertilized plots, but only three weeks on the unfertilized plots. By doubling the length of the season of heavy production by means of fertilizing the crop, both growers and cannery men can handle a much larger quantity of fruit.

One of the outstanding results in these tests, was the vigorous growth of the fertilized plants in the early part of the season. This resulted in a well developed plant, full of green fruit before the season of hot, dry weather arrived. Stable manure and poultry manure proved to be excellent fertilizers for tomatoes when well rotted, and applied before plants are set. However, these materials did not speed up the earliness of the crop as much as commercial fertilizers. Acid phosphate was the material which produced the most striking results, while the results as a whole from ten different tests indicate that a fertilizer analyzing three or four per cent nitrogen and 12 per cent phosphorus may be expected to give the most satisfactory and economical results. This fertilizer should be used at the rate of at least 200 pounds per acre, and preferably should be drilled into the row a few days before plants are set.

A dehydrating plant is to be installed in connection with the cannery at Arlington, Riverside County.

GROW CORN

King Philip Corn is yielding 100 bushels to the acre in the crop now being harvested by Ratto Brothers in Contra Costa County. There are some 200 acres in the field and all of the land was flooded last spring. The Ratto Brothers have had considerable experience in corn raising, having farmed the land on the Clifton tract for a number of years. Such a record breaking crop is expected that lumber has been ordered for about 100 feet of extra corn cribs. Estimates of the crop vary from two and a half tons to three tons to the acre. It is confidently expected when the harvest is finished that 100 bushels to the acre will be shown.

The gratifying returns for the labor and effort put into cultivating this wonderful peat soil can be readily estimated with corn selling at $60 a ton. The cost of seeding is so small as to be almost negligible. Seed corn sells at three cents a pound and from ten to 15 pounds only are required to the acre. The outlay for seed represents at the outside 35 to 40 cents an acre. Compare this with $4 for barley and $5 to $6 an acre for potatoes. Corn is one of the surest producers and seed of the finest quality can easily be secured.

TRADING IN THE OLD CAR

The power plant of a good car will continue to function well years after the top and finish on the body have become very shabby. In fact, many cars are traded in just when the power plant is at its best. All mechanics know a new piece of machinery doesn't operate smoothly and at full efficiency until it has been run sometime. Meanwhile, the paint, varnish, lacquers, etc., put on to make it look attractive in the show room have lost their pristine newness.

It's all very well to get a new car every year if one can afford it, but many do it who can not afford it, and it really isn't necessary in most cases. An examination will generally show that the power plant is in good shape and the surface shabbiness will readily yield to the skilled ministrations of an auto painter and top maker. And a new top and new coat of paint costs a lot less than a new car.

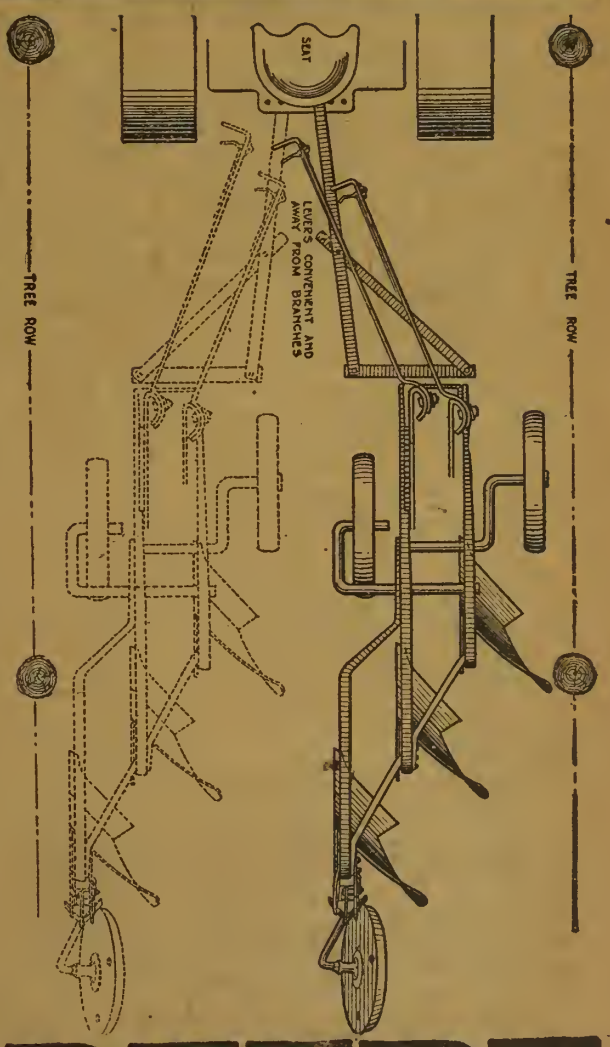
This is not an argument in favor of keeping a car in service for several years. After the power plant begins to deteriorate repair bills mount up; annoying break-downs on the road become too frequent and it then becomes economical to replace the old car with a new one, but such replacement is by no means necessary as often as many car owners seem to believe. The painter and trimmer can work wonders with a car showing signs only of surface wear.

It's very true in the auto industry that "wilful waste causes woeful want," and it is waste to discard a perfectly good auto power plant just because the outer shell doesn't look as spick and span as it might. That defect is too easily remedied.

Here's an Orchard Tractor Plow Built the Way You Want it

BY means of its reversible hitch you can set the John Deere No. 8 out to either side for close work in throwing to or from the row. And you can angle the levers in, no matter to which side you set the plow. That hitch and lever construction is one of the big advantages of the

JOHN DEERE No 8
ORCHARD TRACTOR PLOW



With the plow working close to the trees, the levers are always easy to reach from the tractor seat, out of the way of limbs, and out of the way of the tractor wheels when turning short.

Doesn't Scar the Trees. Note also the wheel base design that permits close work in throwing either to or from the row, without scarring the trees. The furrow wheel doesn't project beyond the inner moldboard's wing. The land wheel is set inside the third beam.

For Use With Small Tractors. The John Deere No. 8 is a low-down, power-lift, easily-handled plow especially designed for use with the smaller types of tractors. It is equipped with three 10-inch bottoms that scour and pulverize to best advantage. The land and furrow wheels have a great range of adjustment for either deep or shallow plowing. It can be used for general field work as well as for orchard plowing.

Tell Your John Deere Dealer to show you the John Deere No. 8, for use with small tractors. And, remember, no matter what the size of your tractor or what the condition of your soil, you can get a John Deere Tractor Plow of the moldboard or disc type to meet your requirements.

Write Today for a folder describing the John Deere No. 8. Ask for Booklet O-47.

THIS WEEK'S COVER

Land of the orange, the lemon and the pomelo is pictured on the cover this week. A bit of reminder of the old home land back in the states glistens from the peaks in the background, but the orange groves nearly shut out the chill. It is all in honor of the National Orange Show which opens next Friday in San Bernardino. The orange growers will make such a showing of their industry, which produces nearly $100,000,000 annually, as will open the eyes of the many visitors to the Golden State.

SUPPORT IT

If state pride were not sufficient to induce fullest support of the National Orange Show which opens next Friday in San Bernardino the boycott established by the labor unions should be. This country went to war with Germany because of the overbearing demands and the arrogance of the Kaiser. The same spirit shown by the labor unions is not likely to meet with very hearty support on the part of the people. Because the management of the orange show saw fit to change the location from the middle of town to the attractive park at Urbita Springs, which is on the line of the Pacific Electric, the labor union, because of a strike which it declares is still on, issued the ultimatum that the show should be taken away from the place where its holding would prove beneficial to the Pacific Electric. The orange growers had no fight with the Pacific Electric, neither were they of the kind to accept arbitrary dictation.

To express our conviction in the matter we use one word which has become a classic—"Bully".

NET WEIGHT

Producers must bear in mind that there is now in force in California a law calling for net weight regardless of the weight of the container, that is, the sack containing 100 pounds of walnuts must have the 100 pounds regardless of the weight of the sack. Likewise, grain sacks, fruit crates, barrels and other containers must not be weighed in. Small bean sacks weigh eight ounces; large ones, likewise wheat and barley sacks, weigh 12 ounces. Quarter barrel flour sacks weigh three ounces; we should have our net fourth of a barrel of flour in addition.

STODDARD JESS

Stoddard Jess, at the head of one of the largest financial institutions on the Pacific Coast, has passed. But we would not speak of him as a banker nor as a financier, rather as a farmer and a man. Ever since he came to California 35 or more years ago, he has been interested and heartily joined in the agricultural upbuilding of the state. For years he grew oranges in the Pomona Valley and by his practice and encouragement induced others to use better methods of culture and marketing. More recently, in the San Joaquin and Imperial Valleys he has headed large organizations which have shown the state's agricultural possibilities in producing food to the limit when the world was going hungry. As a man he has been an inspiration to many a younger man and has offered encouragement and help more substantial than mere words. A guiding principle in his own affair and in those of the great institutions he headed he expressed in the four words: "Character, the best collateral." His sphere of influence has been even greater than California and will extend far beyond his lifetime.

GIVE US THE LEAGUE

"The war just closed called 56,000,000 men to arms, and cost 26,000,000 casualties, 11,000,000 men killed and $221,000,000,000 in treasure. Throughout four and a half years of horror, the people were told that they were fighting a war to end war—that with peace would come a League of Nations to guard the world against the repetition of such a catastrophe. In that hope the people fought the war through to victory."

Of course, politics is an important vocation and must not be interfered with. Hence "we" are justified in hesitating and looking wise while the world's peace is jeopardized.

The California Cultivator, issued weekly, had 44,611 inches of reading matter during 1919, or 773 inches more than any California agricultural paper.

LET US THINK A BIT

The country has been somewhat startled, or at least given a serious thinking spell, by report of a canvass which has been made by the department of agriculture in representative agricultural sections. A questionnaire was sent out as to production, profitableness and possible future production. Forty thousand replies have been received and from them deductions made which have caused the serious thinking.

One of the department officials who has looked them over estimates that nearly 50 per cent of the replies indicate that the writers will either leave their farms, rent them, or largely curtail acreage under cultivation. The reasons given for the discouragement felt by the farmers are summarized in these two short paragraphs:

"Inability to obtain labor to work the farms, hired help and the farmers children having been lured to the city by higher wages and easier living.

"High profits taken by middlemen for their mere handling of food products; and lack of proper agencies of contact between the farmer and the ultimate consumer."

Members of the senate committee, in discussing this situation, have referred to it as "disquieting" and "portentous of disastrous consequences."

"The time is very near," wrote a farmer from East Chatham, New York, "when we farmers will have to curtail production and raise only what we need for our own use and let the other fellows look out for themselves. Labor unions are more to blame for the high prices than anyone else. People are trying to get pay for what they don't earn."

Another farmer wrote:

"I sell butter to the dealer for 45 cents a pound, and the same butter sells to the consumer for 80 cents. In the distribution we lose nearly half, and we lose money on the butter at this price. Such conditions are causing farmers to leave the farm by thousands. We have reached a crisis. You may ask what we would do with the middlemen. I would suggest that it be arranged for them to go on the farm and help produce things. I understand that they might not relish working 14 hours a day, but if we get by in the near future there will have to be some useful work done by everyone."

Another expresses it as his opinion that the way to lower costs of living is to lower the wages in the city which are now so high as to draw all young men from the farms. This farmer said that his year's work averaged him exactly one dollar per day and that his day averaged around 14 hours. "I am done with this kind of production so long as it aids the middleman to get rich at the expense of such labor."

Now the legal department of the state of California is taking steps which will put many of our dairymen out of business.

LOS ANGELES STOCKYARDS?

Last Friday a representative group of livestock men—producers and packers—met in Los Angeles under the auspices of the committees on manufactures and agriculture of the chamber of commerce, to discuss the practicability of establishing union stockyards in Los Angeles. At the conclusion of the meeting a committee was appointed to digest the available data and submit a report upon which action will be taken.

The Cultivator believes that the livestock industry will be materially advanced if union yards are established at San Francisco and Los Angeles, but in view of the recent agreement under which the packers are to divorce themselves from financial interests in all yards it remains to be seen how such a proposition can be financed. Obviously, the producers will be very largely interested in any plan, and it would seem that they should have been allotted more representatives on the committee that is to make the preliminary report.

We note in a press report of the meeting that practically all the opposition came from the cattle producers, who claimed that cattlemen are satisfied with present methods of marketing. We take it such opposition represents but few of the larger operators who by virtue of their volume of business are in a position to drive satisfactory bargains—at least it is certain that there is a wide-spread feeling among small operators and among the majority of pork producers that properly organized and regulated yards would go far toward eliminating many of the handicaps under which they must now market their surplus.

LINCOLN ON OUR NEEDS

Sixty years ago in an address delivered before the Wisconsin Agricultural Society, Abraham Lincoln said:

"My first suggestion is an inquiry as to the effect of greater thoroughness in all departments of agriculture than now prevails in the Northwest, perhaps I might say in America.

"What would be the effect upon the farming interests to push the soil up to something near its full capacity? Unquestionably, it will take more labor to produce 50 bushels from one acre than it will to produce ten bushels from the same acre, but will it take more labor to produce 50 bushels from one acre than from five?

Unquestionably, intense cultivation will require more labor to the acre, but will it require more to the bushel? If it should require just as much to the bushel, there are some probable, and several certain advantages in favor of intensive practice. It is possible it might develop those unknown causes which of late years have cut down our crops below their former averages.

"The thought recurs that education and cultivated thought can best be combined with agricultural labor, or any labor, on the principle of thorough work, and thorough work again renders sufficient the smallest quantity of ground to each man, and this again conforms to what must occur in a world less inclined to war and more devoted to the arts of peace than heretofore.

"Population must increase rapidly, more rapidly than in former times, and ere long the most valuable of all arts will be the art of deriving a comfortable subsistence from the smallest area of soil. No community whose every member possesses this art can ever be the victim of oppression in any form. Such a community will be alike independent of crowned kings, money kings, and land kings."

HEADQUARTERS FOR WALNUT GROWERS

The California Walnut Growers Association proposes to follow its most successful season by building its own building. This will be fitted as no other building in the world ever has been for handling California walnuts. A site has been chosen on the corner of 7th and Mill Streets, Los Angeles. This site, the building and equipment will call for an expenditure of $250,000, the building alone not far from $167.-000. Another $25,000 will be invested in labor saving machinery. The building will contain about 90,000 square feet of floor space, a portion of it seven stories high. It will be fitted to handle walnuts in every stage from harvesting to loading on the cars. Primarily the work will be in processing lower grade and cull nuts. There will be crackers, an endless belt for sorters, carton filling rooms and even machinery for working up and disposing of the shells. The building will also house the business offices of this great association. There will be room for private trackage. There have been employed in the house now occupied from 500 to 750 women workers in handling of walnut meats. The new plant will provide room for 1,000 women workers. The production of walnuts has more than trebled during the last five years.

ORANGE TREE RECORDS

In your issue of January 17, you gave an article on orange tree records and referred to the H. E. Huntington ranches in the San Gabriel Valley. Speaking on the value of fertilizing you gave the following figures: "On a block of Valencias 25 years old, with 69 trees to the acre, the application of fertilizer cost $1.72 per tree, total including everything, even the cost of keeping records. This is $119.86 per acre. This was in 1917 and the treatment was much the same in 1918. The 1917 crop was 697 picking boxes per acre. The 1919 crop was 5,758 picking boxes to the acre." Can you give me any more information on this?—G. K. P.

Another observing reader writes from Beaver Dam, Wisconsin: though he has an orange grove in California and is "from Missouri" as to that place producing "some 83 field boxes per tree." He adds:

"Can't you modify that statement a little? I should like to know, also, whether the manure was applied broadcast, or by the Shamel furrow method. Also, if the tankage is applied in July, how it is got down to root zone."

Mr. Hertrich has already written us stating that the figures as printed were for a block of six acres. He read from the charts as the Cultivator man jotted the figures down and inadvertently gave block figures for the acre figures desired.

Regarding the second query Mr. Hertrich phones us that while he then applied manures with a spreader he now uses the Shamel furrow method altogether. The tankage he drills in deeply after irrigation.

STOP THE DECAY OF TREES

Whenever the limb of a tree is blown off or becomes diseased, the stump should be sawed off even and painted with creosote or tar paint, otherwise decay will set in and spread to other parts of the tree.

Oftentimes even a nail hole will so injure the bark that it will come off, leaving the wood underneath unprotected. If these spots are left bare, decay will set in and seriously endanger the tree. A coat of creosote or tar paint will prevent spread of decay and gradually the bark will grow over the bare place again.

BATS DEVOUR PEACHES

Our federal and state quarantine officials have carefully guarded against the introduction to California of the mongoose and the giant bats known as flying foxes. A recent number of the Victoria, Australia, Journal of Agriculture has the following to say respecting the latter pest:

"There has been a sudden and unprecedented incursion of flying foxes into the Albion Park (N. S. W.) district, the bats having taken up their abode in a deep gorge at Croome, known as 'Foxes Gully.' The foxes are so ravenous that they are devouring half grown peaches. The local residents are banding themselves together to deal with the foxes in their haunts, where they hang from the branches of the trees in the daytime. An application has been made to the government for a supply of ammunition to enable the gunmen to attack the pest before the orchards are ruined. The early appearance of the flying foxes is said to be due to the dryness of the weather inland, which has forced them coastwards in search of food."

A KEY TO SWEET POTATO VARIETIES

The United States department of agriculture is working out a key by means of which varieties of sweet potatoes can be identified. There has always been a great deal of confusion regarding sweet potato varieties, and this key will make it possible to positively identify all true varieties. It is based on the color, size and shape of the stems and leaves, and in the color, size and quality of the potatoes themselves. That the key works is attested by the fact that by its use varieties described at the time Columbus discovered America have been identified.

Considerable new acreage has been planted to almonds in the country around San Miguel, San Luis Obispo County.

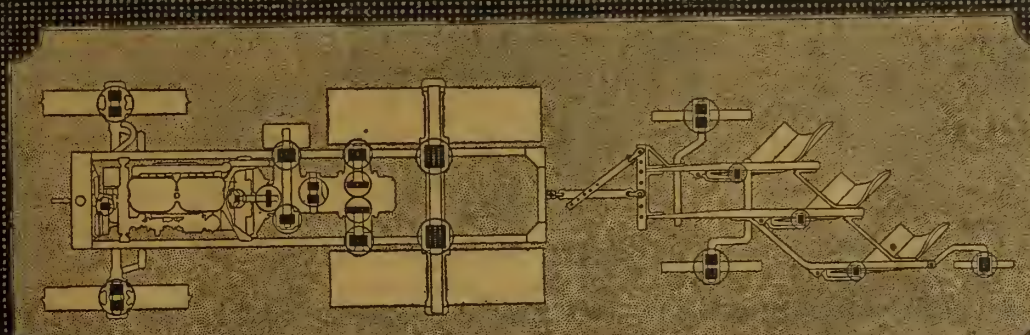
HYATT ROLLER BEARINGS



In 1920 Farm Machinery

THE tendency of all agricultural machinery design is toward increased efficiency and permanent construction.

A refinement here and there—the reduction of weight without sacrifice of strength or power—the use of better grade materials—and the adoption of efficient and anti-friction bearings constitute the main features of their improved construction.

A study of 1920 tractor and *all* power farming machinery specifications shows that Hyatt Roller Bearings will predominate because they measure up to every requirement.

They are built upon a correct principle—hollow spiral rollers—non-adjustable and are as permanent as the shafts upon which they operate.

WESTERN CANADA Farm Lands at Low Prices The Wheat Belt of America

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property.

Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops will bring good prices next year, so take advantage of this condition and get your land under cultivation now.

Write today, stating location of land and number of acres.

This Month in the Ornamental Garden

Southern California

By Ernest Braunton

FEBRUARY is the most active month of the year in vegetative growth. Seeds of all sorts spring into plants and the most dormant of roots send up their annual tops. The gardener must keep pace with nature's program and be up early and late, for swelling buds and unfolding leaves proclaim that spring has come. This month is sometimes dangerous, for distressingly hot weather is not infrequent during the first week, and this may engender a growth that will be caught by a late frost, so February is occasionally our most freakish month. While some sections must guard against such unusual visitations, the most of us are safe in going ahead with all but the most tropical in gardening.

Deciduous trees and shrubs may be pruned, with few exceptions, and because of these exceptions it is better to prune all deciduous subjects immediately after blooming period. No acacias should be pruned now unless they have just flowered or flowers will be cut away.

Rubbish of all kinds should be composted or burned and all insect life found beneath ruthlessly killed, as the season for multiplication is at hand. All growing plants should be fertilized and watered if soil is dry, but feed no dormant palnts; wait for manifestation of life. At time of writing soils are dry and should be turned over and left in the rough for wind and sun to purify and pulverize, but after each rain cultivate and level soil to conserve the moisture for more rains may not come and artificially applied water is not of equal value.

Sowing Seeds

All seeds of tender plants may now be sown and in addition all hardy annuals in the catalogue list. Asters, calliopsis, annual chrysanthemums, cockscombs, salvia, snapdragon, stocks and sweet peas are all in season for best results later on. Plants for shade would not have started earlier, either from seeds or in growth, but will now develop rapidly.

Bulb Planting

Do not divide bulbs or roots, or plant such now, as dahlias, elephants ears, cyperus or papyrus, but amaryllis, anemone, agapanthus, gladioli and lilies may go into the soil, leaving the first named lot for a month, for we should yet have copious rains in the valleys and snow on the mountains and some sharp frosts may result. Even lily bulbs are best set with a handful of sand below and another handful on top. Decaying organic matter in the soil cannot then induce decay in case of a long wet spell. In addition to bulbs and seeds, cuttings of hardwood shrubs will root now, such as crepe myrtle, hydrangea, lemon verbena and lilac. Nearly all herbaceous perennials may be divided and reset, such as golden rod, golden glow and Shasta daisies. In warm sections chrysanthemums and carnations may be propagated, though a little early.

Roses and Trees

No time of the year is better than the present for planting bare root roses. Those in the garden may also be pruned and fertilized to bring spring flowers, for February is the most vital of all months to the rose bush. As it is now, so will it be throughout the year. All hardy or half hardy bedding and border plants should be set at once and all trees planted or transplanted except in the colder sections. The deciduous tree is now in prime condition, but the semi-tropic evergreens are better left for a month later. The time to plant a tree is when it is ready to grow, and oranges, lemons and this class are still dormant. But place your orders at once for fruit trees of all sorts are extremely scarce. Lawns should be fertilized now, for there is less danger of washing such material away than if applied earlier in the season. Stable manure is best if you can get it, and bone meal is a splendid concentrated food. Bare patches in the lawn should be loosened a little and blue grass or clover seed sown.

Northern California

By Albert R. Gould

GARDEN improvement is now the order of the day, or the month, and we now have to study carefully further development of the home grounds. Whether large or small, we want them to look natural, and with the possibility of further rains the ideal planting weather is at hand and the nurserymen have usually a large and varied selection of plants to select from in the early spring. It will always pay the prospective planter to make an inspection tour of the nurseries at this time of the year, after first making a general survey of the garden to be planted. The garden around the farmhouse may need reconstructing. The planting may be too thin and need here and there shrubs to make a bolder effect. There are a number of choice subjects that should be grown in every garden and will be a source of beauty to the home surroundings. Look over your situation carefully and if you are not satisfied with your garden get into consultation with a practical man and have your problems solved.

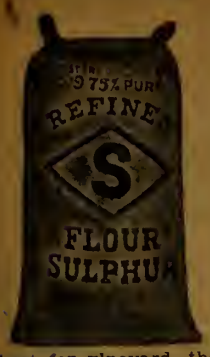
Sweet Peas

This popular flower should be grown by all who love delicate shades. The winter flowering types have been in flower for several weeks and we have seen some wonderful blooms recently. These new varieties are a credit to the raisers and prove what hybridizing will do. They are profitable cut flowers, coming as they do when flowers are scarce. Among the summer flowering group the best are the waved, or Spencer, types, as they are called, and the following is a choice selection from a color standpoint. Size will often depend upon the culture. We have grown them with eight and nine flowers on a single stem, but we worked hard and long hours to do it and as for fertilizer we were very liberal, but close attention to business pays. Among the best are Elfrida Pearson, New Miriam Beaver, Scintillator, Dobbies Cream, King White, Illuminator, Fiery Cross, Helen Pierce, King Edward Spencer. Prepare your ground thoroughly and trench in manure very deeply, having the surface in a fine condition to sow the seeds which should be soaked in water for 12 hours at least immediately before sowing. Some prefer to sow three or four seeds in a three inch pot, but they may be sown in the open ground one inch apart in the row. This method is less trouble than growing in pots and transplanting. After the seedlings get a few inches high, feeding with liquid manure will help greatly. We shall deal with this and other hints later on in the season. In the meantime sow the best seed you can get.

Hardy Plants for Bold Groups

Often we have some positions we need bold groups for, and the most suitable plants to produce this effect are: Hollyhocks in various shades. These are stately plants, growing five to six feet high, and fairly easy to grow from seed, or strong plants may be purchased now which will flower this summer. The Allegheny mixed are fringed, of a semi-double type. Then we have the campanulas, many of which are tall species. The Chimney Bellflower blooms in late summer and has beautiful blue and white flowers growing to a height of six to seven feet. Campanula persicifolia is also useful for grouping, having also blue and white flowers. These average four feet in height. The foxglove, or digitalis, is another subject which may

SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphur that money can buy; the best for vineyard, the best for bleaching purposes, LEAVING NO ASH.

VENTILATED sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste Sulphur.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California Street, San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR." Price List, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred.

Feed Your Crop

All forms of Nitrogen fertilizers excepting Nitrate of Soda must be changed by bacteria into Nitrate before becoming available. This always results in Nitrogen losses.

NITRATE OF SODA

be used in groups under the trees in shaded or semi-shaded locations. Plants are easily raised from seed sown in boxes of light soil. Some of the liliums grouped in solid beds look wonderfully well, and of these we think the following desirable: Lilium auratum, often known as the golden rayed lily of Japan, platyphyllum being the tallest variety. L. Henryi is another good type to grow, and among the best native to North America are L. pardalinum and L. Humboldtii. Lilies thrive best in a rich soil composed mainly of leaf soil and a light loam.

A Beautiful Climber

Among the best climbers we have seen for a long time is the coral creeper, Kennedya comptoniana, which with its delicate purple flowers is a picture itself and may be used to cover pillar, trellis or in a vase. It is a native of South Australia. It requires a fairly rich loam to thrive and a fairly warm position.

Work on the Lawns

There will be little to do in the way of mowing, but keep after the weeds. Never let them get ahead or they will cause trouble. An old pocket knife will be found useful in removing them. Apply bonemeal and dried blood as a dressing before the rains as a renovator.

This Month in the Vegetable Garden

Northern California

By Albert R. Gould

RECENT rains have encouraged gardeners, nurserymen and seedsmen alike, and as a result there is much activity. The days are lengthened somewhat and we shall be able to put in more spare time in the garden.

Your list of seeds for the season should be in order, and the sooner you place it with the seedsman the better, as the rush season with him is now on. It is therefore wise to be there early and be sure to deal with a well established firm. Plant only the tried and tested. Cheap seed is usually too old to germinate and should be burnt.

Apply plenty of fertilizer to the plots while in the state of preparation and study your own particular soil conditions. Apply lime to heavy soils, also work in decayed leaves and wood ashes. You can hardly expect to raise good crops on poor soil, hence soil conditions are of the first importance before wasting seed. Regarding the most important elements in the soil necessary to plant growth we would like to mention briefly that nitrogen gives vitality and produces increased growth, giving the plant a deep green color, and potash will also assist in bringing the plant to earlier maturity. Lime has a tendency to produce a short stocky growth which in root crops is desirable. In the case of fresh farmyard manure nitrogen is present in an organic form but when placed in a heap it becomes heated and fermentation takes place, some of the organic nitrogen being changed into ammonia. When this manure is applied to the land and dug in soil microbes carry on the good work, changing the ammonia into nitric acid. This acid then unites wtih lime in the soil, or potash, then forming nitrate of lime or potash. It will then dissolve in water and passes into the plants, and from either of these they can secure the nitrogen they need. We mention these interesting facts so that our readers can more readily understand the importance of soil conditions. The science of plant food is worth careful thought.

Peas

This crop especially has been helped by the rain, and the cultivator or hoe should be kept moving between the rows. Tall growing varieties three feet and over will need support. Procure bushy stakes and place both sides of the row, or wire stretched tight will serve the purpose. Lucky is the garden free from aphis or green fly. These pests love the peas. To destroy them get busy with the spray pump and nicotine sulphate. The following varieties may be sown this month for

TOP DRESSING TALKS

No. 10

Deficiencies of California Soils---and a Remedy

California soils respond promptly and generously to intelligent fertilization. This is particularly true concerning nitrogen, in which important plant food so many soils are deficient.

Director Hunt of the Berkeley Experiment Station writes:

> "Whether it is Mottle Leaf in orange trees, Little Leaf in peach trees or low yields of wheat, the cause appears to be the inability of the plant to secure and assimiate a proper supply of nitrogen."

As is always the case, some form of nitrogen is better than others. The California Experiment Station advises the growers of this state to use **Sulphate of Ammonia.**

ARCADIAN
Sulphate of Ammonia

Write for information on the proper use of this ammoniate for greatest profits. **Sulphate of Ammonia** is the well-known standard article that has done you good service in your mixed fertilizers for years past.

Arcadian is the kiln-dried and screened grade, made fine and dry for top dressing purposes. Ammonia 25¼% guaranteed. Made in U. S. A.

HARDIE SPRAYERS

High pressure, light weight, large capacity, powerful engine, perfect agitation, simple construction.

HARDIE Power Sprayers are the final word in sprayers. They represent not only years of experience, but also an accurate knowledge of spraying needs and the conditions that govern spraying. Where spraying is most difficult you will find HARDIE Sprayers in the majority.

HARDIE SPRAYERS are noted for their simplicity. No complicated devices to cause trouble when every minute counts. You can put any of the help to work with a HARDIE and get maximum results. Makes the work of spraying easier than ever before.

When you see a HARDIE SPRAYER you will readily understand its superiority. See how compact it is—the few working parts and how every one of them is quickly accessible. There are 21 HARDIE features that make it the leading power sprayer. The HARDIE CATALOG tells all about them. A COPY is yours for the asking. Send today. You can see a HARDIE at your dealer's.

At Last---It's Here

A Great Leverless Tractor Disc, with an

AUTOMATIC ADJUSTABLE **HITCH**

It offers more advanced ideas of construction than were ever before presented

You can get a disc now without levers sticking up on it to break off tree limbs or to break your back "throwin' her out" of the ground.

We have ready for distribution a new tractor disc with the best automatic features ever invented.

The angle of the disc is given by pulling a rope attached to a trip lever on the disc and brought forward to the tractor. To change from straight to working angle all that is necessary is to pull the rope attached to the trip lever which sets the disc to any angle desired.

Besides the automatic features which give this disc an advantage everyone desires, the automatic is one of the heaviest and strongest ever constructed, having braces and cross braces of steel angle irons. This is not a trailer type harrow. It is absolutely impossible for the rear gang to trail the furrows made by the front gang. The frame is rigid. The disc cuts down ridges, fills up holes and levels the ground. Every feature of the construction is for utility and hard service. Made for tractors in 5, 6, 7, 8, 9 and 10 ft. sizes with either 18 or 20 inch cutaway or solid discs. Farmers who expect to buy discs soon should be sure to see this new automatic disc with its many improved features. All sizes on display at the Sales Rooms of

E. P. Bosbyshell Co.

When Writing Advertisers, Mention the Cultivator.

succession: Melting Sugar, tall; Telephone; Little Marvel, dwarf; and Laxtonian, dwarf medium.

Carrots

Sow Danver's Half Long and French Forcing in rows 18 inches apart. Keep the ground well cultivated. Thin out those previously sown to four inches apart in the row.

Onions

Sets may be planted on rich soil in rows 18 inches apart three inches or more apart in the row. They may be used in the green state or if grown on to maturity will produce good sized bulbs much earlier than from seed. The earlier varieties sown in December will now be making good headway and thinning should be completed this month. Plant out any surplus plants. Main crop varieties sown as advised last month will be showing through, and thinning of these may be undertaken at the end of the month. Prizetaker, Ailsa Craig and Australian Brown may still be sown.

Turnips

Thin out this crop, the varieties sown as advised last month, and leave the plants four to five inches apart in the rows. Sow for succession Early White Milan and Orange Jelly.

Lettuce

This useful and popular salad may now be sown every month. The varieties May King, Deacon, Los Angeles or White Paris Cos are all worthy of a place in the home garden. Make your choice.

Asparagus

Secure the best roots of Colossal or Palmetto for planting new beds. Plant three feet apart in the row and prepare with manure before planting. Apply a good dressing of farmyard manure to existing beds.

Rhubarb

This crop thrives on rich soil and will well repay every attention both as regards manure and water. For establishing new beds plant strong roots having several "eyes" of Myatt's Victoria, Crimson Winter and Strawberry varieties. Plant six inches deep three feet apart. It may also be planted in a deep box five feet deep by five feet square having two feet of soil at the bottom. Keep the box covered and water at intervals. Early rhubarb may be obtained in this manner.

Kale and Cabbage

Complete the planting of these on well prepared soil. Giant Narrow kale is the latest new variety, quite useful for poultry. Early Spring cabbage will provide fine heads in a few months.

Southern California

By D. F. Reichard

THIS month Southern California spring starts in earnest. Although we may get a frost now and then the atmosphere in general is warmer and plant life begins to awaken. We ourselves have a longing to get out and stir the earth and plant something. Follow up the impulse by laying off some ground for a vegetable garden even though it is only to plant a few radishes or beans. If you want a real worth while garden look up the Cultivator of January third for suggestions as to planning a garden. If you are planning for a permanent garden with perennial plants as well as the annuals, arrange it so that the perennials, such as bush berries, artichokes and asparagus will be at one side, or at least where they may be undisturbed when working the ground for annuals.

Everything can be planted this month except in low cool sections where planting of beans, corn, melons and squash had better be postponed till the weather warms up a little more.

Plant all trees, vines and roots as soon as possible for the sooner they are in the better root systems they make for the coming year. The same may be said of herbs and strawberries. Make further plantings of radish and spinach, also lettuce plants, onion sets for green onions and seed of cabbage, kale and lettuce to be transplanted within the next two months, at which time tomatoes, peppers and egg plant may be set in their places. Larger planting of Irish potatoes is proper for this month. The last planting of peas goes in this month. Carrots, beets, turnips and parsnips may be planted for succession. If a good quantity of onions are wanted plant seeds of Australian Brown or Silverskin for harvesting next summer. Set out plants of cabbage and cauliflower for late spring heads; these may be interset with onions or lettuce plants which will be out of the way before the others are ready. Small plantings of Canadian and Ventura Wonder beans and early sweet corn may be made in the warmer sections.

If the rains continue to hold off the stuff that was planted during January will have to be irrigated and the ground carefully worked. Thin out plants where they are too close to make proper development. Any pruning that has not been done to shrubs or trees should be done at once because the season is very much advanced this year and growth will be starting before we know it. When the sap starts to come up it is then too late to prune. Spray all deciduous fruits and berry bushes with Bordeaux mixture or lime-sulphur solution. The powdered forms of these are the easiest, nicest to handle. To the desired amount of water add the required amount of the dry powder, stir well and apply with spray pump.

Southern Arizona

By M. E. Bemis

FEBRUARY and March offer greater inducements to the Arizona gardener, possibly, than any other month of the year. The spirit of the seedsman's annual is in the air, and it is at this season that one feels more enthusiasm for planting seeds and watching them sprout than later or earlier.

As the animal, be it boy or colt, that is well born is half raised, so the seed that is well planted is well on the road to feeding the hungry world. Preparation of the seed bed then should be the first consideration. It is true that most of the soils of Southern Arizona are very fertile, but garden crops are plants that readily lend themselves to intensive culture, and therefore it behooves the gardener to introduce some well rotted manure into his soil. Usually this is not difficult to obtain in Arizona, but fresh manure should not be used as a substitute if the rotted is not available. Gardeners are quite well agreed that fresh stable manure "burns" the young plants.

The manure should be well plowed in, or if the plot is a small one it may be spaded in. Deep plowing or spading is just as essential in gardening as in farming, and this is the first step in the preparation of a good seed bed. Harrowing, leveling and working down to a fine condition are steps which should logically follow. As any gardening scheme in Southern Arizona must depend upon irrigation, it is necessary to consider the matter of running the water as a preliminary to the final finishing touches. The lighter the soil the more slope will be required, the heavier soil requiring considerably less.

Naturally with irrigation it is necessary to plant crops in furrows on the sides of ridges. In extremely light sandy soils it may be possible to practice level culture, but I have never known but one gardener in Arizona to advocate this method.

Possibly as good a method as any for common garden practice, that is the home garden, is to run furrows two feet apart, throwing the earth up into a shallow ridge between, five and ten inches high at the centers and broad and flat, with the furrows be-

Insect Enemies and Fungous Diseases

on both Citrus and Deciduous Fruit Trees

These are the most important subjects the owners of fruit trees can read about, at this season of the year. The control of these pests demands prompt and decided action. To let them alone may not only mean failure of this year's crop, but permanent injury to the trees.

Orchard Brand spraying materials are the remedies to use to prevent injury both to fruit and to tree. Here is a list of them.

Orchard Brand Dry Powdered Arsenate of Lead.

Orchard Brand Arsenate of Lead, Standard paste.

Orchard Brand Atomic Sulphur (patented).

Orchard Brand Bordeaux Mixture Paste.

Orchard Brand Powdered Bordeaux Mixture.

Orchard Brand Lime-Sulphur Solution.

B. T. S. Dry Sulphur Compound (patented).

Orchard Brand Weed Killer.

Universal Brand Dormant Soluble Oil.

Universal Brand Crude Oil Emulsion.

Universal Brand Miscible Oil.

Universal Brand Distillate Oil Emulsion.

Liquid Whale Oil Soap.

Black Leaf "40."

Our interests are the same as yours. Write us about your tree troubles.

Wanted to Lease

Orchard ranch and general farm of 50-200 acres. Responsible party. Experienced university graduate. Good references. Will develop large tract of young orchard. Box R, Cultivator.

Better service is assured by the advertiser if when writing you mention the California Cultivator.

tween as narrow as possible. This makes the rows of vegetables about 12 inches apart, if the rows are made about half way down the sides of the ridges, the centers of the ridges being just two feet apart. Where a horse is used for cultivation the ridges may be spaced three feet apart from center to center.

The problem of successful germination is one that taxes the patience of a white man. The Oriental with his infinite perseverance and disregard for time seems not to mind the failures that come from poor germination and plants over and over again, if necessary, with seemingly no discouragement. Planting good seed in moist soil as fine as it can be prepared and just above the water line is about all that can be done. If the Fates are propitious—that is to say, if there is not a combination of very warm days, cool nights and steady drying winds that dry out the soil and form a crust, there should be moisture enough to bring up the seeds before the crust forms. Sometimes when a crust forms it may be broken carefully with a garden rake without disturbing the embryo plants. This must be done carefully, however, as any raking would of course be disastrous. A chopping without moving the earth is all that is needed.

The things that may be planted in February in the Salt River Valley and other locations with similar altitude and soil conditions are: Beets, carrots, collards, sweet corn, kale, kohl rabi, lettuce, mustard, parsley, early peas, potatoes, spinach, Swiss chard, bush squash, tomatoes, turnips, strawberry and cabbage plants, onions seed and onion sets and asparagus roots.

The smaller seeds like beets, carrots, lettuce and mustard, should be planted very shallow, one-half to three-fourths of an inch deep. Crosby's Egyptian, Early Blood Turnip and Eclipse are good beets. Danvers Half Long or Ox-heart carrots; the very early varieties of peas only, such as Alaska or American Wonder; Papago sweet corn towards the latter part of February; New York lettuce; Bush Scallop or Summer Crookneck squash; Prickly Winter spinach; Purple Top Strap Leaf or White Flat Dutch turnips, are among the common vegetables that have proved successful in this climate. Potatoes may be planted any time in February. They do best in the more sandy soils; in fact, it is somewhat of a gamble to plant them in any except the sandy soils. This is true also of sweet potatoes. As a rule potatoes do not require as much irrigation as other crops; in fact, the best potatoes are grown on soils that are naturally sub-irrigated, although some good crops have been grown on sandy soils rich in humus, where they have been carefully handled. For the home garden there should be some potatoes planted, but as a commercial crop, except in soils that have been proved, I would not go heavy on potatoes.

Tomatoes should be started in cold frames. Some prefer to plant these in the row where they are to grow, and if this is practiced it would be better to wait until March. Squashes, although a tender plant, are planted early by the Chinese and Japanese gardeners and the squashes are often on the market before many people would think it was time to plant them. The seed is not expensive and if killed by frost it costs little to plant them over, and if only nipped a little they are not much injured.

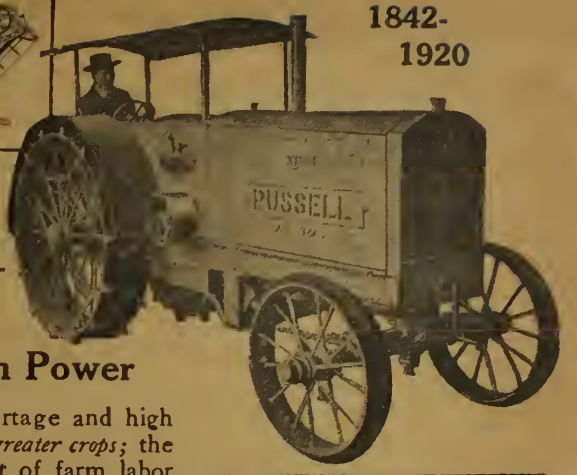
Strawberry plants by good rights should be set out earlier, but they will do very well if put out in February, although one should not expect much of a crop the first season.

Planting the garden is only the beginning. Frequent irrigation is necessary with most plants, but cultivation following each irrigation is highly essential to the greatest success.

MODERNIZING IT

Many knocks among the squeaks,
Tie-bolts that no longer hold—
Darling, you are growing old,
All your members rattle, dear,
Out of joint your timing gear.
Though I seek him day and night
No man born can set you right.
Once I swore that you should be
Always young and fair to me.
But, alas, old fuel bin,
I must trade your carcass in.
—Richard B. Bennett in Motor Life.

1842-
1920



This Year—
Demand
Reliable Farm Power

The world-wide shortage and high price of food demands *greater crops;* the shortage and higher cost of farm labor demands more and *more farm power*—tractors and threshers in particular.

The shrewd farmer cannot afford to risk trouble, loss, delays and breakdowns with new or untried machines—or those rushed through the factory to meet a sped-up scale of production.

For 1920 Russell will build only a few more tractors and threshers than last year—but will *build them right*—true to "old reliable" standards of quality and service.

These are the only kind of machines you want to buy, sell or use—but get your order in early to guarantee prompt shipment.

Send now for Big New Russell Catalog.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Trees for Reforesting

I wish to secure trees for replanting rough land along stream. Would like pine, sycamore and holly. Can such trees be had from government reforesting nurseries?—Subscriber.

We believe the division of forestry grows trees for use only on the public domain and do not think they distribute for planting on private property. However, the trees mentioned are easily secured and planted. The sycamore will usually grow from cuttings taken at this time of the year, and if other sycamores are now growing along the stream it is probable young seedlings may be found in abundance nearby. We have repeatedly taken up these seedlings and have fine large growing trees from them. The pines are also easy to secure and grow, comparatively all growth being raised from seed which every seed house can supply.

Building a House

Where can I find out how to construct a house out of large granite rocks found on the place?—Subscriber, Long Beach.

That is rather a long question and the first suggestion would be to work with builders who have had experience. The mere matter of laying up the boulders, however, is very simple, for with the use of a mortar made of Portland cement one can build a very substantial and dependable wall. If the boulders have been taken from the stream where they have been rolled and polished they can be used in the wall without further cleaning. If, however, they have been dug out from the soil thorough cleaning is necessary in order to get perfect adherence to the mortar and a strong wall.

Olive Cuttings

When is best time to set olive cuttings and how are they set?—Subscriber, Springville.

That depends upon which variety of cutting is to be used. Presumably the subscriber is referring to the ripened wood cuttings. For those there is no better time than the present. That is, the trees are now dormant and the wood well ripened. Select wood the size of lead pencil or larger and cut ten or 12 inch lengths. Some root in sand, others will root directly in the place where the nursery row is to stand. Choose a sandy loam, plow, furrow, place the cuttings—some prefer at an angle of 50 to 60 degrees, others set upright. Plow another furrow so as to throw soil against cuttings, leaving one eye or bud above the surface. If soil is heavy or inclined to liberal supply of moisture do not place cuttings so deep. We have seen large blocks used for cuttings which have been entirely buried, but near the surface, and when the young sprouts come from various portions of these cuttings they are broken off and carefully planted in the nursery row. However, the more common herbaceous cutting used by the nurserymen in propagating olive trees is taken from the tips or new growth. These are rooted only in sand and usually in glass house supplied with under heat. Of necessity this type of cutting is made later in the season when the spring growth permits securing satisfactory cuttings.

Preserving Citron

Please tell me how to preserve citron.—Subscriber, Encanto.

Coit's "Citrus Fruits" gives the following outline of method for preserving citron: "The fruit as it first begins to assume a bright yellow color is picked and placed in brine for a month or longer, the brine being renewed occasionally. Sometimes tender young leaves of the citron tree are soaked with the fruit to deepen the green color. The fruit is then boiled in fresh water to remove the salt and soften it. It is then halved, the pulp and seed scooped out, and immersed in cold fresh water to intensify the greenish color. After this it is covered with hot sugar syrup and allowed to stand three or four weeks, during which time the strength of the syrup is gradually increased. The fruit is then put into boilers with crystallzed sugar syrup and cooked; then allowed to cool, more sugar is added, and it is cooked again until it will take up no more sugar. It is then dried and packed in wooden boxes, each piece being coated with white sugar crystals and wrapped in tissue paper."

Bacon From Moulding

Will you tell me how to prevent bacon from moulding? — Subscriber, Triumfo.

Will some of our subscribers give us a hint in this particular? We have heard that rubbing with olive oil as soon as removed from its original wrap or as soon as cured is an aid in preventing the moulding. However, we have tried this and when moisture and heat conditions are right it will still mould. Occasional wiping with dry cloth and keeping in cold dry place is effective.

Planting Walnuts

I am thinking of planting some black walnut trees in order to have walnuts for my own use. How is the bed for them prepared and when is the best time to plant? Is sandy soil better than heavy soil?—Subscriber, Anaheim.

The method of handling and planting the nuts is given by Prof. Ralph E. Smith in Bulletin 231 as follows: "Walnuts (Northern Blacks) to be used for planting in the nursery should, after gathering, be kept in sacks or other receptacles in a cool, not too dry place until planting time. If allowed to become extremely dry after gathering the nuts germinate much less easily than otherwise. They will usually keep in good condition if tied up in sacks and piled in a cool, shady place. It may be found desirable to allow the outer hulls to dry somewhat before sacking up the nuts, especially in the case of large hybrid nuts, since if sacked and put away quite green the hulls decay and become extremely soft and mushy. Early in the winter, not much later than January, the nuts should be layered in sand or light strawy earth in order to sprout them and segregate the best ones from those that germinate feebly or not at all. This is most conveniently done by constructing a frame about 18 inches deep, either above or below ground, in the bottom of which should be placed three or four inches of sand, then the layer of nuts, which may be either one or several nuts in depth, according to the available space. The nuts are then covered with three or four inches of sand which should be washed down thoroughly between the nuts by a stream of water. The whole bed will thus be well soaked. Instead of placing the nuts directly in the bed it is more convenient in getting them out to put them in shallow wooden boxes or flats, imbedding these in the sand as above described. If this is done it is much easier to get the nuts out for planting than if they are placed directly in the sand. Other materials may be substituted for sand, such as earth mixed with fine straw or manure, or any substance which holds moisture well and from which the nuts can be easily removed. The bed should be so arranged that water will drain away from it and not accumulate sufficiently to rot the nuts, and it should be protected from rain if there is any danger of such an effect

Heider

Twelve Years Actual Field Work

Think of the *assurance of service* you have in the fact that America's leading power farmers have used the Heider on their farms for 12 years. Many of the original Heiders are in faithful use today. You do not have to take one or two days' "demonstration" as proof.

Model D 9-16

Rock Island One-Man Outfits

Heider Model D 9-16 with No. 9 Rock Island CTX two-bottom Power Lift Plow directly attached. To the right, Heider Model C 12-20 with Rock Island No. 19 CTX two-three bottom Power Lift Plow. Foot-lever control. Automatic power lift.

No Gears to Strip! That means saving wear, trouble and expense. Heider Friction Drive does away with clutch, transmission gears and bevel gears. All three units are in one. Power ordinarily used up by these parts is put into drawbar pull or belt work. Steady, resistless power under perfect control. Seven speeds forward, seven reverse, for traction or belt with one motor speed and one lever.

Two sizes, 12-20 and 9-16. Write for catalog of Heider Tractors and Rock Island Tractor Tools.

E. P. Bosbyshell
Los Angeles, Calif.

Manufactured by
Rock Island Plow Co.
Rock Island, Ill.

Model C 12-20 *with No. 19 Power Lift Plow Attached*

Rock Island No. 38 One-Man Tractor Disc

Close-up levers. One man easily operates both tractor and disc. Extra high clearance. Two sizes. 8 and 10 feet cut. Solid or cut out discs.

Rock Island No. 12 Tractor Plow

Successful behind *any* tractor. Front furrow wheel lift equipped with 2, 3 or 4 Rock Island CTX bottoms that turn the furrow slice clear over, pulverizing soil and preventing air spaces.

Quick Detachable Shares

from that source. The nuts need to be constantly well moistened, however, in order to start germination, and if drainage is good there is not much danger of getting them too wet. The bed should be located in a place where it will receive the heat of the sun in order that it may not he too cold for germination, and it may he underlaid with manure if it is desirable for any reason to hasten the sprouting of the nuts. As soon as a considerable portion of the nuts has begun to sprout in the sand hed they must be gotten out into the nursery as soon as possihle."

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Ownership of Homestead

Several heirs own a homestead left hy father. Only one has stayed on the homestead and has paid the taxes for 20 years. No rent has been asked hy the other heirs. Does this entitle the heir to ownership of the property? —Suhscriher, Sunol Glen.

The only title which could he claimed would be one by adverse possession hut it is essential to the title by adverse possession that it be hostile to that of all other persons. The title of the heir staying upon the property in the case mentioncd can in no wise be considered as hostile to that of the other heirs. If it was in fact a true legal homestead, it would descend upon the death of the parents to each of the heirs as joint tenants. If the word "homestead" is merely used in the common expression as frequently used, it is merely an unprobated estate. In neither event can the possession by one he considered as hostile to the rights either of the other joint tenants or of the estate itself. Everything which the heir in possession has done is merely in preservation of the estate. He entered into possession under no color of title other than that jcintly held by all, nor is there anything which he has done which can be construed as placing the other heirs or the estate upon notice that there is any hostile claim. It is true that in the event of administration of the estate an accounting would be necessary in which the heir in possession might he entitled to receive compensation for his expenses in caring for the property or he might be charged with rents and profits of the property.

Partnership Pump

There is a pumping plant on the land of C in which A owns one-half and B and C each one-fourth. A separate deed covers the land upon which lies the pumping plant, and the interest of A therein is covered hy a mortgage upon his land. The present pump is worn out; B and C wish to install a new pump hut A refuses to contribute to the expense. How can B and C proceed?—Subscriber, Redlands.

It is evident that the parties are tenants in common in respect to the pump. In such case each of the tenants in common may be held to contribute for expenditures necessary for the pump and preservation of the common property incurred fairly and in good faith. Before making such repairs B and C should notify A of their intentions so to do, which notice should state the character of repairs and the expenses necessary thereto with his proportion of such expense and make demand upon him for payment thereof. If he fails to make such contribution within a reasonable time, then B and C can proceed to install the necessary repairs and thereafter bring an ordinary action against A to recover his proportion of the expenses together with interest and costs. That method would probably be better than discontinuing the service of water, although there possibly could be no objection.

Payment for Debt

Can a merchant take property of an employer for debt contracted hy employe? If so, how? A bought goods from B, a merchant, who sues A and attaches personal property of C, his employer, for the debt. Debt was contracted without knowledge of employer. Two goats were taken from the care of the employe, under protest that there was no law for such action. B seems to have the idea that A and C are partners, but A is only hired to take care of goats and other stock. C was not home when goats were taken. What steps can he take to recover goats? He has filed affidavit of ownership, but B refuses to bring goats hack and is making charges of 50 cents per day for feed and care. Can he make A or C pay these charges? A has only her wages to live on and C works for wages. C has not been able to pay A wages for two months. Does it make any difference what A does with merchandise hought in her own name?—Subscriher, Felton.

B has no right to take the goods of C for the debts of A and the relation of employer and employe does not enter into the case. C's proper course is to file an affidavit of ownership with the constable or sheriff who levied the writ of attachment upon the goats, whereupon the officer should release the animals from the levy of the writ. In case he does not release these animals, then the owner may hring action and claim delivery against said constable or sheriff for the animals or their value and seize them upon the writ of replevin issued in such case. If the officer seizing property does not release it upon filing the affidavit, it is because the party bringing the action has indemnified him by bond. In case he refuses to release, if the owner of the animals is successful in his replevin suit, he will be entitled to recover the animals without charge for their keep and may in such action recover damages for their detention.

Chickens and Hogs Trespass

I have grain and potato land which is unfenced. Can I compel my neighhors to keep their chickens and hogs off my place, as I have heen damaged to quite an extent by the trespasses? —Subscriber, Highlands.

The premises being unfenced, you are entitled only to take up the trespassing animals as estrays, in which event you can hold them for the costs, fees and charges as provided in the estray act. If they are caught doing actual damage, it is doubtful if the court would seriously hold you if you used only necessary force in driving them off, even if some injuries might happen in the course of the use of such force. I have known instances in which chicken dinners are of good effect in those cases.

Homestead

I filed on a homestead in North Dakota 18 years ago; land was unfit for agriculture and I did nothing with it. May I file upon another?—Subscriber, Ceres.

The act of congress of September 5, 1914, provides that any person otherwise duly qualified to make entry to puhlic lands under the homestead or desert land laws, who has theretofore made or may hereafter make entry under such laws and who through no fault of his own may have lost, forfeited or abandoned the claim, shall be entitled to the benefit of the homestead or desert land law as though such former entry had never

Agri GYPSUM

Ask any authority on soils, fertilizers, plant growth or botany about gypsum and he will tell you of uniformly beneficial results when applied to soils.

California producers have many and varied uses for AGRI GYPSUM. For such cover crops as melilotus, vetch, alfalfa, and legumes which use much sulphur, AGRI GYPSUM supplies the Sulphur and these crops fix the NITROGEN from the air by means of little lumps or tubercles on their roots. Use AGRI GYPSUM—plant legumes for cover crops and grow your own nitrogen—the most valuable element you can supply to your grove or crop.

At the roots of cover crops are little tubercles of nitrogen obtained from the air. AGRI GYPSUM supplies the sulphur for a monster cover crop.

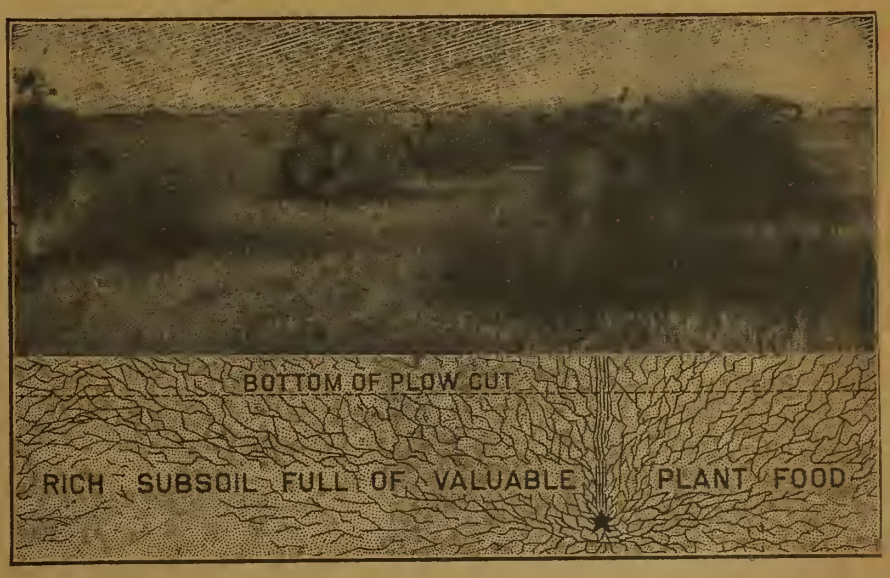
When all fertilizers are scarce and high AGRI GYPSUM applied to your soil makes every beneficial element active for plant growth.

Alfalfa Should Be Liberally Supplied With AGRI GYPSUM

Alfalfa is one of the largest consumers of sulphur. Sulphur is deficient in nearly all soils while AGRI GYPSUM contains more than 40 per cent sulphur. AGRI GYPSUM will supply a more vigorous growth of alfalfa than anything you can apply and at less expense.

Useless Alkali Lands Can Be Made Highly Productive When AGRI GYPSUM

AGRI GYPSUM is a specific for black alkali. It turns the harmful sodium carbonate into comparatively harmless sodium sulphate. Results of experiments are available confirming our statements. If your land is inclined to alkali or spotted with alkali treat it with AGRI GYPSUM. The improved value of the land and the resulting crop growth will be very much greater than the small expense for the AGRI GYPSUM.



Explosives loosen the soil—AGRI GYPSUM loosens valuable elements in the soil. It also is very beneficial in making the soil "fluffy" where it is inclined to pack.

Crops greatly benefited by AGRI GYPSUM include:

Oranges	Potatoes	Vetch	Barley
Lemons	Cotton	Alfalfa	Deciduous Fruits
Beets	Cabbage	Melilotus	Milo
Beans	Cauliflower	Peanuts	Cantaloupes
Grains	Grass	Grapes	Truck Crops

Ask your dealer for AGRI GYPSUM and you will be sure of the product properly balanced, uniform and ground fine to do the most good with the least amount used. If your dealer cannot supply you write

United States Gypsum Company

LEGAL QUERIES

(Continued from Page 209).

been made, provided that such applicant shall show to the satisfaction of the secretary of the interior that the prior entry was made in good faith and was lost, forfeited or abandoned because of matters beyond the control of the applicant and that he has not speculated in his right, nor committed or attempted to commit fraud in connection with such prior entry.

Selling Real Estate

I am considering selling real estate on monthly installments. During the period of monthly payments am I required to pay taxes? Should I give buyer a deed or contract when he makes first payment? — Subscriber, Lakeport.

The contracts which are usually drawn provide that the purchaser shall pay the taxes; if not paid, they become a part of the principal and bear interest as the principal. Contracts should be executed when first payment is made and a deed executed when the final payment is made.

ALTRUISTIC

"Some want the rich to divide their property."

"I gotta little tract out near here," said the real estate man, "that I'm willing to subdivide for the benefit of the public."

NO HARM MEANT

A few days after a farmer had sold a pig to a neighbor he chanced to pass the neighbor's place and saw the neighbor's son sitting on the edge of the pigpen, watching the new occupant.

"How do you do, Johnny?" said he. "How's your pig today?"

"Oh, pretty well, thank you," replied the little boy. "How's all your folks?" —Exchange.

WITHOUT INTERRUPTION

"Is she really so curious?"

"Curious? Why that woman would listen to advice."

German papers say that Theodore Roosevelt was the "arch enemy" of Germany. This is the most complete and wholly satisfactory eulogy that has yet been uttered.

His Answer to Shortage of Help

A G-E Motor on practically every hard job on the farm.

Electric service means "horsepower" instead of "man power."

Electric power brings abundant crops, more leisure, greater profit and lighter labor.

When Writing Advertisers, Mention the Cultivator.

Is It True?

By Jay Dutter

IS IT true that cooperative marketing of farm products increases the cost of living? Certain newspapers throughout California have for months past been attacking farmers' cooperative associations for being profiteers, accusing them of being trusts formed in the restraint of trade, accused them of destroying food products in order to sustain high prices.

Can you remember ever having seen a farmer burn his wheat crop or part of it to help keep prices up, or let some of his stock die from want of care in order to shorten the meat supply so he could get higher prices for some of his products?

The dairymen of Northern and Central California have been accused of pouring milk down the sewer in order to hold up prices of milk. Did you ever hear of anything more unlikely?

Up to the beginning of this generation the farmer has been at the mercy of the buying public, regardless of the frantic denials of independent buyers and profit making concerns, and because of the unfair methods of many of the buyers and commission men the farmer in sheer desperation was compelled to save himself by entering the selling and manufacturing field.

The orange growers blazed the way in California for all the other cooperative associations and have made an unqualified success because of good business methods. They were followed by other specialized branches of farming industries, nuts, deciduous fruits, grains, etc., all of whom have achieved more or less success.

Last of all, came the dairy industry. Then, Ouch! up went an awful wail; someone's toes had been stepped on. Several great firms who had always (?) given the farmer a square deal, paying him at least half, and sometimes even a little more, than the value of dairy products, found that a large percentage of their business had vanished over night. This was robbery pure and simple; they had no right to go into the selling and manufacturing business for themselves.

These firms had for years had a monopoly of the business; they had invested millions in it, were making millions out of it. As one man from one of our northern cities said in talking against one of the associations: "Those fellows don't know anything about the business of running a creamery. You fellows are foolish to join an association. I am a big stockholder in the ——— Creamery Company and have made over $60,000 in the business in two years, and I know." Well, let us give him some credit—he must have known something. If one man made that much out of the creamery business, let us have some pity for the patrons of that very large creamery.

The assertion is made that there are enough manufacturers in the field, enough buyers, no more plants needed, that the dairyman should mind his own business and keep out of the game and attend to his dairy, that it is no business of his what the creamery products might bring, nor what the by-products are worth, nor what they are. In some of the smaller industries the farmer was opposed in the same way, but not so strenuously as the dairymen. The milk business was too big to let slip, hence the big fight.

The claim has been made that the Associated Dairymen are to blame for the high cost of milk in the city; yet the press that are so loud in their claims against the so-called milk trust fail to state through their columns that no cities in the United States in the same class as the cities of California have cheaper milk, and most of the large Eastern cities have much higher priced milk. The dairy associations do not increase the price of milk because of their manufacturing operations, and there is no reason for raising a howl because they wish to engage in the manufacture of by-products of milk.

I will offer a parallel instance which should to any sane reader show why the dairyman's activities should not have any effect on prices to the ultimate consumer but only on the pocketbook of the middleman.

In the little inland town of Hemet, Riverside County, there is in successful operation a cooperative fruit cannery, owned and operated by the farmers, known as the Hemet-San Jacinto Growers Association, Inc. Five years ago they organized because they had their backs to the wall, no market for their fruit, debts unpaid. They gave their notes, borrowed money and built a modern factory. Today they have a plant representing an investment of $130,000 nearly paid for, and this year they are paying their members net per ton for apricots $104; for cling peaches $96 average; for grade A apricots $145; for grade A cling peaches $125.

The writer having traveled nearly all over the state this year, has ascertained that many, in fact, most of the canneries, paid an average price of less than $60 for 'cots, and $40 for best grade of peaches.

This does not mean that the growers association gets more for its pack; they sell for the same prices as the independent packers. The consumer may say: "They should sell it to us cheaper, if they make so much more money." Does that follow? Is it human nature to offer your products for less than the other fellow, just for the sake of being philanthropic?

But the farmers association will do this. By securing better returns for its members it will so encourage production and stimulate pride in manufacturing and selling of the finished product that ultimately prices will lower.

Col. Harris Weinstock had the right idea, that encouragement of the farmer, rather than exploitation, would so encourage production, that ultimately the consumer in the city would reap the benefit as well, and the sooner city people come to realize this fact and stop listening to the paid publicists of manufacturing interests, the sooner will the goal of lower prices be reached.

To be sure, most farmers are now making some money. We often hear from the city man: "All the farmers have their automobiles." Very true, the farmer must save time. Does the farmer deny the city man his auto, or his social life in general? The more pleasant the life of the farmer is made the more he will be encouraged to stay on the farm and produce. Grind him down to the last penny of profit and try to make him a drudge, and the city will become so thickly populated that the farms cannot support them. The farmers will not produce crops unless they are paid well and can enjoy some of the fruits of their industry.

True cooperation is the modern method of reaching the market at lowest cost, and all over this great republic the farmer is beginning to realize it and come into his own, and the sooner the big manufacturer wakes up and starts to cooperate with him the better it will be for their investments.

FREEDOM

Those who deny freedom for others deserve it not for themselves and under the rule of a just God cannot long retain it. We must make this a land of liberty in fact as well as name. Let us appeal to the sense and patriotism of the people and not to their prejudices. Let us spread the floods of enthusiasm aroused here over all the vast prairies so suggestive of freedom. There is both a power and magic in popular opinion. To that let us now appeal, and, while in all probability no resort to force will be needed, our moderation and forbearance will stand us in good stead when, if ever, we must make an appeal to battle and to the God of hosts.—Abraham Lincoln.

The farmer only wants his share and a square deal.

Since the dairymen have organized, several large manufacturers of dairy products have started building manufacturing plants in the state and no one has raised an objection. But every time an association starts a new building the vested interests set up a roar and start attacking the officials, which is their only hope. They dare not attack the system nor the members themselves, so they try by accusation, innuendo and subterfuge to vilify the intentions of the directors and officials of the associations, hoping thereby to alienate the members and sow the seed of distrust in their minds, but more and more the dairymen see the light, and they will stand pat.

BUSINESS FARMING

We recently received the following hints from a business house which handles office equipment. They looked like an ad, or rather had suggestions of advertising leanings but really the suggestions have good business sense in them. Doing your best you can't find an ad.

So farmers may read and profit by the suggestions of a business man.

* * *

In the last few years farm methods have been revolutionized. Better roads, more railroads, the automobile, the tractor, the cream separator, the telephone, the farm lighting plant and other labor saving and time saving improvements have done away with the old, tedious methods. The farmer is no longer isolated from the outside world. He can have on his farm almost all the conveniences and advantages that his city brother can have and a lot more that his city brother cannot have.

Farmers are applying scientific farming in the field. They understand crop rotation, stock breeding, deeper plowing, soil exhaustion. They are getting greater and greater returns from their acreage by intensive cultivation. They keep pace with the latest discoveries and inventions of agriculture and stock raising. They are in close touch with market conditions. They are keenly interested in the cost of transportation.

Yet many of them do not put that same efficiency into their office work. For every modern farmer is compelled to do a certain amount of office work. He has to do a lot of things that his father did not have to do. The government insists that he keep sufficient records so as to make correct returns on his income tax. He is transacting more and more of his business by mail. No merchant, no lawyer, no manufacturer—no man needs a typewriter more than a farmer.

The core of a business office is a typewriter. The typewriter is becoming the business partner of the farmer of today. Every letter a farmer writes should be a silent compliment to the business efficiency which he is employing as a business man. It should be clearly written and easily read. It should be written on a letterhead.

Carbon copies should be kept by the farmer of all letters, agreements, orders, memoranda, cost entries, instruction sheets—all paper which must be read by another without mistake at a time when correct, easy reading is important. These are recognized requirements in a business office which the typewriter furnishes.

You may think it difficult to operate a typewriter—that it requires long months of practice before presentable work can be produced. Such an impression is erroneous. Hundreds of farmers are handling their own correspondence and office work with a typewriter. Most of them learned as beginners with the instructions furnished with all typewriters. It is really a simple matter.

SCARE OFF THE LINNETS

A farmer from Iowa came to California to retire, but had to have a garden patch to while away the time. A nice house was built and a good garden planted, including some strawberries. But alas, he did not count on the linnets getting all the fruit.

But he had some ingenuity. A wire was stretched extending over the strawberries. On this were suspended a number of tin pails with a few stones in them. Then another wire was attached to the middle of this and carried to the kitchen window.

The housewife did the rest. Whenever she saw any linnets in the berries a pull on the wire made such a racket that the linnets took flight. In a few days the linnets had acquired such an aversion to that particular garden that they left it for good, and plenty of berries ripened, to the delight of the family.—E. L. Koethen.

BOSTROM IMPROVED

Shipping weight 15 lbs. **Price $22.50**

Has TELESCOPE with magnifying glasses which enable you to see cross on Target quarter of a mile. Pays for itself on the first job of

IRRIGATING, DITCHING, TILE DRAINING, TERRACING, etc.

Best investment any land owner ever made with Twenty-Two Dollars and Fifty Cents. Simple, accurate, durable and complete with full instructions. Used and endorsed by Agricultural Schools, County Demonstration Agents, and farmers from Atlantic to Pacific, and you will endorse it too, after using it—if not your money back.

Write for description of Level and TELESCOPE, details of money back guarantee; also name and address of our distributor in your section.

BOSTROM-BRADY MANUFACTURING CO.
89 Stonewall Street, ATLANTA, GA.

Place Your Order NOW for Nitrate of Lime

Guaranteed not less than 13 per cent Nitrogen—almost 100 per cent Pure.

Nitrate of Lime supplies Nitrogen in the most available form. Packed in solid wooden casks about 240 pounds.

Ask for prices, delivery from warehouse, Los Angeles and San Francisco, or steamer, January, 1920.

O. HENRY SMITH, General Agent
Pacific Coast and Hawaiian Islands
311 California St., San Francisco.

25 Cords a Day

Easily Sawed By One Man. Easy to move from cut to cut. Make big profits cutting wood. Cheap and easy to operate.

OTTAWA LOG SAW

Does 10 men's work at one-tenth the cost. Makes work easy. Engine can also be used for running pumps and other machinery. Saw blade easily removed. Write for our low price. Cash or Easy Payments.

Ottawa Mfg. Co.
2749 Wood St.
Ottawa, Kansas.

DEPARTMENT B

ANGLO-CALIFORNIA TRUST COMPANY BANK

SAN FRANCISCO

Preserve Your Strength by Attaching a
NATIONAL BACK REST

To the seat of your tractor or farm machinery. It saves your back and you rids in comfort. The National Back Rest fits on nearly any seat no matter what style or shape, it can be quickly and easily attached without the use of tools. No screws or bolts. Will not slip off. Three dollars delivered. Some agency territory still open. Satisfaction guaranteed or money refunded.

CARL G. JORN
Jorn Bldg., 57 Plaza Square, Orange, California

Camarillo, Cal.
Hercules Powder Co.
San Francisco, Cal.
Gentlemen:-
In planting something over two thousand orchard and ornamental trees, it was thought advisable to use your dynamite where severe hardpan was encountered. This method not only greatly simplified the digging of the holes in which the trees were to be planted, but the trees themselves bear a marked evidence of the benefit of planting. Without exception those trees planted in the worst hardpan formation, show a more vigorous growth than the ones in the best soil where shooting was not employed.
Very truly yours,
(Signed)-C.C. Perkins.

"That's the Way They Talk"

"Here's a letter from C. C. Perkins of Camarillo, California. *Read it* and see what *he* thinks of

HERCULES DYNAMITE

"Sign the coupon and mail it today. The Hercules Powder Co. will send you free a copy of 'Progressive Cultivation'. This tells you all about the use of dynamite on the farm and in the orchard.

Send today for this book—*You need it.*"

Hercules Dynamite is for sale at leading dealers.

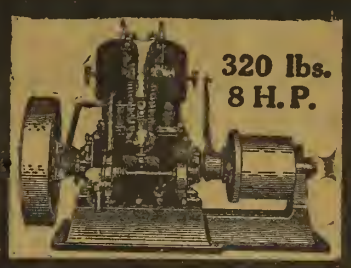
More Power Per Pound

CUSHMAN

Original Light Weight Power



The Cushman is the original lightweight, all-purpose farm engine. Unusual care in design; higher standards in all manufacturing processes; perfected balance, and refinements in ignition, carburetion and lubrication enable Cushman Engines to deliver more power per pound.

This is why Cushman Motors weigh only 40 to 60 pounds per H. P., depending on size, yet afford as much power and even more general efficiency than is possible with engines of the old type weighing three or four times as much.

Cushman Motors do all stationary jobs, even more satisfactorily than ordinary engines, and also may be attached as power drive to machines in the field, such as harvesters, hay presses, corn binders and pickers, potato diggers, etc.

Cushman "Does More"
Electric Light and Power Plant

It does more for the farmer than any other outfit—combining both an Electric Light Plant and a Portable 4 H. P. Power Plant in one outfit, at practically the cost of an electric light plant. Equipped with the famous Cushman Engine and Cushman Self-Starter. Ask for Book on Cushman Light Weight Engines or Cushman Light Plants—whichever desired. (309a)

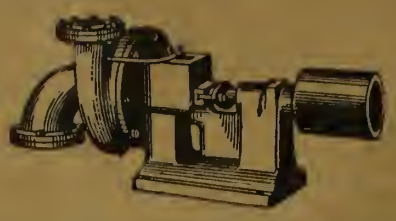
End Pump Troubles



—See how this Pump does it.

THE "Bean" Universal Pump—belt driven—eliminates pump troubles. It's a twenty-year development, the ultimate in centrifugal design.

Stuffing box troubles are minimized by a perfect water seal. The shaft where it enters the case is ever completely surrounded by a water bath.

The danger of loss of priming is minimized. And you don't have to cinch the packing down so tight that you cut the shaft.

We designed this pump especially to overcome these trouble sources.

Then we added all the other advantages in pumps that our experience of 20 years evolved.

The result is the perfect pump. Don't overlook it in making your selection.

Hundreds of men who have examined all kinds are putting in the "Bean." Let their decision guide you.

(Clip Out and Mail)

Distance to water below surface of ground.....
Probable distance to water when pumping.....
If water is to be raised above surface of ground, how high? (Length and size of pipe line).....
Volume of water desired (Gals. per min.).....
(Inches) .....
If you have pit, give width..... length.....
depth.....
H. P. of motor or engine if you have that equipment.....

Automatic Water Balance

The "Bean" is provided with automatic water balance and an extra heavy outboard bearing which is oversize. It gives insurance against vibration. Belt changes are easily and quickly made.

It is strongly braced. An extra web of metal between sealing bowl and outboard bearing protects against excessive strain.

In fact, if you want the best pump of this type you have little choice, for that pump is the "Bean."

"Bean" Universal Pump—Belted

Send coupon for all the facts about this modern pump. Don't buy a pump until you know all the points wherein the "Bean" excels. That is the way to insure satisfaction when you buy a pump.

White: Cooking (in 50s), 15@16; choice (in 50s), 17@18; exta choice (in 50s), 19@20; fancy (in 50s), 21@22; extra fancy (in 50s), 23@24; bricks, 12 No. 10s, 1.60@1.67½; bricks, 24 No. 8s, 2.55@2.65; bricks, 50 No. 6s, 4.00@4.15; bricks, 70 No. 4s, 4.20@4.35; layers, No. 10, 2.50@2.80. Calimyrna: Cooking (in 50s), 19; choice (in 50s), 23; extra choice (in 50s), 24; fancy (in 50s), 26; extra fancy (in 50s), 27½; bricks, 10 1-lb., 2.75; layers, No. 10, 2.95@3.20. Black: Standard 14, choice 17@18; extra choice, 18@19; fancy, 19@20.
Pears:
Standard 20, choice 22½; extra choice, 24; fancy, 26@27.
Raisins:
California Associated Raisin Company's prices guaranteed to January 1: Seeded: Sun-Maid, 16s, package, 15; fancy, 16s, package, 15; fancy, 12s, package, 11¾; choice, 16s, package, 14½; choice, 12s, package, 11⅝; bulk, fancy in 25s, 14¼; bulk, bakers, in 25s, 13½; bulk, Malagas and Feherzagos, in 25s, 13. Loose Muscatels: 4-crown, in 25s, 14¼; 3-crown, in 25s, 13¾; 2-crown, in 25s, 13¾; 1-crown recleaned, in 25s, 14. Seedless: Thompsons, 16s, 15½; Thompsons, 12s, 12¼; Thompsons, bulk, recleaned, in 25s, 14¼; Thompsons, bulk, bakers, in 25s, 15½. Bleached Thompsons: Choice, in 25s, sulfur, 18; fancy, in 25s, sulfur, 18½; extra fancy, in 25s, sulfur, 21; soda dipped, in 25s, 17¾; oil dipped, in 25s, 17¾. Sultanas, 16s, 15¼; Sultanas, bulk, in 25s, 14¼. Layers: 6-crown, flat pack, 20s, per box, 4.05; 6-crown, flat, 10s, per box, 2.20; 6-crown, flat pack, 5s, per box, 1.20; 4-crown, flat pack, 20s, per box, 3.20; 4-crown, flat pack, 10s, per box, 1.75; 4-crown, flat pack, 5s, per box, 1.00; 3-crown, tray pack, 20s, per box, 3.10; 3-crown, flat pack, 20s, per box, 2.95; 3-crown, flat pack, 10s, per box, 1.60; 3-crown, flat pack, 5s, per box, 95; clusters, 30-1s, cartons, 3.45; clusters, 12-2s, cartons, 3.80; clusters, 4-5s, cartons, 4.50; vineyard run, 100s, 13.00.

GRAIN

Wheat: The prices are based upon federal grades and standards at the terminals in San Francisco Bay and Los Angeles, and are as follows, per bushel of 60 pounds:

Hard White—	Per Bushel	Per Cental
No. 1	$2.20	$3.66 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.18	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51⅓
Club and Sonora—		
No. 1	$2.16	$3.00
No. 2	2.13	3.55
No. 3	2.09	3.48⅓

The above are minimum prices.
For sacked grain add 4½ cents per bushel of 60 pounds to above prices. Deductions of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.
Oats: Red feed, 3.30@3.35; black, 3.50.
Corn: California yellow, 3.15@3.25 per cental; Egyptian white, 3.75@3.80; milo maize, 3.25@3.30.
Barley: Spot feed, per cental, 3.60@3.65; brewing, 3.65@3.75.

HAY

Under date of January 31, Scott-Magner & Miller says:
Receipts past week, 1,058 tons. The falling off in receipts during the week possibly was caused by government contracts being mostly filled and the heavy demand throughout the interior requiring immediate shipments which have prevented hay from finding its way to this market. The lack of rain has caused heavy feeding of baled hay in all districts. Large quantities of alfalfa are being moved into this state daily. Without rain shortly, we look for higher markets.
sion and handling expenses are to be added according to conditions:
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses are to be added according to conditions:

Fancy Wheat Hay (light 5 wire bales)	29.00@31.00
No. 1 Wheat or Wheat and Oat Hay	26.00@30.00
No. 2 Wheat or Wheat and Oat Hay	25.00@27.00
Choice Tame Oat Hay	28.00@31.00
Other Tame Oat Hay	25.00@28.00
Wild Oat Hay	24.00@27.00
Barley Hay	24.00@27.00
Alfalfa Hay	26.00@31.00
Stock Hay	21.00@24.00
No. 1 Barley Straw, ton	.50@ .80

Citrus Markets

Los Angeles, February 4, 1920.

The demand for oranges has been quickened and a slightly better market prevails. Weather conditions, however, in the Eastern centers have been unfavorable to moving the fruit. Some independent buyers in California are offering around four and four and a half cents per pound for Navels and three and a half for seedlings.
California lemons have been given a great boost by the return of the flu epidemic. The demand has caused an advance which is almost spectacular. Best grade lemons are now often commanding around $8.

Shipments

Shipments of oranges to date from Southern California since November 1, 1919: 5,675 cars; lemons, 1,169; total, 6,844. To same date last season: Oranges, 4,913; lemons, 1,698; total, 6,611. From Central California this season: Oranges, 3,419; lemons, 164; total, 3,583. To same date last season: Oranges, 2,205; lemons, 211; total, 2,416. From Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

Philadelphia: 1 or. Nav., 3.40@4.35.

MARKET NOTES

The most notable change in the shipping market during the past week has been demoralization of lettuce prices, now quoted at $1.30 to $1.50 a crate, a drop of 50 cents or more from last week, with no hope of the future. On account of extreme cold weather in the east the markets are glutted and dealers at this end refuse to ship as returns will not pay the freight. A few are culling closely and shipping extra fancy only. During past week Imperial Valley has shipped 30-50 cars daily, now stopped.
In the local market potatoes are very dull, owing to action of "fair price committees" and boycotts, though prices hold fairly well, running but 25 cents to 50 cents a hundred less than week ago. In normal season 18-20 cars would move in a day, at present that is the volume for the entire past week. Onion market a little stronger and for first time this season whites are quoted higher than yellows or browns.

DORMANT SPRAYING PAYS
Dormant spraying, it has been proved, is the most successful means of controlling many injurious diseases and insect enemies. Fruit trees at this time, devoid of foliage, are hardened for the winter and can withstand applications of strong sprays.
Universal Brand Crude Oil Emulsion
properly applied, prevents the accumulation of insect and fungus enemies. It keeps the trees in better health, vigor and fruitfulness. It cleans the trees and disinfects bark wounds.
Crude Oil Emulsion is the best of the dormant sprays — made for this purpose. Place your order with us for your supply—today.
And send for your copy of our bulletins on deciduous spraying. A post card brings it—today.

Diamond Bar Durocs at Record Prices

Pacific Coast records tumbled one after another when the largest crowd that ever attended a California auction sale paid an average price of $420.30 for 35 head of Duroc-Jersey bred sows and gilts at the Diamond Bar Ranch sale, January 28. The average price registered is not only a new coast record for public sales of pure bred hogs, but the top, $1,500, is the highest ever paid for a Duroc-Jersey sow or gilt at auction in the West.

By this sale California Duroc interests made their debut into big league company and indicated that California breeders are willing to pay full values for breeding material when the opportunity is provided to select blood lines that are popular and coupled with desirable individuality.

A long story could be written about the Diamond Bar sale. The ranch itself, the extensive equipment, the mammoth hog barn, the feeding system, the small locomotives, the tracks and feed cars, the hundreds of Durocs from which the sale offering was selected are all a part of the story, but space does not permit such extensive reference.

Long before the sale the parking space for automobiles reminded one of a fair, and by lunch time over 1500 people had registered. After the barbecue lunch, the sale opened with every seat in the large tent occupied—many of the visitors were tourists from the cornbelt states who, a bit homesick, perhaps, had come to see a California sale, but the majority were representative breeders.

After a brief talk, Ord L. Leachman of Sacramento, called for bids, and while at times, the going was slow, the 35 head were taken at highly satisfactory prices. The sale made plain a keen desire on the part of our breeders to introduce into their herds the blood that is popular in the East and because the Diamond Bar herd boars, Ace of Pathfinders and Mammoth Sensation Jr, provided that blood, the better things carrying their services were quickly taken.

The top of the sale was $1,500, at which figure J. P. Walker of Visalia secured the outstanding senior yearling, Orion's Crimson Lady, sired by Creator and bred to Ace of Pathfinders. This young sow represents to a marked degree the present day standard and her selling price can be rated as conservative.

Pathfinder's Perfection, a junior yearling daughter of Pathfinder, was taken by Fred B. Ellis of Lindsay at $1,025, the top for the catalogued sows. Sensation Belle was purchased on order for Hanks & Bishop, New London, Iowa, for $700, and the same amount was paid by J. P. Mallory, Fresno, for Willetta of Idlewild. Pal's Gano went to Lawton & Walker, Fillmore, at $600, and Elliott-Brant Ranch, Owensmouth, paid a like amount for the Mumford bred sow, Starlight of M The top ten head averaged $709.50.

The sale was a credit to the owner, F. E. Lewis, II, the manager, Walter Gatton and to Col. Leachman. A detailed report follows:

1, Fred B. Ellis, Lindsay, $1025.
2, Carroll Gates, Los Angeles, $310.
3, Lawton & Walker, Fillmore, $600.
4, H. A. Ludwig, Downey, $500.
5, D. G. Cummins, Goshen, $450.
6, Walter A. Lewis, Pomona, $350.
7, Elliott-Brant, Owensmouth, $600.
8, Charles Ellis, Visalia, $310.
9, J. P. Walker, Visalia, $360.
10, Hanks & Bishop, New London, Iowa, $700.
11, Mong & Charleston, Whittier, $250.
12, Mrs. R. E. Whitley, Van Nuys, $440.
13, Fugler & Perkins, Santa Maria, $460.
14, Fred O. Sargeant, Whittier, $505.
16, W. H. Morrow, Downey, $370.
17, Lawton & Walker, $285.
18, J. K. Atwater, Riverside, $505.
21, Carroll Gates, $240.
22, Carroll Gates, $305.
23, Ireland Ranch, Owensmouth, $400
25, J. P. Mallory, Fresno, $700.
27, Lawton & Walker, $290.
28, Orris & Padgham, Gooding, Idaho, $150.
29, Lawton & Walker, $160.
30, H. A. Ludwig, $140.
31, Lawton & Walker, $175.
32, Winsor Ranch, Bonita, $150.

Winsor Sale a Real One

The sale of 40 Duroc-Jersey sows and gilts, held by Winsor Ranch, Bonita, at Exposition Park, Los Angeles, January 29, must be rated as one of the most successful sales ever held in this state. Practically all the offering was bred by the sellers and the average of $344.75, with only five head selling for $500 or more, a top of $875, and only two gilts selling under the $200 mark, is a striking demonstration of the uniformity and high quality of the offering and the ability of R. K. Walker, the manager.

Few if any sales have been held in the West that presented a more uniform or attractive lot of breeding material, and the eager manner in which the offering was absorbed should be a source of high satisfaction and encouragement to the sellers even though no records were established. The top of the sale, $875, was paid by D. C. Cummins & Son of Visalia for Golden Sensation, second prize under year gilt at the 1919 state fair. Mong & Charleston, Whittier, got a good buy in a daughter of Great Wonder I Am at $575. E. C. Witt, Lankershim, paid $525 for Sensation Rose Again. L. R. Hitchcock, Van Nuys, took a daughter of Great Model, bred to Winsor's Giant Orion, at $525 and C. D. Crouch of San Diego, paid the same amount for Bonnie Model.

Aside from the sales mentioned most of the consignment sold near the average for the sale. E. S. McClure of Perris, secured splendid values in the two May gilts by Great Orion Sensation.

Col. Leachman conducted the sale in a very satisfactory manner.

The sale list follows:

1, D. C. Cummins & Son, Visalia, $87
2, Elliott Brant Rancho, Owensmouth, $350.
3, Ireland Ranch, Owensmouth, $385.
4, Mrs. R. A. Whitley, Van Nuys, $38
5, Mong & Charleston, Whittier, $385.
6, Southwest Cotton Co., Phoenix, Arizona, $400.
7, Geo. C. Aydott, Hanford, $310.
8, J. C. Craig, Los Angeles, $250.
9, Ordway & Snyder, Hughson, $275.
10, Leest & Mounier, Van Nuys, $28
11, Chaffey Union High School, Pomona, $285.
12, Ireland Ranch, $325.

(Continued on Page 222).

Combination Sale, One Too Many

It was perhaps too much to expect that the comparatively limited buying power of Southern California Duroc interests could absorb three sale offerings in three days—at any rate the Ireland Ranch-Graham-Newton combination sale held at Ireland Ranch, January 30, suffered somewhat through a lack of support from the Southern breeders, and the average of $194.64 on the 28 sold represents conservative values compared with the preceding sales.

This sale constituted the first event of the kind ever held in the San Fernando Valley and the local ranchers, for the most part, seemed to regard it more as an occasion to meet and visit than an opportunity to increase the efficiency of their hogs. However, the consignors were game and showed their sportmanship by sending forward every lot that could be taken by the small crowd. Buyers from a distance who were represented by mail bids secured some excellent values.

Dr. Creamer sold the top sow, Ireland's Model Lady, to Mrs. Whitley for $500 and the 17 head consigned by him averaged $206.50.

Four gilts from Donald H. Graham's herd averaged $262.50 and six young gilts from Dr. Newton's consignment made an average of $131.66.

Ord L. Leachman of Sacramento was the auctioneer, the following animals sold:

Consigned by Ireland Ranch, Owensmouth

1, Fred B. Ellis, Fresno, $350.
2, Charnock Ranch, Hemet, $250.
3, E. F. Meyers, Lankershim, $400.

Chas. Gatewood's Poland China Sale

The dispersion sale of Chas. Gatewood's Poland China herd was held in Fresno, February 26. The entire offering of 68 head was sold by Col. Bell in less than three hours for a total of $15,325, making an average of $225.35 for the entire lot including a number of young unbred gilts. The outstanding feature of the sale was, of course, the sale of Giant Bob, the grand champion boar at the last state fair. For several months there has been much speculation as to who would be the new owner of Giant Bob, but it is doubted if any made the right guess. He was purchased by Z. M. Dickey, Dinuba, and H. Buckland and Son, Fresno, for $5,250. Mr. Dickey is one of the younger breeders and has recently established the Sequoia herd of big type Poland Chinas on his ranch near Dinuba. A. Buckland and Son are well known and maintain one of the leading herds of the state. They recently purchased Golden West King, grand champion at the California International Livestock Show, so that in these two herds are found the grand champion boars at two of the state's biggest livestock shows. Mr. Dickey also secured the top sow of the sale, paying $600 for Forestview Anna 4th. Other heavy buyers were C. E. Dack, Fresno; Fred Gatewood, Fresno; J. Hall, Kerman, while the entire offering was practically absorbed by the breeders. Following is detailed report of animals selling for $100 or more:

BOARS

1, Giant Bob, Z. M. Dickey, Dinuba, and A. Buckland and Son, Fresno, $280.
2, Prospector, E. S. Meyers, Riverdale, $350.
3, Gatewood's Prospect, J. Hall, Kerman, $325.

SOWS

4, C. E. Dack, Fresno, $235.
5, Z. M. Dickey, $600.
6, C. E. Dack, $390.
8, M. Lovelace, Lemoore, $195.
10, C. E. Dack, $115.
11, F. Gatewood, Fresno, $105.
12, J. Hall, $105.
13, H. I. Marsh, Modesto, $225.
15, M. Lovelace, $190.
17, M. & A. L. Bassett, Hanford, $115.
18, J. Hall, $135.
19, W. L. Haag & Son, Hanford, $200.
20, R. F. Guerin, Visalia, $295.
21, C. E. Dack, $140.
22, C. B. McNeil, Fresno, $225.
23, F. D. Ross, Hanford, $285.
25, J. H. Cook, Paradise, $115.
27, M. & A. L. Bassett, $145.
28, M. Lovelace, $180.
29, F. Gatewood, $550.
30, C. E. Dack, $300.
31, C. E. Dack, $140.
33, Hugh Shinn, Tulare, $125.
35, B. S. Cole, Hanford, $120.
36, W. L. Choisser, Riverdale, $155.
37, Les McCracken, Ripon, $100.
38, C. E. Dack, $125.
46, C. E. Dack, $110.
47, H. I. Marsh, $105.
49, Thos. Caesar & Son, Reedley, $135.
50, H. I. Marsh, $125.
51, H. I. Marsh, $125.
52, W. D. Trewhitt, Hanford, $180.
53, Hugh Shinn, $155.
54, F. Gatewood, $120.
55, W. C. Ficklin, Fresno, $175.
58, A. J. Van Gleef, Riverdale, $170.
60, J. Hall, $140.
61, C. B. McNeil, $350.
62, H. I. Marsh, $235.
66, B. S. Cole, $135.

MARSH'S POLAND CHINA SALE

Hale I. Marsh held a very successful sale of Poland Chinas on his farm, near Modesto, February 28. Mr. Marsh has recently completed a circular farrowing house, and this was turned into a sale pavilion which afforded a warm and comfortable place for the holding of the sale. The top of the sale was the full yearling, Miss Model Improved, by Model Major, selling to M. B. Houk, Winton, for $235. The average for the sale was $130. Geo. W. Bell, Tulare, was the auctioneer. The following sold for $100 or more:

1, Cy. N. Clark, Jr., Modesto, $155.
4, L. Snyder, Modesto, $100.
5, Ratto Stock Farm, $200.
6, N. K. Horan, Lockeford, $115.
7, J. O. Martin, Atwater, $100.
8, R. F. Guerin, Visalia, $130.
10, J. Gibson, Modesto, $150.
12, N. K. Horan, $220.
13, N. K. Horan, $170.
14, Z. M. Dickey, Dinuba, $100.
15, C. N. Clark, Jr., $100.
16, Les McCracken, Ripon, $100.
17, M. B. Houk, Winton, $235.
20, N. K. Horan, $125.
21, N. K. Horan, $125.
22, McCarty & Starkweather, Modesto, $125.
24, J. O. Martin, $120.
29, Z. M. Dickey, $100.
30, M. L. Harmon, Denair, $100.
31, N. K. Horan, $125.
39, N. K. Horan, $150.
40, H. C. Harmon. $115.

J. T. Sullivan of Meadow Gold Dairy, says: "I challenge anyone to produce a finer field of alfalfa than I raised from Germain's Proven Hairy Peruvian Alfalfa Seed. This variety cannot be praised too highly. It does all you claim for it — and then some." Read the rest of Mr. Sullivan's letter in our free booklet. It contains 30 signed letters from farmers and dairymen who have tested this wonderful alfalfa seed.

The Mark of Farm Supremacy

is found where Duroc-Jersey Hogs are Raised. Make Your Farm a Duroc-Jersey Farm

50 — Bred Sows and Gilts — 50

will be sold by the

Tulare County Duroc-Jersey Breeders Association

Sale

Thursday, Feb. 12, 1920, in Tulare, Cal.

THE DUROC-JERSEY

is the great American hog. A prolific, easy feeding, quick maturing animal. That's why you find more Durocs on the farms than any other breed. The blood of our greatest Durocs will be found in this sale and this sale affords you a great opportunity to start and start right. More important still is the rapid manner in which they increase farm profits. Sale will be held in new sale pavilion, Tulare, Calif. Geo. W. Bell, auctioneer.

Sale at 12:30 P. M. Lunch at 11:30 A. M.

Next Thursday is the day. Tulare is the town. Come and buy a Duroc.

When Feed Is Scarce and High

The Owner of Whitefaces Smiles

Not because of scarcity and high prices, but because he knows that under these handicaps he has the best cattle possible for him to own.

Unsurpassed by any breed under normal feed and range conditions, HEREFORD CATTLE stand out in a class by themselves, during the periods of drought, scant range, or winter hardship, a fact that has been demonstrated year after year on some of the world's greatest ranges, as well as on thousands of smaller holdings.

Since their invasion of the west, HEREFORDS have increased steadily and rapidly in popular esteem, as progressive cattlemen have had opportunity to observe their actual performance under various conditions, and through sheer merit the excellence of the breed has created a demand for pure bred registered breeding HEREFORDS far in excess of the available supply.

One of the good opportunities to purchase registered pure bred HEREFORDS will be made possible by Pacific Coast breeders at

University Farm, Davis, Cal.
Tuesday, February 24, 1920

when they will offer an unusually well bred lot of cows, heifers, and bulls.

THE FEMALES will include drafts from many of the most substantial western herds, and a large number will be safe in calf to the high class sires now in service, presenting to the beginning breeder an opportunity for wise selection of foundation females.

THE BULLS will be an especial feature of the sale, as the breeders will make a real effort in this offering to make available to owners of range herds a class of bulls that will breed HEREFORD quality into their herds in a marked degree.

Write for catalog of sale. Detailed announcements will appear in later issues.

FIRST BERKSHIRE SALE NEXT WEEK

The first sale of Berkshire swine to be held in the 1920 season will be held by J. Francis O'Connor, Castleview Ranch, Santa Rosa, Saturday, February 14. This sale will also be the first sale ever held by an individual breeder in Sonoma County.

Mr. O'Connor is only selling 25 head of sows and gilts, but in view of the fact that he has listed Rookwood Lady 100th, the only grand champion of a National Swine Show owned in California, wide interest has been created and much speculation as to whether that great sow will remain in California or be taken East.

The Castleview herd has been prominent at the recent livestock shows and fairs and has been very successful with entries in the barrow contests.

NEW BERKSHIRE ORGANIZATION

Berkshire breeders in Southern California held a meeting Saturday, January 31, at the ranch of the Italian Vineyard Company and formed the Southwestern Berkshire Congress. Alex M. Wilson of the Italian Vineyard Company was elected president; Rowe Sanderson of Los Angeles, vice president, and C. Jack Zinn of Inglewood, secretary-treasurer. Including the officers named the following breeders will serve on the board of directors: F. P. Hall, Perris; Mrs. F. M. Connor, Pasadena; D. J. Bastanchury, La Habra, and Geo. A. Stengel, El Monte.

The new association plans to hold a consignment sale at Clearwater, Saturday, February 21, and it is expected that a number of the breeders in Northern California will consign, as well as E. J. Barker of Thorntontown, Indiana.

LOS ANGELES LIVESTOCK SHOW

At a meeting of the board of directors of the Los Angeles Livestock Show held January 29, October 2 to 10, 1920, inclusive were the dates chosen for holding the third annual Los Angeles Livestock Show.

Nothing will be left undone to make this show surpass any show yet held in the West and premiums to the amount of approximately $50,000 will be hung up.

ORGANIZATIONS PROMOTED AMONG RANGE STOCKMEN

Regulated management of the national forest ranges during the past 14 years has had a marked influence on development of livestock associations. In 1917 there were 359 stock associations cooperating with the forest service. Last year there were 544, an increase of over 51 per cent. The old system, under which each holder of a permit gave individual attention to his stock while on the range, is being widely replaced by a pooling of interests along certain lines, accomplished by forming livestock associations, with advisory boards to handle many of the details of stock management.

Many associations employ herders for the stock while on the range, buy and distribute salt, in some cases buy bulls, and take charge of other management and improvement matters which promote the best interests of those holding permits and the highest use of the range.

The method employed is the adoption of special rules, passed by an association and approved by the forest service. Compliance with these rules is then required of all users of the national forest range. Practically all of the more progressive associations have adopted such special rules as meet the needs of their localities. Membership in the association is open to all livestock owners using the range, and a majority of all users must belong to the association in order to secure its recognition by the forest service.

In many cases advisory boards have recommended reduction in the number of stock upon a given range; they have also suggested changes in grazing seasons, with a view to securing the greatest benefits to the users and an improvement in the range. In practically all cases associations have interested themselves in constructing range improvements, such as drift fences; in water development, in the eradication of poisonous plants, and similar matters. Funds for improvements are obtained through assessments. Value of organized cooperation is most evident on range allotments where conditions of use are very intensive and the permitted stock belongs to a large number of small owners.

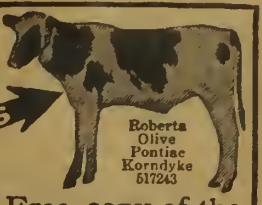
KNOWLEDGE OF PEDIGREES VALUABLE

Knowledge of pedigrees is of fundamental importance to the stockman, according to livestock specialists in the animal husbandry department of the Pennsylvania state college. The most successful breeders of pure bred stock know the history and performance of all the important animals of their breeds as well as they know their own relations and speak of them with a familiarity that surprises the uninitiated. To the man who does not keep pure bred stock, but who uses pure bred sires to improve his herd, a working knowledge of pedigrees is equally important. When he buys he knows what he is getting. He knows what families or lines will give him the characteristics desired. He knows when he can afford to pay a big price for an animal and when he cannot. When he sells he knows what price he should ask.

Familiarity with pedigrees keeps a man in touch with what is going on in the development of his particular kind of cattle, sheep or hogs. It also gives him a standing in the respect of other breeders. Here it is especially valuable to young breeders who have a reputation to establish. If they know what they are talking about when they are buying or selling an animal, the man with whom they are doing business will think more of their judgment, while they will have the knowledge which will enable them to make a good bargain. Nothing is more effective in advertising livestock than an intelligent display of the breeding and "good connections" of the animal in question. Time spent over the herd book is well employed.

TREAT Your Own Herd for **Abortion**

Stop Losing Calves! You can *wipe abortion out* of your herd and *keep it out.*



Send for Free copy of the *Cattle Specialist* with questions and answers pertaining to Abortion in Cows. Answers every question. Tells how to treat your own cattle at small expense. Write

Get Full Value From Your Feed

The time is here when you must make your feed bring you more dollars. Feeding by guess is an expensive experiment, so why guess, when you can know. The better article is usually a little higher but is much more profitable in the end. For more profits in swine feed Poland Chinas —the hog for profits.

Attend the First Sale

of Merced County Poland China Breeders Association

Merced, Saturday, February 21, 1920

40 Big Type Sows and Gilts

In this sale there will be daughters of such boars as **Cantrall's Ideal, President, King's Massive Orange, King's Timm, Big Bone Bob, Model Fellow, President's Equal, King's Big Bone Leader,** and, impress this upon your mind, they will be bred to Big Model Fellow, reserve grand champion at the 1919 state fair, Aviator, fast coming to the front as one of the state's leading sires, Whitten's Jumbo Timm, the good sire of P. E. Mitchell,'s King George Big Bone, 2nd prize senior boar pig at 1919 state fair showing against animals four to five months older and other good boars.

Attention Merced Farmers

We are especially anxious that these good sows remain in Merced County. We want to make Merced County a strong Poland China center. We want the farmers of Merced County to attend this sale and take home at least one good sow or gilt. There is not an animal in this sale but what will make you money.

Breeders Read This

We trust you will attend this sale and whether you buy or not, come and give us your moral support that we may make our county a great Poland China county.

Sale will be held at Cross Bros.' Ranch, adjoining Merced

Sale at 12:30 P. M. Lunch at 11:30 A. M.

ARE YOU A BUSINESS FARMER?

Then
You will be
Interested in the

Poland China Sows and Gilts

to be offered by the

San Joaquin County Poland China Breeders Ass'n

at Lodi, Thursday, Feb. 12

BECAUSE

The kind to be sold are the profitable kind. The offering has been selected from the best herds in the county—owned by practical farmer-breeders, who know the type and blood lines that make good under all conditions. The members of the association stand squarely behind every animal sold. There never was a time when good hogs could prove their value as under present conditions. There will be no better opportunities to select the right kind than will be provided by this sale.

40 Bred Sows and Gilts

Big Type---Size and Quality

12 Tried Sows:

These sows are just that—they have been tried and proven good producers in some of the best herds in the county. They are big, heavy boned, smooth, deep, motherly sows that represent very choice blood lines. Several of them have produced show winners. Any farmer, breeder or pig club boy can buy such sows for a foundation and be certain of producing the right kind of Poland Chinas.

15 Bred Gilts:

These gilts have been selected from the tops of the following herds: Geo. V. Beckman & Sons, N. K. Horan, J. F. Lehman, Langhorst Bros., Eugene Miner, John Boskovitch, Young & Barton and Young & Clark. A number of the gilts have show records, others are litter mates to prize winners and all are bred to the outstanding boars owned by members of the association.

12 Open Gilts:

The man who has his own good boar and needs a few outstanding brood sow prospects will not need to look farther than this sale. Among the lot will be found gilts that will look well in any herd in California. The type is right—the breeding is right.

San Joaquin County Poland China Breeders Ass'n

Ord L. Leachman, Auctioneer

Success in Breeding

depends largely upon your foundation. It demands type, conformation, early maturity and size. Our herd of Poland Chinas is typical of what you should desire in your own herd. We can supply one or more of this kind at reasonable prices.

Geo. V. Beckman & Sons **Lodi, Cal.**

THIS IS WHAT COUNTS

If you are raising hogs the quicker you can make 200 pounds of pork the more money you make. I breed Poland Chinas that mature quick.

BIG MODEL FELLOW—my herd boar was Reserve Grand Champion at last state fair. Buy a sow bred to this boar and secure both quick maturing and show qualities.

Bred sow sale, Merced, Feburary 21st.

J. F. McSwain **Merced, Cal.**

Better service is assured by the advertiser if when writing you mention the California Cultivator.

CONSIDER STOCKYARDS FOR LOS ANGELES

At a meeting called by the Los Angeles Chamber of Commerce for the purpose of discussing plans for the establishment of union stockyards, the following committee was appointed to investigate the proposition and make a report upon which definite action will be taken: F. H. Scribner of the farm bureau, chairman; Charles Hill of Wilson & Company; Frank W. Hauser of the Hauser Packing Company; Charles O. Robinson of Clay, Robinson & Company, Chicago; W. I. Morrison of the Alfalfa Growers Association; A. D. Buckley, secretary of the Globe Grain and Milling Company; E. J. Bennett of Woodward-Bennett & Company, and O. B. Fuller of the C. H. and O. B. Fuller Company.

Among the speakers were A. D. Buckley, Charles O. Robinson, Fred Bixby, president of the California Cattlemen's Association, and D. J. Sheehan of Lone Rock Ranch.

Mr. Robinson, who is one of the best known livestock men in the United States, stated that both the producer and the packer would be benefited by union yards and declared that marketing through union yards would stabilize prices.

The following livestock men attended the meeting: O. B. Fuller of the C. H. and O. B. Fuller Company, D. J. Sheehan of Lone Rock Ranch, J. L. Knorpp of the Southwest Cattle Loan Company, T. W. McDermitt of the California Cotton Oil Company, W. I. Morrison of the Alfalfa Growers Association, G. H. Woodward of Woodward-Bennett Company, J. L. Bush of Clay, Robinson & Company, Frank M. Hauser of the Hauser Packing Company, C. M. Smith of the Producers and Users Company, Louis Degen of Degan Bros., C. S. Johnston of the Newmarket Company, A. D. Buckley of the Globe Grain and Milling Company, E. J. Bennett of the Woodward-Bennett Company, F. P. Allen of the United States bureau of markets, T. F. McKee of Clay, Robinson & Company, W. J. Doran of the City National Bank, G. H. Emery of the Alfalfa Growers Association, E. R. Gregory of the Santa Fe, A. F. Osterloh of the Goodyear Tire and Rubber Company, W. H. Roche of Degen & Roche, H. L. Musser of Aggeler & Musser Seed Company, C. H. Hill of Wilson & Company, Charles O. Robinson of Clay, Robinson & Company, C. H. Beauchamp of the livestock meat division of United States department of agriculture, James Cantlay, W. T. Bishop, J. W. Kemp, R. G. Hoskins, F. A. Pierce, B. G. Osborne, J. C. Austin, W. H. Daum, C. R. Thomas, C. H. Howland, J. A. Burton, Fred Bixby, F. H. Scribner, and Roderick Scott of the Cudahy Packing Company.

SAN JOAQUIN POLAND SALES NEXT WEEK

Few sections of this state have made greater progress in swine improvement than has been recorded in the San Joaquin Valley. Last week the highest price ever paid in the West for a boar of any breed was registered by a Fresno County Poland China. That fact is stimulating interest in the sales to be held at Fresno, February 11, and at Lodi, February 12. Each sale contains the blood of the record boar, Giant Bob, as well as of other prominent boars of the state.

The sale at Fresno will be held at the Fresno fair grounds and will consist of consignments representing the following boars: Big Bone Leader, Rossmead Big Bob, California Jumbo Buster, Giant Bob gilts and sows, as well as many others of excellent parentage, have been bred to Fresno Boy, Model Big Timm, Blue Valley King, Golden West King, Model Jumbo and California Bob Wonder.

Walter C. Ficklin, secretary of the Fresno County association, writes that the sale animals have been carefully selected and will be a credit to the breed.

The San Joaquin breeders who sell at Lodi are: George V. Beckman & Sons, Langhorst Bros., J. F. Lehman, Eugene Miner, all of Lodi; George Barton, Clements; Frank Dollard and Les McCracken of Ripon, and N. K. Horan, Lockeford. The offering is said to be the equal of any to sell this year.

BERKSHIRE ASSOCIATION'S CLASSIC

The widespread demand for catalogs for the Western Berkshire Congress sale at the university farm, Davis, Wednesday, February 18, indicates that buyers will come from all parts of the Pacific Coast, according to the report of Frank B. Anderson of Sacramento, secretary of the congress. At least one buyer is coming from Honolulu. The Berkshire people claim this year's offering to be just about the best lot of Berkshires that have been put up in consignment sale. In view of the fact that a $5 per head entry fee was charged for the sale, this to go into a fund for cash prizes, breeders were anxious to consign animals of the kind that would have a chance to bring home these prizes which are larger than those offered at any fair.

A large number of breeders have arranged to take in the entire Berkshire circuit, starting with the sale at Castleview Ranch, Santa Rosa, Saturday, February 14, thence to the state fair grounds at Sacramento for the H. C. Muddox & Son sale on Monday, the 16th, with the congress meeting at Davis on Tuesday, the 17th, and the sale the day following.

DUROCS STRONG IN LOWER SAN JOAQUIN

A feature of the Duroc-Jersey sales held in Southern California last week was the determination displayed by Tulare and Fresno breeders to secure the best. The tops of the two high sales went to Visalia breeders, and Fresno breeders took many of the best.

The introduction of such high class breeding material in the already strong herds of the lower San Joaquin bids fair to make that section a leading source of Durocs. The breeders held one very successful sale last summer and they will hold a sale of bred sows and gilts at Tulare, February 12. The purpose of the sale is to attract attention to the district and to afford an opportunity for beginners to select desirable foundation material. Many of the leading herds of the state have contributed entries.

FAMOUS WRITER TO BREED DUROCS

Peter B. Kyne, the well known writer and O. H. Cash have purchased the entire herd of Durocs owned by Fred Johnson, Napa, and plan to conduct a Duroc-Jersey breeding establishment at Sierra Vista Ranch near Perris. The deal, which is one of the most important ever made in this state included the boar King Orion Jr., that was secured by Mr. Johnson last fall. This boar was grand champion at the California International Livestock Show and when shown at the 1919 National Swine Show defeated six state fair grand champions. The purchase also included 23 top sows and 14 fall gilts.

BURR SALE ESTABLISHES RECORD FOR GRADE DAIRY COW

In the sale of grade Holstein cows held by the Burr Farm at Los Angeles, January 27, a new record was made when Mannie Mayo of Compton paid $510 for a grade cow. Every cow offered had been tested in the cow testing association and was sold on her record. The high prices that ruled for tested cows was most convincing proof of the value of cow testing associations. The 15 head of pure bred bull calves sold for an average of $163.

MILKING MACHINES POPULAR IN HUMBOLDT

B. D. Mason, state dairy inspector sends in the following information: "During the past year 110 milking machines of different makes were installed on dairy ranches in the Eel River Valley of Humboldt County. Out of 360 dairies in this valley, 110 are now using milking machines, or approximately 32 per cent. One-half of these machines are in use in the vicinity of Ferndale. Indications are that many more will be installed during the coming year."

The use of mechanical milking devices is no longer in the experimental stage. They are rapidly proving themselves a solution of the help problem for the dairy farm. Undoubtedly most of the complaints registered against these machines in the past have been due to improper care and handling of the outfit.

April 24, W. T. Dice and Harrold Waltz, Hanford.

Shetland Ponies

April 17, Butte City Ranch, Butte City.

Shropshire Sheep

April 17, Butte City Ranch, Butte City.

Next Thursday, February 12, the Tulare Duroc-Jersey Breeders Association will hold their third sale of bred sows and gilts. To make this sale attractive the breeders are disposing of some of their best animals and have consignments from some of the state's leading breeders as well. In speaking of the sale, Allen Thompson, president of the association, said: "We have had this sale in view for some time but we decided to postpone holding it until we felt that we could make an offering that would be representative in every way. We feel that this sale presents real opportunities both to the breeder and farmer."

Fifty-five students of the college of agriculture who formed the animal husbandry club at Berkeley are continuing the club this term while attending the university farm, Davis. W. H. Alison, a senior, has been elected president, and L. A. Crawford, also a senior, has been elected secretary. Meetings are held every two weeks for the purpose of discussing matters in connection with their courses in animal husbandry. Prominent speakears are scheduled to address the club on important agricultural topics. The men are particularly interested in forming a judging team to represent the institution at livestock shows.

Mong and Charleston of Whittier, are laying the foundation for a good herd of Durocs. They secured one gilt in the Diamond Bar sale and four in the Winsor Ranch offering.

W. T. Dice of Kings County, is in the East attending a number of the leading Poland China sales. Mr. Dice represented California at the record sales held at Kansas City last month.

In the L. H. Glover sale of Poland Chinas held at Kansas City, January 19, 46 head of sows and gilts sold for an average of $2,759.78. Fashion Girl, the dam of Liberator and Designer, sold for the record price of $17,200. At the Winn and Moore sale held at the same place, 40 head of sows and gilts averaged $1,629.37, and Model Giantess 3d sold for $11,300.

The state of California recently placed an order with the Castleview Ranch for a registered Berkshire boar for delivery to the Sonoma State Home, Eldridge.

Mrs. W. Anderson, the well known horsewoman of Kenwood, has just accepted delivery of a splendid young Berkshire boar, sired by "Achiever" from the Castleview Ranch, Santa Rosa.

Dr. S. W. McClure, for the last nine years secretary of the National Wool Growers Association, has resigned to become manager of the Cunningham Sheep and Land Company, Pilot Rock, Oregon. Dr. McClure is succeeded by Professor F. R. Marshall, formerly of the animal husbandry department of the University of California, and more recently with the United States department of agriculture.

Dr. S. S. Bogle, prominent physician of Santa Rosa, has purchased a ranch of 45 acres north of the City of Roses and will fit it up as a model breeding establishment for Berkshire swine. Much of the foundation has been secured from the Castleview Ranch.

J. Francis O'Connor, Castleview Ranch, Santa Rosa, reports sales of bred Berkshire sows to Messrs. Groff & Rippin of Merced and Jas. S. Pedrotti of Calistoga.

Castleview Ranch, Santa Rosa, has recently shipped Berkshire service boars to J. D. Krause, Melitta, California. E. C. Carpenter, Taft, California, and W. N. Nail, Manzanar.

V. F. Dolcini, owner of June Acres Farm, Davis, has sold to Hutchinson and Daisie, Walnut Creek, eight head of Duroc-Jersey gilts and a young boar.

Manager James McDonnell of the Ormondale Ranch, Redwood City, reports the sale and shipment to Peru of a Shorthorn heifer, daughter of Golden Goods Jr., and therefore a half sister to Little Sweetheart, the sensational champion developed by Thornton S. Glide.

H. A. Jastro, manager of the Kern County Land and Livestock Company, and one of the dominant factors in the cattle industry of this country, was reappointed chairman of the marketing committee of the American National Livestock Association at the annual meeting held at Spokane last month.

L. D. Thompson of Modesto, who maintains herds of registered Holsteins and Poland Chinas, reports having sold three yearling heifers to J. A. Kinney, Standish, Lassen County, and

Ord L. Leachman, Auctioneer

a cow to Macomber and Son of Modesto. Thompson also has sold four Poland China gilts to Shannahan and Hindman, Modesto, a gilt to Rossi Guy, Modesto, and a boar to J. W. Crane, Oakdale.

D. H. Bittner, general manager of the California Farm Marketing Association reports that during the 14 months ending January 1, 1920, the association held 191 sales of fat hogs in the counties of Kern, Tulare, Kings, Fresno, Madera, Merced and Stanislaus. The sales marketed 55,789 for a total of $1,917,416.86.

McCarty and Starkweather, Poland China breeders, Modesto, have recently purchased from Williams Bros., Villisca, Iowa, a young sow by The Yankee, carrying a litter by Long Boy, a son of Orange Boy. Other purchases includes a yearling sow by Long King bred to Giant Joe secured from Robinson Bros., Morton, Illinois.

Mrs. Sears of Bakersfield was a good bidder and buyer of registered Jerseys at the Arden Dairy sale at El Monte, January 23. Mrs. Sears also has the foundation for a herd of big type Poland Chinas. She owns the fine yearling sow Big Bone Maid 3d, daughter of Rossmead's Big Bob, with litter of eight by Big Timm.

H. A. Younkin of Corona reports the highest grade Holstein cow record yet to be announced. Under official test by the Riverside County Cow Testing Association the Younkin cow made 103.52 pounds butter fat in 30 days. The average for the entire string of 28 cows for the 30 days was 45 pounds of fat.

A. R. Doctor of Van Nuys has recently added to his fine herd of Poland Chinas one of the best brood sows sold in the McCune sale at Hanford.

The next annual meeting of the American National Livestock Association will be held at El Paso, Texas.

C. E. Park of Boyle Heights, Los Angeles County, was a recent buyer of high class Jerseys from the J. H. Kee herd at Lancaster. Mr. Kee and Mr. Park were both buyers at the Arden Dairy sale at El Monte.

Josh L. Wilson, Lamanda Park, Los Angeles County, was the buyer of two young Hampshire sows in the Underhill sale at Santa Barbara. One of them has a beautiful litter of ten fully belted pigs sired by a grandson of Gen. Tipton's Masterpiece. Another sow has fine litter of nine.

Geo. W. Thomas & Sons, Arlington, have 50 registered females in their herd of Jerseys at their Golden Glen Stock Farm. In early December they secured 30 females from the F. E. Molby herd at Fallon, Nevada, the young things carrying the close up blood of Noble of Oakland.

The Record Boar

Giant Bob, the $5,250 Poland China boar sold by Charles Gatewood to Alfred C. Buckland & Son, Fresno, and Z. M. Dickey, Dinuba. Giant Bob was grand champion at the 1919 state fair and is the highest priced boar ever sold at auction in the West.

DAIRYMEN MUST REDUCE COST OF PRODUCTION

Reduce the cost of production to increase the profits of the business, Dean Van Norman of the University of California farm, Davis, told the Sacramento-Yolo Cow Testing Association at a recent meeting held by the cow testers.

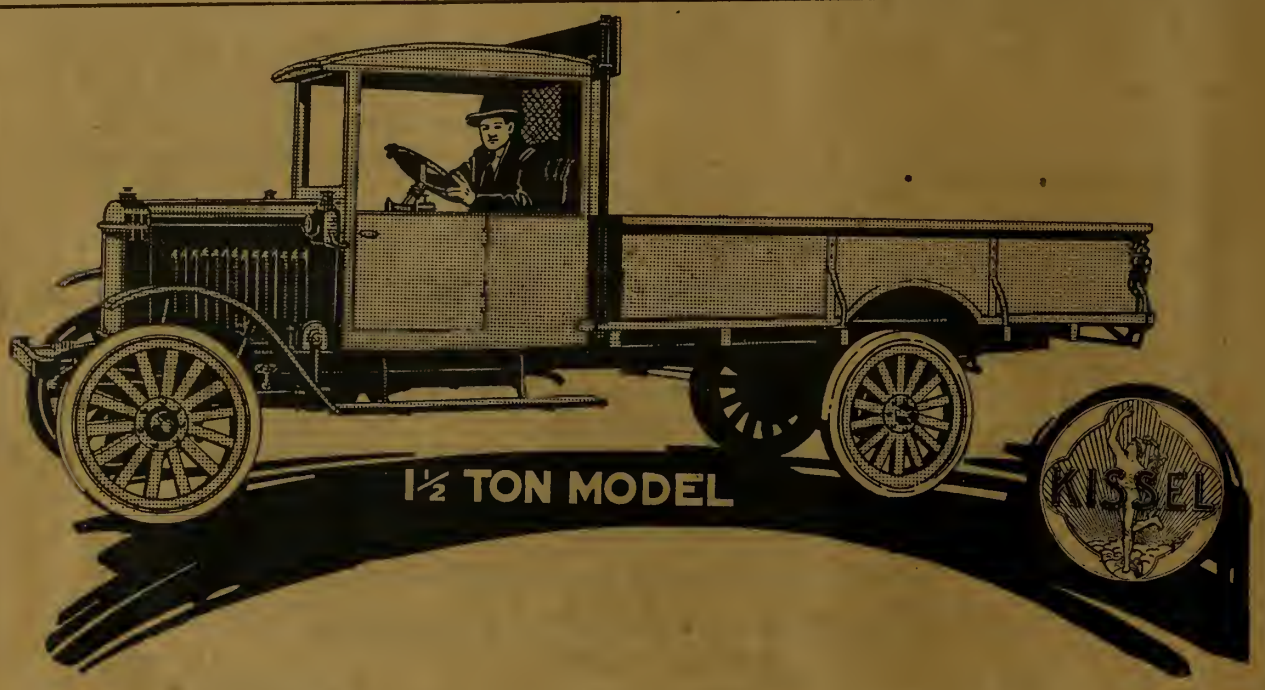
"Since the selling price received by one dairyman is substantially the same as that paid to his neighbor, he has little chance to change it; but the cost of production is in each man's hands. Some cows produce $1.25 worth of milk for each dollar of feed consumed; others, $2 to $3 worth. If 20 good cows produce as much milk and more profit than do 28 poor ones, why feed, milk and look after the extra eight for nothing? Why expect the city consumer to pay a profit on the poor cow, for the poorer the cow, the higher the price of milk must be.

"The price dairymen get for milk is not too high, compared with what they pay for shoes, stockings, dress goods, suits, flour, sugar, coffee, automobiles, plows, tractors, labor, or most other things they buy. Dairymen's profits, however, are too small. While thousands of cows produce from 500 to 800 pounds of fat per year, many are satisfied with cows yielding less than 200 pounds per year. And the state average is only about 160 pounds.

"Someone must raise more good cows to replace the poor ones which are slaughtered as fast as they are discovered. It can best be done by mating pure bred bulls to the highest producing cows in our cow testing association, bulls that come from families not merely of high production, but families of cows that have the habit of transmitting to succeeding generations the high producing power inherited by them."

CALIFORNIA SAFETY NEWS

The industrial accident commission announces that the California Safety News, its monthly publication, will be sent free to anyone interested, if notice is sent to the office of the commission at 525 Market Street, San Francisco. The various industrial activities of the state are considered in their relation to safety under appropriate headings, such as mines and tunnels, boilers, construction, electricity and elevators. The commission's engineers in charge of these divisions write special articles each month for the information of employers and employees, all with a view of telling about safe working practices and different methods of preventing industrial accidents. In this way there is a variety of subjects discussed and each employer and employee can find something of interest.



IN no other line of usage have Kissel Trucks proved their value more impressively than they have in the hands of some of the most successful ranchers of California.

¶ We would be very glad to furnish you with information concerning their experience.

FEED MARGIN AND SAFETY

(Continued from Page 193).

tion. The nutritious native grasses can not reseed, and soon die out. On the other hand, where no effort is made to crowd on every head possible, but rather a definite policy of understocking is pursued, the grasses get a good start and furnish better feed and at the same time reseed. The range improves from year to year. The stock grows out to better advantage, faces the off seasons in better condition and is generally more profitable and satisfactory. Some may argue that the general practice of understocking will seriously deplete the meat supply. Not necessarily. Along with modern range management must come the use of better livestock. Fewer head perhaps—but an equal poundage of better quality should be the aim.

There are few if any outfits in this state whose profits can not he increased by the wider use of better blood. The use of pure bred bulls of the right quality and stamp will grade up the cow herd with each cross and with this improvement the selling age of the steers be reduced. Two year old steers can be turned off weighing as much as the old time threes, and by such a practice range formerly needed for carrying the steers the extra year is made available for cows. Such a plan is not a mythical theory. It is absolutely practical and is being cashed in on by the shrewder operators.

The above suggestions are only a few of the many ways open hy which California livestock operators can turn their business from a nightmare of short feed into a profitable business in which many of the current hazards have been eliminated, and it is simply sound business to conduct operations along such lines.

What has been said concerning the range operator, can be repeated to the small rancher who is running beef or dairy cattle and lose none of the force. Hundreds of dairymen are now paying from $25 to $40 per ton for bay—and find it hard to get at those prices. Of course, many dairymen are so situated that they can not produce their own feed and therefore must buy—but the majority of dairymen are raising more or less feed—and nearly all of them can produce more. Too many are depending from year to year on buying what they need and every year at some time or another they get caught out of feed on a high market. Their hazard is no different from the beef or sheep man—and their problems are largely the same. More water is needed for irrigation; more alfalfa is needed; more silos are imperative; more silage crops must come. In sections where irrigation is difficult, dairymen need to investigate and learn to grow many of those crops that have been proven practical with little or no irrigation—but above all, the present situation should serve to convert hundreds of dairymen to the prime importance of silos and silage.

The dairyman, too, can largely alleviate the possible feed shortages by keeping fewer but better cows. No fact of livestock production is susceptible of more definite proof than that the use of a well bred pure bred bull will increase the production of a herd. If 25 well bred cows will produce as much as 30, 40 or 50 poorer cows—the saving of feed will be considerable and the man who is now paying $40 per ton for hay will experience a sense of relief comparable to few sensations.

The way has been marked and the livestock interests of California should resolve that 1920 will see advantage taken of any plan of operation tbat promises relief.

URGES BETTER BULLS FOR THE RANGE

Chas. U. Pickrell, extension animal husbandman of the University of Arizona, is carrying on a state campaign to help put the scrub bull out of business.

Here is tbe way he summarizes the situation for cattlemen:

"For the past two or three years the difference in price between well bred cattle and scrubs has not been as great as it should have been. There has been some difference in the selling price of yearlings and steers of better breeding and scrubs but not as much as there should be. In the struggle to secure cattle, buyers have taken cows at a more or less general price, and growers in haste to remove stock from the range during a dry period, have sold their female stock at a general price per head. The man with scrub stock has benefited by this condition and the grower who bas been making an earnest endeavor to improve his stock has not received the difference in price that he should.

"However, this condition is fast changing. Sales this past fall showed a difference in price of as much as $5 per head for yearlings in some cases. At present the price of cows shows a variation of $10 to $15 a head, according to tbe breeding of the animal.

"If the cattleman will look around a little he will see how much easier the producer of well bred cattle has disposed of his stock. He will also nearly always find him selling to the same buyer year after year.

"The producer of scruh cattle may find a market for his cattle, but it will not be to the same buyer two years in succession, unless he sells at a much reduced price. In fact a good buyer does not care to handle scrub cattle at all if otber cattle can be found. Buyers who have handled scrub cattle in the past have in turn passed them on to feeders who have lost when they placed tbem on the market.

"With tbe present price of land a feeder has no place for a scruh. Securing cows of better breeding is probably out of the question for many at present, but the bulls for use this coming year should be selected with greater care.

"When figuring on the price per head for bulls that a grower can afford to pay the cattleman may well multiply the number of yearlings per bull by five. The product would represent in dollars what a man can afford to pay for a pure bred bull above the price of a scrub bull.

"If possible purchase registered bulls as well as good individuals. A beef bull for breeding should have good conformation, good size and the sex character developed."

Cross-section of typical tractor engine showing where the oil is greatly heated.

Engine troubles—90% preventable

Burned out bearings, overheating, lack of power are caused by failure to lubricate properly

ONE man has trouble with his engine—another one does not. What is the difference?

In nine cases out of ten, engine trouble in automobiles, tractors and trucks is preventable. This is the verdict of automotive engineers, practical repair men and dealers after years of study.

It is the tremendous heat at which engines operate which makes lubrication a problem. Ordinary oil breaks down under this terrific heat—200° to 1000° F. Large quantities of sediment which has *no lubricating value* are formed. The lubricant evaporates like boiling water. The oil in the sump is contaminated and thinned down by fuel.

As a result carbon forms rapidly, bearings soon burn out and the engine overheats. Serious engine trouble soon results. Because the tractor works at higher temperature, these evils are exaggerated in its case.

Ordinary oil after use *Veedol after use*

Sediment formed after 50 hours running in a tractor

Solving lubrication problems

To overcome these difficulties engineers of the Tide Water Oil Company developed the famous Faulkner process used exclusively to produce Veedol, the lubricant that resists heat. How Veedol resists heat is clearly illustrated by the sediment test on the left.

The proper grade of Veedol for all engines not only reduces by 86% the amount of sediment formed, but prevents excessive contamination. Because it reduces evaporation to a minimum, Veedol gives from 25% to 50% greater service per gallon.

Recommended for most fine tractors

Veedol Special Heavy is recommended by most Fordson dealers. Many manufacturers recommend it for their machines, including: Allwork, Moline, International Harvester, Bates Steel Mule, Parrett, Case, Hart-Parr, Emerson Brantingham, Weidley Tractor engines, American, Wallis and most prominent motor car and truck manufacturers.

Leading dealers have Veedol in stock. The new 100-page Veedol book will save you many dollars and help you keep your tractor, car and truck running at minimum cost. Send 10c for copy.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Garget: Inflamed Quarter

We have a young Jersey cow that has lumps in her milk. Her udder and one teat will swell up and be inflamed and the milk in that teat will he lumpy for two or three days at a time. She has been that way twice since she was fresh in Septemher. Do you think she might have tuherculosis?—Suhscriber, Dinuba.

She might have tuberculosis but she could have the trouble you describe without having tuherculosis. When cows are fed highly ahout calving time the blood is apt to be too thick and rich and that causes congestion of the udder. A week or two before calving a cow should be fed very sparingly and about that time given a dose of salts; that will thin the blood and they very seldom have any udder trouble. When the udder becomes very full of milk even before calving it should be milked out to relieve the pressure and this also will help to prevent congestion or inflammation. Congestion causes the milk to coagulate and come in lumps until the inflammation suhsides. This is apt to recur at intervals as in your case. The remedy is to thoroughly rub the udder and milk it out clean regularly, also give her salts in her feed to thin the blood. Mix three pounds of epsom salts with two pounds of common salt and give her a handful in the feed once a day for a week or two. If the trouble returns give her more salts.

Frozen Teat

I have just brought a car of stock from the East and in the car was a young heifer with a calf. The weather was very cold at the time of starting and one of her teats hecame frozen. This made the teat very sore and she refused to let the calk suck, and as it was not possible to milk her regularly she sometimes went a day without being milked. Now the milk in that teat is very thick and a very small quantity comes out. From the remaining teats she gives a large quantity of milk and she seems to be in the best of health. I can not think it is of tuhercular origin as she was tested about 30 days ago and gave no signs then. Please advise me what to do. — Subscriber, Bakersfield.

By thoroughly rubbing the quarter and milking it out regularly you may be able to save it. It could easily occur without her having tuberculosis. Read the answer in this column under the heading "Garget: Inflamed Udder."

Fistula

I have a horse ahout nine years old weighing 1,600 pounds, gentle and sound, but has a fistula started last spring. I have had him two months, have worked him some but he has been running out now for some time. Can he he cured and what would do it? About how long would it take?—Subscriber, Tulare.

Fistula is hard to heal as it is a deep abscess on the top of the shoulder and the cavity that contains the pus is below the opening so it will not drain. Also the parts where such abscesses form have very little hlood supply so the process of repair is slow. When pus discharges for a time from such an ahscess nature forms a false skin or membrane around the cavity and the canal through which the pus flows. That membrano is called a pyogenic or pus forming membrane and will continue to form pus as long as it is allowed to remain thero and must be gotten rid of before the pus will stop and allow the wound to heal. The opening should be enlarged so you can reach the bottom of the cavity. The pus should be all washed out and the cavity scraped just enough to start the blood all over the surface. Then to keep it clean and healthy so it will heal it should be packed with surgeon's cotton or gauze which is saturated with a weak solution of iodine. This packing should be removed, the parts cleaned and the packing renewed every two or three days. No one can tell how long it will take to heal it but one of long standing like yours will usually heal much quicker than one of recent origin. If properly cared for it should be sound in two or three months.

Dog With Distemper

We have a dog that has a hacking cough and gags, spitting up a white froth, and his eyes look weak. He eats bread and meat. What do you think is wrong with him and what can he done for him?—Subscriber.

The symptoms you describe are those of distemper. Unless it is properly treated at the start it is apt to leave the dog with a weak stomach and a discharge from the eyes and nose. Give five or ten grains of calomel (according to the size of the dog) at night and in the morning mix as much salt as will dissolve in a teacup of hot water and when cool enough so you can hold your fingers in it give him as much of it as you can get down him. This will make him vomit and clear out his stomach. After that give him five grains of salicylate of soda on the tongue once a day for two weeks.

BUTTE FAT HOG AUCTION

The first farm bureau fat hog auction sale in Butte County was held at Durham, the home of the state land settlement colony. The sale was a demonstration, being one of the first farm bureau sales to be held in the Sacramento Valley.

The success of the sale was unqualified. The two top cars averaged 14½ cents per pound, which was one cent above the local market on that day and two cents ahove the average price in the county during the week previous to the sale. Hogs were offered by 30 growers. Nine huyers were present to bid on them, one coming from as far as Los Angeles. Over 400 farmers witnessed the auction. The success of the sale was due largely to the efforts of the committee appointed from the Durham farm center and of George Kreutzer, manager of the colony and originator of the farm hureau hog sale idea. O. S. Grant cried the sale.

The increased prices offered at Durham were due to the fact that the huyers were offered graded hogs in carload lots. This is an advantage to the buyer hecause he is saved the cost of assembling the animals. For the farmers the cost of assembling was very low and they were all given the opportunity of selling at carload prices even though they had only a few hogs to offer. All hogs were carefully graded before being sold. This is an advantage to the grower who finishes correctly. The top car always brings the highest price. Many growers are not particular enough about getting the proper finish on their animals. It is a matter of education to them to see properly finished hogs at these sales and to watch the correlation between good hogs and good prices.

Now that the idea of farm bureau hog sales has been proved out in the Sacramento Valley there will no doubt be many sales held. Probably a chain of sales will be started similar to that in tho San Joaquin Valley where buyers are able to go from one to the other. This would stabilize the hog market considerably and stimulate the hog industry throughout the northern soction of the state.

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body — It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Boils, Corns and Bunions. CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

ANCHORAGE FARM MAKES BIG BERKSHIRE SALE

Mrs. Ruth Hardy, manager of the Anchorage Farms, Orland, writes that she has just closed an important sale consisting of 50 head of registered Berkshires to the Modoc Land and Livestock Company, Cedarville. The sale includes five daughters of Star Leader, bred to Natomas Baron Duke; 16 bred gilts; 16 open gilts that will be bred to Natomas Baron Duke; ten sow pigs, six and seven months old and three bred sows.

In reporting the sale Mrs. Hardy said: "The herd was selected and will be managed by Charles Barrows, Berkshire breeder. The Modoc Land and Livestock Company owns 2,640 acres of fertile land, all under cultivation. A railroad is now being constructed which will open this ranch to Portland and the East. The farm is to be superintended by Mr. Brown, now with the Napa State Hospital. A large part of the acreage is in alfalfa where it is planned to run pure bred herds of hogs, sheep and cattle, and they have adjacent pasture. Water conditions are ideal, there being a number of artesian wells on the place. The managers were influenced in their decision to have pure bred Berkshire hogs on their farm by the winnings of the Napa State Hospital at the California International Livestock Show where the grand champion carload was won by this breed, and the carload was sired by a son of Star Leader, so they wish to make their foundation herd daughters and granddaughters of this boar. A number of the sows and gilts selected are bred to Natomas Baron Duke, the grand champion of California. They were also attracted to Anchorage Farm by the sow exhibited by the Webber children with her ten pigs. Mr. Owens purchased this sow at the time and sent her up to Anchorage Farm to be bred again. This large sale completed a very successful year for Anchorage Farm."

LIVESTOCK WEEK AT UNIVERSITY FARM

Preliminary plans for the Livestock Week to be held at the university farm, Davis, the last week in February have been announced. The entire week will be devoted to livestock activities and it is hoped that many things will occur to shove the industry ahead. February 25, the Pacific Coast Hereford Breeders Association will hold their semi-annual sale; the following day the California Shorthorn Breeders Association will sell 60 head of bulls and females. The California Swine Breeders Association will meet in annual session Friday, February 27 and during the day the California Poland China Breeders Association will hold their initial sale of bred sows and gilts. Saturday will be "Dairymen's Day" and it is expected that representatives of many cow testing associations will attend. Herd improvement through the use of pure bred bulls will be stressed. A small auction sale of young bulls of the leading breeds is being arranged.

STALLION REGISTRATION RENEWALS

Last year there was a total of 583 stallions and jacks registered in the state. The results so far seem to indicate that the total number will be slightly increased this year. In 1912 the registrations totaled 2,034, a decrease in seven years of 1,451 animals. Here is food for thought for all persons interested in the livestock development of California.

SAN JOAQUIN POLAND BREEDERS ANNOUNCE SALE

The second sale to be held by the San Joaquin County Poland China Breeders Association has been scheduled for February 12 and will be held at Lodi, so Sherwood Beckman, secretary of the organization writes. The consignments come from the following breeders: Geo. V. Beckman & Sons, John Boskovitch, N. K. Horan, Langhorst Bros., J. F. Lehman, Eugene Miner, Young & Barton and Young & Clark. Forty head of sows and gilts will be sold and it is stated that a special effort has been made to present an offering that will be a credit to the breed and the association. The sale, as is the case with many others, is arranged as part of the wide spread propaganda for better hogs.

The Bell Cow for Profit

Jersey Cows don't eat merely to live, but to produce the richest quality of milk from the smallest amount of feed. They are the money-makers.

Any breeder will tell you that a dollar's worth of feed goes farther and yields a greater return when fed to a Jersey. Jersey Milk averages 5.37% butterfat. Jersey Milk, Jersey butter and Jersey cheese bring the biggest prices on the market.

J.EREY

Breeders will tell you that the Jersey is the Pride-Prize-Profit breed. Let us tell you why the Jersey is *the* investment cow! Write for free literature about Jerseys.

Prince Walker Cornucopia
The Highest Record Son of Prince Gelsche Walker

His dam ALBA SADIE CORNUCOPIA CREETA has just completed official records of 36.26 pounds butter from 516.7 pounds milk in seven days. Her previous records were as follows:

At seven years—
Milk 338 days 13,849.40
Butter 866.23
At six years—
Butter seven days 34.13
Milk 532.40
At five years—
Butter seven days 28.85

She is a daughter of Sir Sadie Cornucopia, son of the first 30 pound cow, Sadie Vale Concordia.

Over 60 of our best females are bred to PRINCE WALKER CORNUCOPIA, and he will be given the fullest opportunity in this herd. Put one of his young sons at the head of your herd.

JERSEY FUTURITY STAKE

By Guy H. Miller

At the last meeting of the California Jersey Breeders Association the matter of the Jersey Futurity Stake was discussed at some length. This stake, founded about six years ago, has been allowed to lapse and go by default for the past two or three years on account of lack of entries and failure to qualify heifers in the stake at time of freshening. It was decided to make some change in rules and entry fees and open the stake anew, with the result that nine breeders have made entries of heifer calves as follows: Bonnickson Bros. of Ferndale, seven heifers sired by Financial King B. No. 160748, one helfer sired by Queen's Cicero of C. V. No. 159987, one helfer sired hy Cicero's Golden Oxford No. 144463; J. E. Thorp of Lockeford, one heifer sired by Jolly Senator Raleigh No. 114508; J. W. Coppini of Ferndale, one helfer sired by St. Mawes of Ferndale No. 154942, one helfer sired by Gamboges Cannon No. 151607; W. B. Stuell of Orland, three heifers sired by Alzy's Undulatta Oxford No. 160531; E. E. Greenough of Merced, one heifer sired hy Opas Golden Fern No. 165024; University of California, two helfers sired by Susy's St. Mawes No. 135577, one heifer by Owl of Belleview No. 106305; E. W. Doane of Merced, one heifer sired hy Baron Underwood No. 133198; C. D. Hayworth of Modesto, four heifers sired by Silkies Golden Glows Chief; one heifer sired hy Lorna's Altama Interest No. 108420; Guy H. Miller of Modesto, five heifers sired by Jap's Perfection Owl No. 160572, one heifer sired by Altama Interest No. 98466. A total of 31 head of heifers sired by 15 different sires of many different lines of Jersey breeding. This makes an excellent entry list for stake number seven, particularly so as it was open for entries but two months.

This futurity stake is a butter fat contest of one year duration for helfers under 30 months of age at time of starting on test. The heifers must be tested under the rules of the American Jersey Cattle Club for Register of Merit tests. This will be an annual event. Heifers must be entered before they are a year old. If entered before six months old the entry fee is less.

Stake No. 8 is now open for entries and will not close until December 31, 1920. For full information and entry hlanks Jersey breeders should address tbe secretary, Prof. V. C. Bryant, Agricultural Hall, University of California, Berkeley.

If all the 31 heifers now entered in stake No. 7 to be contested for in 1921 qualify at time of calving and start in the contest it will make a contest of unusual interest and attract wide attention in livestock circles of California.

DISTRIBUTION OF COSTS IN PORK PRODUCTION

Income tax reports put tbe question of farm records squarely up to every farmer. In the meantime expensive feed and costly labor frequently disturb the feeder's sleep by inquiring where he expects to get off.

Tbe farm is not like a factory in which every item of expense is very closely known in advance. On tbe contrary, weather conditions constitute a big unknown quantity which may cause heavy losses of young stock, cut down the yield of crops, or by keeping men out of the fields greatly increase labor cost. Hence farm records are on a different basis, but none tbe less important.

While the pork producer is interested in costs as determined for operations of the entire year, data on shorter periods is wortb while and may help him to get a better line on the whole proposition. A Kansas test covered but a 100 day feeding period. Labor costs are higher than would be necessary where larger groups are handled. Prof. Ferrin reports the results as follows:

Five lots of pigs were fed by hand for 100 days, October 19 to January 27. An average of results for the five lots show tbis distribution of expense: Feed cost, 82.75 per cent; labor, 10.51 per cent; vaccination, 2.62 per cent. Interest (eight per cent), 1.83 per cent; equipment, 1.31 per cent; unaccounted for, 1.7 per cent; total, 100 per cent.

It will be noted that risk is not estimated or included.

Labor was charged at 30 cents per hour, while corn was $1.58 per bushel, tankage $100 per ton, oatmeal and peanut meal $60 per ton and semi-solid buttermilk $80 per ton.—Duroc Bulletin.

THE THIRD NATIONAL SHORTHORN CONGRESS

The congress idea has become quite generally adopted in improved livestock circles and serves a broad and useful purpose. The congress was first applied to the Shorthorn interests in particular in 1918 and the results were of such a far reaching contact that it was decided to place the National Shorthorn Congress on a permanent basis. The third event will occur at Chicago, February 17, 18 and 19, in the International Livestock Building, with the headquarters as before at tbe Stock Yard Inn.

One of the important rules in force from the beginning is tbat no individual breeder or firm may enter for the show contests more than ten animals. This rule was adopted for the purpose of making the show, which is a most important feature of the occasion, as widely representative as possible and to encourage beginners and owners of small herds. It is required of those making entries that the animals be of a high order of individuality. As an attraction $5,000 is appropriated for prizes and the class awards extended from 15 to 20 places in the various classes. The possible cash winnings mount up to a liberal sum and offer an inducement to the breeders who have animals of superior merit to enter tbe contests.

Another rule that is applied is that every animal entered in the show contests must be sold in the sale. From 250 to 300 high class Shorthorns pass through tbe congress sale each year.

As heretofore, speakers of international acquaintance and standing are scheduled for addresses. The affair in this respect will be highly educational just as it will be educational through the show and sale features. The purpose has been to place the Shorthorn Congress on a high plane. The program is designed to appeal to all observing folks regardless of whether they are directly identified with the Shorthorn interests or not. If the present plans do not miscarry the forthcoming congress will surpass in every respect those that have preceded it.

The American Shorthorn Breeders Association is to be commended for the high conception of the value and possibilities of tbis annual affair, and all improved livestock interests are benefited as a result.

The day of the husbandman is at hand and in its coming the welfare of all useful industry is fostered.

MORE GRAZING IN NATIONAL FORESTS

The demand for range on tbe national forests was greater the past year than ever before in the history of the forest service. Especially in the drouth stricken regions, stockmen, using the unreserved public domain or private pastures, eagerly sought forest permits in order to save their stock. The value of the system of range regulation in use has been so thoroughly demonstrated that representative stockmen from all the western states have declared emphatically in favor of placing the remaining unreserved puhlic lands under federal control and having them managed under a plan similar to that in effect on the national forests.

SAN BERNARDINO COW TESTING ASSOCIATION

Prof. C. V. Castle sends table showing names and records of cows of the San Bernardino County Association which are producing more than 50 pounds of fat. The list shows 21 on the honor roll. The topper was from tbe dairy of J. B. Metzley of Chino. Cow "No. 96" produced 1,695 pounds milk and a total of 81.36 pounds fat. The next honor cow was in the dairy of P. Farell, Ontario, which made a record of 73.32 pounds fat.

Manufacturers used about 60,600,000 pounds of wool, grease equivalent, in November, 1919, or slightly more than 8,000,000 pounds less than the amount consumed in October. The November, 1919, total exceeded that for the same month in 1918 by approximately 13,400,000 pounds. Totals by condition, in pounds, for November, 1919, as given by the bureau of markets, United States department of agriculture, were: Grease, 43,147,921; scoured, 7,605,982; pulled, 1,674,951.

This Healthy Brown Swiss

won a national Senior Championship at 3 years. She is a record milk producer.

Cultivate health, and the milk pail will show instant improvement.

What Makes Heavy Milkers?

Good breeding and good feeding are by no means the biggest factor. Perfect **HEALTH** is the master key. The constant strain of milk production will in time wear down the disease-resistance powers of the most rugged system. The digestive and genital organs are the first affected. Nature must be given medicinal assistance.

KOW-KURE is a cow medicine designed to help solve the health problems of cow owners. By directly affecting the organs where disease lurks, this medicine is successful in treating or preventing Abortion, Retained Afterbirth, Barrenness, Bunches, Scouring and Milk Fever. Try a treatment on your poorest milkers and note results. Feed dealers and druggists sell KOW-KURE; 60c and $1.20 packages.

KOW-KURE

YEAR'S TEST IN VENADERA HERD

Guy H. Miller reports work of two heifers that have recently completed yearly Register of Merit tests in Venadera herd of Jerseys. Both are daughters of the same cow and both started on their yearly tests as three year olds, but they are not twins. The older one, Zama of Venadera, started as a senior three year old, being a few weeks under four. For the year she gave 9,389 pounds of milk with an average test of 5.49 per cent butter fat, making 515 pounds of butter fat. Zama was sired by Owl of Belieview and is his highest tested daughter. This bull was used a season in Venadera herd but now heads the Jersey herd at the university farm at Davis. He has seven daughters in the Register of Merit. Zama made a test of 370 pounds of butter fat as a two year old with first calf. She is a remarkably persistent worker, is due to freshen again in March and will be heard from in further Register of Merit work.

Angela of Venadera, the younger of these half sisters, started her year's work as a junior three year old, being a few weeks over three years of age at time of starting. For the year she gave 7,605 pounds of milk with an average test of 5.63 per cent fat, making 428 pounds of butter fat. Angela was sired by our senior herd sire, Altama Interest, sire of 12 daughters in Register of Merit. Angela made a test of 380 pounds of fat as a two year old with first calf and is also a very persistent worker. Angela is also quite a show animal. Beginning as a calf she has been shown every year and has won first premium six times. She is due to freshen in March and will be started on test again. These two heifers were fed and milked but twice daily while on test and ran with the rest of the herd through fair weather and foul.

The dam of these two heifers is Belle of Venadera, Register of Merit test 460 pounds of fat in a year. She is one of the 14 Register of Merit daughters of Marigold's Exile King. Like her two daughters she was bred and tested in Venadera herd, but she was sold a few years ago to Dr. Hand of Orland as one of the foundation cows for the herd he was then establishing.

Cygna of Venadera, a four year old daughter of Owl of Belieview in Venadera herd, has also recently finished her second Register of Merit test. Starting as a junior four year old she gave 7,457 pounds of milk with an average test of 5.60 per cent, making 417 pounds of butter fat. Her previous Register of Merit test was 267 pounds of fat made starting before two years old. Her dam is Astrea of Venadera Register of Merit test 370 pounds of fat as a senior yearling, one of the Register of Merit daughters of Altama Interest.

WELL KNOWN DAIRY EXPERT ESTABLISHES DAIRY

Noel Negley, widely known for his work in promoting cow testing association work in Wisconsin and more recently in the West, has bought a ranch near Escalon in the South San Joaquin and is now actively engaged in developing it with the intention of placing a dairy on it.

For many years Negley did notable work in pushing cow testing association work in Wisconsin. For a considerable time he did dairy extension work in the South for the United States department of agriculture, and for the past year he has been connected with the Western office of the dairy division of the United States department of agriculture in the capacity of specialist in cow testing association work. He has done much writing for the leading dairy journals.

After Negley in the course of this work had the opportunity of familiarizing himself with the conditions of dairying over large areas of the Central states and also of the South, and after having visited in the past year most of the important dairying districts of the West, he decided that California was the place for him when he got ready to go into the dairying business for himself.

"MAD ITCH" OUTBREAK IN CATTLE

According to Dr. J. P. Jacks, extension veterinarian of the bureau of animal industry, stockmen of Arizona should be on the lookout in their herds for hemorrhagic septicemia, also called "mad itch," and immediately upon its appearance in the neighborhood inoculate all animals with a preventive vaccine which has been developed. This vaccine may be secured through the office of Dr. R. J. Hight, state veterinarian at Phoenix. G. L. Harris of the Salt River Valley has just lost 13 head of cattle from this malady. Both beef and milk animals were affected and the fatter animals seemed most susceptible. The symptoms are intense itching of the animals causing them to scratch against wire fences and sharp sticks to the point of serious injury to themselves. Slobbering of the animals is a symptom attending the disease. It is a disease of the blood and responds to vaccination.

THE BECKMAN SALE OF POLAND CHINAS

Geo. V. Beckman and Sons held their first public sale in Lodi, February 27. The Beckmans are located right in the heart of one of the state's greatest fruit growing centers and are making a strenuous effort to build up the pure bred livestock industry in their community. The offering consisted of about 20 bred sows and gilts and 20 open gilts. Those selling bred brought very satisfactory prices, while the buyers did not take kindly to those selling open. The top of the sale was the yearling sow, Matchless Jane by Matchless Big Bob, their senior herd sire, Langhorst Bros., Lodi, being the purchaser at $300. Hale I. Marsh, Modesto, secured one of the best buys of the season when he secured the March gilt, Marja, for $245. She was sired by Big Square Jumbo, and out of Margaret, being purchased in dam from J. E. Maharry, Illinois, and is one of the best spring gilts to go through a sale this season. Les McCracken, Ripon, secured a good fall yearling in Miss Miami for $215, the remainder of the offering selling for from $80 up and remaining in the vicinity of Lodi. Ord L. Leachman was the auctioneer.

FOURTEEN POUNDS ONE STONE

The letter from England which appeared on page 77 of the issue of January 17 was most interesting to the California reader, and some of the more observing ones have noticed reference to the ox, winner of the first prize at the Smithfield show, which weighed "300 stones (1400 pounds)." This short quotation from Mr. Raine's letter had two errors for which the editorial room will not accept responsibility. This, because of an accident in the press room causing injury to this line of type. In changing "stone" became "stones" and "(14 pounds)" became "(1400 pounds)". Now a 1400 pound stone or a 1400 pound ox, whichever construction may be put upon it, would be rather remarkable. But as it should read, 300 stone (14 pounds), would mean 4200 pounds, or, as Mr. Raine suggested, some ox.

FEED COWS COCONUT MEAL AT UNIVERSITY FARM

It is safe to feed cows one pound of coconut meal for each three or four pounds of milk produced per day, according to results of a period of experimental feeding just completed at the University of California farm, Davis. It is stated that some dairymen find it advantageous to feed as little as one pound for each six pounds of milk for each cow per day.

Coconut meal is one of the best concentrates on the market in California, farm authorities declare, and as a rule is relatively low priced.

BOGUS INSPECTORS AT WORK

Reports have come to the state department of agriculture that in some of the counties of the state the attempt is being made to sell disinfecting preparations to dairymen by sellers representing themselves as dairy inspectors. Dairymen must know that if any man comes to them selling goods that is a sure sign he is not an inspector.

Arrangements are being completed for the annual meeting of the Western Berkshire Congress that will be held at the university farm, Davis, February 18. Following the usual custom, a sale of bred sows and gilts will be held in connection with the congress meeting. The Berkshire breeders have long made their annual sales important events and the high standard set by former sales is expected to be maintained next month.

"FEEDFINE" FEEDS

	are scientifically compounded in proper proportions for dairy and all livestock feeding, of the following ingredients with the most economical results always in view.
YEAST	A concentrate high in PROTEIN and FAT content, sterilized and predigested.
CANE MOLASSES	The richest of feeds in carbohydrates—produces increased appetite on account of its palatableness. Its consumption results in increased energy and it is the best tonic known for animals.
ALFALFA MEAL	Gives body to the ration and supplies the mineral matter which is absolutely essential to all animals.
	The greatest known combination for health, strength and productiveness.

The Poultry Producers Convention

By Jean A. Koethen

FRIDAY, January 30, was the big day of the Poultry Producers' Association of Southern California, the day when poultrymen from the five southern counties met to elect directors and hear reports of officers for the year just closed. The meeting was held in the Poultry Producers' building on Industrial street, Los Angeles, and was attended by every poultryman who could be there, to say nothing of a sprinkling of poultrywomen. They came from San Diego and San Bernardino, from Orange and Riverside. The block in front of the building was lined with all sorts of motor vehicles, from flivver to Cadillac. Professor Dougherty was there, and Farm Adviser Hodgson of Los Angeles County and his assistant A. J. Gordon, most everyhody who is anyhody in poultrydom, in fact. They were a jolly crowd, a good looking crowd, and a notably prosperous looking crowd. Room had heen made hy clearing out the egg cases and lumher in the rear of the second story of the building to seat nearly 300, and every seat was filled. At noon a buffet lunch was was served to everybody on tables made of egg cases and the meal was enjoyed in the farmer's whole-souled fashion. It made one proud to be the owner of even a single hen.

Notable Progress

The year 1919, according to the report of the genial president, J. M. Davison, was one of great progress. While production has been curtailed in most lines of business the poultry producer has gone ahead, and the whole poultry industry is progressing by leaps and bounds. We are just on the eve of a great expansion. If there was ever a time when cooperation and wisdom in handling produce and opening up markets was needed it is right now. The Poultry Producers Association now numbers 475 members. It marketed during 1919 2,696,310 dozens of eggs, with a value of $1,349,245, and 50,660 cases of eggs were packed for storage. Twenty thousand cases of eggs found their way to outside markets; and the need of outside markets grows as production increases.

Owing to the increased cost of labor and supplies the business can no longer be handled for two cents per dozen eggs, and at the last meeting of the directors 2½ cents was authorized.

Good Prices Expected

The manager, Mr. Stanley, was highly commended hy the president for his efficient marketing, and was received with applause when he came forward to make an informal report. Comparison of prices today with those of a year ago, he said, showed that where eggs were selling at 40 cents wholesale a year ago, they were 48 cents on the corresponding day this year. Contracts are now being made for April delivery at 43 and 43½ cents for storage, and prices are not likely to go much lower, certainly not below 37 cents, the lowest market last year. There were more eggs in the warehouses last year than ever before. Many packers lost money, hut the organization through careful management has come out ahead. Shipping of eggs to New York hegan in October and has increased from a car every other week to five cars a week. As a rule prices received in New York are a little better than Los Angeles market. For instance, when the Los Angeles market was 48 cents 53 cents was received in New York; when the Los Angeles quotation was 85 cents, New York was 77 cents. It is necessary, however, that eggs be more carefully graded to meet the requirements of the New York market. Tinted eggs are not wanted and checks and dirties must be kept at home for immediate sale.

Cost of handling has increased tremendously. Where competent men could be secured four years ago at $2.50 per day, no help can now be had under $4 per day, and the cost of lumber and nails goes up by leaps and bounds. The only remedy for this increased cost is a corresponding increase in the number of eggs handled. Fifty per cent more eggs could be handled in the building with very little more help. More members in the association is therefore the logical solution to the problem. The membership has increased from 30 to 40 per cent the past year and will no douht continue to increase since the Poultry Producers has made good its promise to stabilize the industry.

Mr. Stanley emphasized the fact that eggs for storage must not be washed, and promised to let shippers know when washing must be stopped. Washed eggs are satisfactory for the local market hut they do not keep in storage. If eggs must he washed, they should be marked "washed."

Demonstration Meetings
